

# California State University, Fullerton Master Plan Update

Final Environmental Impact Report  
State Clearinghouse No. 2019080575

*prepared for*

**California State University, Fullerton**  
800 North State College Boulevard  
Fullerton, California 92831

*prepared with the assistance of*

**Rincon Consultants, Inc.**  
250 East 1<sup>st</sup> Street, Suite 1400  
Los Angeles, California 90012

**July 2020**

**RINCON CONSULTANTS, INC.**

# Table of Contents

---

Acronyms and Abbreviations .....	ix
Comments and Responses to the Draft EIR .....	1
Executive Summary .....	ES-1
Project Synopsis .....	ES-1
Alternatives .....	ES-3
Areas of Known Controversy.....	ES-4
Summary of Impacts and Mitigation Measures.....	ES-5
1 Introduction .....	1-1
1.1 Project Requiring Environmental Analysis .....	1-1
1.2 Purpose and Legal Authority .....	1-2
1.3 Scope of this EIR .....	1-2
1.4 Lead, Responsible, and Trustee Agencies .....	1-3
1.5 Environmental Review Process .....	1-4
1.6 Draft EIR Content.....	1-6
2 Project Description.....	2-1
2.1 Introduction.....	2-1
2.2 Campus Location .....	2-1
2.2.1 CSUF Campus .....	2-1
2.2.2 Surrounding Land Uses .....	2-1
2.3 Existing Campus Conditions .....	2-2
2.3.1 Existing Campus History and Master Plan Background .....	2-2
2.3.2 Student Enrollment, Faculty, and Staff: Existing Populations and Projected Growth .....	2-6
2.3.3 Existing Campus Conditions .....	2-7
2.3.4 Existing Campus Access, Circulation, and Parking .....	2-20
2.4 Project Objectives.....	2-22
2.5 Project Characteristics.....	2-23
2.5.1 Campus Districts.....	2-24
2.5.2 Academic Facilities .....	2-25
2.5.3 Residential and Student Life Facilities .....	2-26
2.5.4 Athletic and Recreational Facilities .....	2-30
2.5.5 Design Characteristics .....	2-30
2.5.6 Sustainability.....	2-32
2.5.7 Open Space .....	2-32
2.5.8 Utilities and Infrastructure.....	2-33
2.5.9 Access, Circulation, and Parking .....	2-36
2.5.10 Proposed Facilities Development .....	2-38
2.6 Intended Uses of the EIR and Required Approvals .....	2-41
3 Environmental Setting.....	3-1
3.1 Regional Setting.....	3-1
3.2 Project Site Setting .....	3-1

4	Environmental Impact Analysis.....	4-1
4.1	Aesthetics .....	4-1
4.1.1	Environmental Setting.....	4.1-1
4.1.2	Regulatory Setting.....	4.1-13
4.1.3	Impact Analysis .....	4.1-18
4.2	Air Quality.....	4.2-1
4.2.1	Environmental Setting.....	4.2-1
4.2.2	Regulatory Setting.....	4.2-5
4.2.3	Impact Analysis .....	4.2-8
4.3	Cultural and Historical Resources.....	4.3-1
4.3.1	Environmental Setting.....	4.3-1
4.3.2	Regulatory Setting.....	4.3-34
4.3.3	Impact Analysis .....	4.3-42
4.4	Energy.....	4.4-1
4.4.1	Environmental Setting.....	4.4-1
4.4.2	Regulatory Setting.....	4.4-5
4.4.3	Impact Analysis .....	4.4-12
4.5	Greenhouse Gas Emissions .....	4.5-1
4.5.1	Environmental Setting.....	4.5-1
4.5.2	Regulatory Setting .....	4.5-6
4.5.3	Impact Analysis.....	4.5-13
4.6	Geology and Soils .....	4.6-1
4.6.1	Environmental Setting.....	4.6-1
4.6.2	Regulatory Setting.....	4.6-7
4.6.3	Impact Analysis .....	4.6-9
4.7	Noise.....	4.7-1
4.7.1	Environmental Setting.....	4.7-1
4.7.2	Regulatory Setting.....	4.7-6
4.7.3	Impact Analysis .....	4.7-12
4.8	Population and Housing .....	4.8-1
4.8.1	Environmental Setting.....	4.8-1
4.8.2	Regulatory Setting.....	4.8-7
4.8.3	Impact Analysis .....	4.8-10
4.9	Public Services .....	4.9-1
4.9.1	Environmental Setting.....	4.9-1
4.9.2	Regulatory Setting.....	4.9-7
4.9.3	Impact Analysis .....	4.9-11
4.10	Recreation .....	4.10-1
4.10.1	Environmental Setting.....	4.10-1
4.10.2	Regulatory Setting.....	4.10-4
4.10.3	Impact Analysis .....	4.10-7
4.11	Transportation.....	4.11-1
4.11.1	Environmental Setting.....	4.11-1
4.11.2	Regulatory Setting.....	4.11-9
4.11.3	Impact Analysis .....	4.11-12
4.12	Utilities and Service Systems.....	4.12-1
4.12.1	Environmental Setting.....	4.12-1
4.12.2	Regulatory Setting.....	4.12-4

4.12.3	Impact Analysis .....	4.12-8
4.13	Effects Found Not to be Significant .....	4.13-1
4.13.1	Agriculture and Forestry Resources .....	4.13-1
4.13.2	Biological Resources.....	4.13-2
4.13.3	Geology and Soils .....	4.13-4
4.13.4	Hazards and Hazardous Materials .....	4.13-4
4.13.5	Hydrology and Water Quality .....	4.13-6
4.13.6	Land Use and Planning.....	4.13-10
4.13-7	Mineral Resources.....	4.13-11
4.13-8	Noise .....	4.13-12
4.13-9	Wildfire.....	4.13-12
5	Cumulative Impacts.....	5-1
5.1	Introduction to the Cumulative Analysis.....	5-1
5.2	Cumulative Setting .....	5-2
5.2.1	Geographic Scope .....	5-2
5.3	Analysis of Cumulative Impacts.....	5-6
5.3.1	Aesthetics Effects .....	5-6
5.3.2	Air Quality Effects.....	5-6
5.3.3	Cultural Resources Effects.....	5-7
5.3.4	Energy Effects.....	5-8
5.3.5	Geology and Soils Effects .....	5-9
5.3.6	Greenhouse Gas Effects .....	5-9
5.3.7	Noise Effects.....	5-10
5.3.8	Population and Housing Effects .....	5-11
5.3.9	Public Services Effects .....	5-11
5.3.10	Recreation Effects .....	5-12
5.3.11	Transportation Effects.....	5-12
5.3.12	Utility and Service Systems Effects .....	5-13
6	Other CEQA Required Discussions .....	6-1
6.1	Growth Inducement .....	6-1
6.1.1	Population Growth.....	6-1
6.1.2	Economic Growth.....	6-2
6.1.3	Removal of Obstacles to Growth .....	6-2
6.2	Significant and Unavoidable Adverse Impacts .....	6-3
6.3	Significant and Irreversible Environmental Changes.....	6-3
7	Alternatives .....	7-1
7.1	Introduction.....	7-1
7.2	Consideration of Selection of Alternatives.....	7-2
7.2.1	Attainment of Project Objectives.....	7-2
7.2.2	Summary of Campus Master Plan Impacts .....	7-3
7.3	Alternatives Considered but Not Evaluated Further .....	7-3
7.4	Alternatives Selected for Detailed Analysis.....	7-4
7.4.1	Alternative 1: No Project Alternative.....	7-5
7.4.2	Alternative 2: Reduced Enrollment and Academic Space.....	7-9
7.4.3	Alternative 3: Increased Student Housing .....	7-13
7.5	Comparison of Alternatives.....	7-17

7.6 Environmentally Superior Alternative..... 7-18

8 References..... 8-1

# Preface to the Final EIR

---

In compliance with California Environmental Quality Act (CEQA) Guidelines Section 15132, this document serves as the Final Environmental Impact Report (EIR) for the California State University, Fullerton (CSUF) Campus Master Plan (State Clearinghouse [SCH] No. 2019080575). This Final EIR has been prepared under the direction of the California State University (CSU) Board of Trustees (Trustees), acting as lead agency, in accordance with the requirements of CEQA (Public Resources Code [PRC] Section 21000 et seq.) and the CEQA Guidelines (California Code of Regulations, Title 14, Chapter 3, Section 15000, et seq.). In accordance with Sections 15087 and 15105 of the CEQA Guidelines, the Draft EIR was circulated for public review and comment for a period of 45 days, starting on May 6, 2020 and ending on June 19, 2020.

CEQA Guidelines Section 15132 requires that the Final EIR consist of the following components:

1. The Draft EIR including clarifications and revisions;
2. Comments and recommendations received on the Draft EIR, either verbatim or in summary;
3. A list of persons, organization, and public agencies commenting on the Draft EIR;
4. Lead agency to significant environmental issues raised during public review; and
5. Any other information added by the lead agency which does not constitute significant new information per 15088.5(a) of the CEQA Guidelines.

This Final EIR contains the public comments received on the Draft EIR for the Campus Master Plan, as well as all written responses to those comments. A list of the person, organizations, and public agencies who commented on the Draft EIR is provided in the “Responses to Comments” section of this document. In addition, this document also contains revisions to the Draft EIR with additions shown in double underline and deletions shown in ~~strikethrough~~.

## Introduction

This preface serves as an introduction to the Final EIR and provides an overall summary of the public review process. It provides an overview of the Final EIR contents and a summary of the changes made to the Draft EIR text in response to comments and community input received during the public comment period.

## Public Review Process

The Trustees, acting as the lead agency, prepared the EIR to inform decisionmakers and the public of the potential significant environmental effects associated with the proposed Campus Master Plan. The Draft EIR was circulated for public review and comment for 45 days, from May 6, 2020, through June 19, 2020. A Public Notice of Availability of the Draft EIR was published in a newspaper of general circulation and mailed to all organizations and individuals previously requesting notice. CSUF provided copies of the complete Draft EIR to the State Clearinghouse, which, in turn, distributed the Draft EIR to all interested state agencies for review and comment. The Draft EIR was made available for public review online at: [https://masterplan.fullerton.edu/files/Draft\\_EIR.pdf](https://masterplan.fullerton.edu/files/Draft_EIR.pdf)

Due to the Covid-19 crisis, local public libraries were not accessible to the public for review of hard copies of the Draft EIR. Consequently, a limited number of flash drives containing the Draft EIR and

hardcopies of Volume I of the Draft EIR were made available for mailing to interested members of the public who were unable to access the Draft EIR online. Interested persons and organizations had the opportunity to submit written comments on the Draft EIR during the public review period. Comment letters received on the Draft EIR, reproduced verbatim, and responses to those comments are provided in the “Responses to Comments” section following this preface.

Section 15088(c) of the CEQA Guidelines specifies that the focus of the responses to comments shall be on the disposition of significant environmental issues. Responses are not required for comments regarding the merits of the Campus Master Plan or on issues not related to potential physical environmental impacts and/or the Draft EIRs analysis of such impacts. Comments on the merits of the Campus Master Plan or other comments that do not raise environmental issues are nevertheless included within the record for consideration by the decisionmakers as part of the Campus Master Plan approval process. The responses address environmental issues and indicate where issues raised do not pertain to environmental impacts, analysis, or address the merits of the project. In the latter instance, the comment is acknowledged, and no further response is provided.

Although some of the comments have resulted in changes to the text of the Draft EIR, none of the changes constitute “significant new information,” which would require its recirculation. “Significant new information” is defined in Section 15088.5(a) of the CEQA Guidelines as follows:

1. A new significant environmental impact would result from the project or from a new mitigation measure proposed to be implemented.
2. A substantial increase in the severity of an environmental impact would result unless mitigation measures are adopted that reduce the impact to a level of insignificance.
3. A feasible project alternative or mitigation measure considerably different from others previously analyzed would clearly lessen the environmental impacts of the project, but the project’s proponents decline to adopt it.
4. The Draft EIR was so fundamentally and basically inadequate and conclusory in nature that meaningful public review and comment were precluded.

None of these circumstances has arisen from comments on the Draft EIR; therefore, recirculation is not required. As required by CEQA Section 21092.5 and CEQA Guidelines Section 15088(b), at least 10 days before consideration of the Final EIR for certification, CSUF has provided written responses (via electronic files) to each individual commenter, organization, and public agency that submitted written comments on the Draft EIR.

## Overview of Final EIR

The Final EIR consists of the following components, in the following order:

1. List of persons, organizations, and public agencies commenting on the Draft EIR;
2. Comments from and Responses to persons, organizations, and public agencies; and
3. The Draft EIR (May 2020) including technical appendices, with text and figure clarifications, corrections, and additions shown in underline and deletions shown in strikethrough.

## Revisions to the Draft EIR

The following list summarizes the changes made to the Draft EIR since public review. These changes are reflected with additions shown in underline and deletions shown in strikethrough. Where supporting

technical appendices that supplement these revisions have also been revised, those are also noted below.

## Executive Summary

- Mitigation Measure AQ-1 has been moved to Impact AQ-2 to match the Impact Analysis discussion in Section 4.2, *Air Quality*.
- Thresholds from Section 4.9, *Public Services*, have been relabeled as PS-1a through PS-1d rather than PUB-1a through PUB-1d.
- Impact REC-1 was expanded to match the Impact Analysis discussion in Section 4.10, *Recreation*.
- Thresholds from Section 4.11, *Transportation*, have been relabeled as T-1 through T-4 rather than TRAN-1 through TRAN-4.
- Thresholds from Section 4.12, *Utilities and Service Systems*, have been relabeled as U-1 through U-7b rather than UTIL-1 through UTIL-5. The thresholds were edited to match the Impact Analysis discussion in Section 4.12.

## Section 2, "Project Description"

- Clarification of the number of student beds proposed as part of the Campus Master Plan have been made. The following footnote has been added to pages 2-23 and 2-24, "Approximately 600 of the proposed 3,000 student housing beds were proposed and evaluated under the 2003 Master Plan and are the subject of separate environmental review. These beds are included in this discussion as they have not yet been constructed and are a part of the projected 3,000 additional student beds accommodated under the Campus Master Plan."
- Figure 2-27 has been revised to accurately reflect the campus' location west of State Route (SR) 57, called out as "57 Freeway."
- Page 2-30 of Section 2.5.3, *Residential and Student Life Facilities*, is revised as follows:  
 The Campus Master Plan proposes an additional 803,880 gsf of on-campus student housing (approximately 3,000 beds) and an additional 539,000 gsf (approximately 350 beds) of on-campus faculty/staff housing. Of the 3,000 student beds, 600 are part of a separate project subject to separate environmental review, not included in the Campus Master Plan and are not analyzed in this EIR. These beds are included in this discussion as they have not yet been constructed and are a part of the projected 3,000 additional student beds accommodated under the Campus Master Plan. Student housing would be built in three clusters; two clusters would be built next to the existing residence halls located on the west side of campus, and one cluster would be constructed on the western side of the campus to increase student activity in this area. The faculty/staff housing complex would be located south of Nutwood Avenue by the existing College Park building.

## Section 4.2, "Air Quality"

- Clarification of the number of student beds proposed as part of the Campus Master Plan have been made. The following footnote has been added to page 4.2-13, "Approximately 600 of the proposed 3,000 student housing beds were proposed evaluated under the 2003 Master Plan and are the subject of separate environmental review. These beds are included in this discussion as they have not yet been constructed and are a part of the projected 3,000 additional student beds accommodated under the Campus Master Plan."

## Section 4.5, “Greenhouse Gas Emissions”

- Cumulative analysis has been deleted from pages 4.5-20 and -21. The deleted text was a duplication of the information included in Section 5, *Cumulative Impacts*.

## Section 4.8, “Population and Housing”

- Page 4.8-7 is revised to refer to the CSU requirement for a Campus Master Plan. The word “physical” is replaced with the word “campus.”
- Page 4-11 is revised to indicate that 600 of the proposed 3,000 student housing beds were proposed and evaluated under the 2003 Master Plan. These 600 units have not yet been approved.
- Page 4-11 is revised as follows:

Table 4.8-6 shows the approximate number of current and proposed on-campus and off-campus residences. The Campus Master Plan would result in an increase of approximately 3,350 student and faculty residents on-campus and an expected 4,650 students and faculty that would reside off-campus by the Campus Master Plan horizon year.
- Table 4.8-6, *CSUF Student and Faculty/Staff Housing*, on page 4.8-12 is revised to correctly refer to a 2039 campus population of 5,000 students and 5,356 total on-campus residents. In addition, the footnotes for this table are revised as follows:

The Campus Master Plan would add approximately 7,000 total FTES by 2039: ~~2,400~~3,000 on-campus student residents and ~~4,600~~4,000 off-campus student residents.

Approximately 600 of the proposed 3,000 student housing units beds ~~have already been approved and impacts~~ were evaluated under the 2003 Master Plan and are the subject of separate environmental review. These units beds are included in this analysis table as they have not yet been constructed and are a part of the projected 3,000 additional student beds accommodated under the Campus Master Plan.
- Reference to the 600 student beds evaluated under the 2003 Master Plan is removed from the text on page 4.8-12.
- Impact PH-2 on page 4.8-13 is revised to remove the statement that the 600 student beds evaluated under the 2003 Master Plan have been approved.

## Section 4.10, “Recreation:

- Figure 4.10-1 has been revised to accurately reflect the campus’ location west of SR 57, called out as “57 Freeway”.

## Section 4.11, “Transportation”

- Route 24 has been changed to Route 123 on page 4.11-4. A brief discussion was added regarding changes to OCTA bus routes including the emergence of Route 123 in place of Route 24.
- The Final EIR is revised as follows:
  - **SR 57**, also known as the Orange Freeway, provides north-south regional access between Orange and Los Angeles Counties with five travel lanes and one carpool lane in each direction. SR 57 provides access to the Project via the Yorba Linda Boulevard and Nutwood Avenue interchanges.
- Appendix M, *Traffic Impact Analysis*, is revised as follows to further detail the analysis:

Existing and proposed bicycle and pedestrian facilities in the project vicinity are described below based on field observations, and the *Fullerton Bicycle Master Plan (2012)*, and the *Fullerton Bike Connection Plan (2017)*:

- Existing Class II bike facilities provide connections to the campus area on Associated Road, Dorothy Lane, and Commonwealth Avenue.
  - Nutwood Avenue does not have existing bicycle facilities. The Fullerton Bicycle Master Plan includes planned Class III facilities are planned on Nutwood Avenue Yorba Linda Boulevard from North State College Boulevard to Placentia Avenue. The Fullerton Bike Connection Plan includes Class II bike lanes on Nutwood Avenue between North State College Boulevard and Placentia Avenue, with buffers accompanying the bike lanes intermittently as the cross section allows.
  - Yorba Linda Boulevard does not have existing bicycle facilities. The Fullerton Bicycle Master Plan includes planned Class III facilities are planned on Yorba Linda Boulevard from North State College Boulevard to Associated Road. The Fullerton Bike Connection Plan includes Class II bike lanes on both sides of Yorba Linda Boulevard between SR 57 NB ramps and SR 57 SB ramps, and a Class II bike lane on eastbound Yorba Linda Boulevard and a Class III facility on westbound Yorba Linda Boulevard between Campus Drive and Oxford Drive.
- Attachment M, “Traffic Impact Study,” has been edited on page 2 to change the following roadway descriptions:
  - Associated Road is currently built as a four-lane, divided roadway north of Yorba Linda Boulevard.
  - Bastanchury Road is built as a four- to five-lane, divided roadway between State College Blvd and State Route 57.
  - Bradford Avenue is classified as a secondary arterial. Additionally, Bradford Avenue is built as a two-lane, undivided to a four-lane, undivided roadway.
  - Chapman Avenue is built as a five-lane, divided roadway between State College and Placentia Avenue.
  - Commonwealth Avenue between Nutwood Avenue and Chapman Avenue is classified as a major arterial in the City’s General Plan and a primary arterial in the City of Fullerton’s Master Plan of Arterial Highways (MPAH). Commonwealth Avenue south of Chapman Avenue is classified as a primary arterial in both the City’s General Plan and the MPAH. Additionally, Commonwealth Avenue between State College and Chapman Avenue is built as a two-lane divided roadway with bike lanes.
  - Nutwood Avenue between Placentia Avenue to Commonwealth Avenue is built as a four- to five-lane divided roadway.

## Section 5, “Cumulative Impacts”

- Text has been moved from the duplicative Cumulative Impacts discussion contained in Section 4.5, *Greenhouse Gas Emissions*, to page 5-9 of Section 5, *Cumulative Impacts*.

## Section 7, “Alternatives”

- Page 7-5 has been revised to correctly refer to the 24/7 active campus environment.
- Page 7-9 of Section 7.4.2, *Alternative 2: Reduced Enrollment and Academic Space*, has been revised as follows to clarify the features of Alternative 2:

Under the Reduced Enrollment and Academic Space Alternative, most aspects of the Campus Master Plan would still be implemented. The buildings proposed for renovation, such as McCarthy Hall, Langsdorf Hall, the Pollak Library, the Visual Arts complex, and the Humanities Social Sciences building, would still be renovated as under the Campus Master Plan. The new event center, mobility hubs, parking structures, new innovation center, proposed Arboretum improvements, and the four new student/faculty housing clusters would be implemented as proposed under the Campus Master Plan. However, academic space would be reduced, since academic space entitlement is driven by FTES enrollment, the FTES growth goal of 32,000 would also be reduced, as would and associated demand for student support space would also be reduced. Under this alternative, buildings A1 and A5 would not be constructed, which would reduce academic and student support space. The removal of these two buildings equates to the removal of 235,000 sf of academic space and 130,000 sf of student life space, for a total reduction of 365,000 sf, compared to the Campus Master Plan.

- Page 7-11 of Section 7.4.2, *Alternative 2: Reduced Enrollment and Academic Space*, is revised as follows:

### Recreation

The Campus Master Plan was determined not to result in a significant increase in the use of neighborhood and regional parks or other recreational facilities, nor would it include or require the construction of such facilities, potentially causing significant environmental impacts in their own right, would be required to ensure the continued adequate provision of such services. As the Reduced Enrollment and Academic Space Alternative represents a reduction in student enrollment and a reduced need for academic space, impacts to on-campus facilities, including the Arboretum, and off-campus ~~on~~ parks and recreational facilities would likewise be less than significant and would be reduced compared to the Campus Master Plan. (*Less impact*)

- Page 7-13 has been revised to accurately reflect the presence of SR 57 to the east of campus.
- Page 7-15 of Section 7.4.3, *Alternative 3: Increased Student Housing*, has been revised to correct a capitalization typo in the Public Services discussion. In addition, the Recreation discussion has been edited to refer to less than significant impacts to off-campus parks and recreational facilities.
- Clarification of the number of student beds proposed as part of the Campus Master Plan have been made. The following footnote has been added to page 7-16, "Approximately 600 of the proposed 3,000 student housing beds were evaluated under the 2003 Master Plan and are the subject of separate environmental review. These beds are included in this discussion as they have not yet been constructed and are a part of the projected 3,000 additional student beds accommodated under the Campus Master Plan."
- Page 7-17 has been revised to accurately refer to the Increased Student Housing Alternative.
- Impacts to the Recreation issue area have been added to Table 7-1, *Impact Comparison of Alternatives*, on page 7-18.
- Page 7-19 of Section 7.6, *Environmentally Superior Alternative*, is revised as follows:  
When considering objectives, the Campus Master Plan would best meet the purpose and need. In contrast, Alternative 1 would not provide additional housing to accommodate any growth in student enrollment. Alternative 2 would generally result in impacts that are less or equal to the Campus Master Plan but would not provide all of the additional academic facilities to meet the needs that would be generated by planned student population growth. Alternative 3 would reduce some impacts but because additional student housing would be provided, impacts to ~~transportation~~

aesthetics, air quality, cultural resources, energy, GHG, noise and utilities and service systems would be greater.

## Section 8, “References”

- The *Fullerton Arboretum Strategic Plan* (2005) has been added to page 8-13.

## Project Decision Process

This Final EIR will be considered by the Trustees prior to a decision on whether to approve the Campus Master Plan. If the Trustees decide to approve the project, the Trustees, as required by CEQA Guidelines Section 15090, must first certify that the EIR was completed in compliance with CEQA’s requirements, was reviewed and considered by the Trustees, and reflects its independent judgment and analysis. The Trustees are then required to adopt findings of fact on the disposition of each significant environmental impact, as required by CEQA Guidelines Section 15091. If significant and unavoidable impacts (those that cannot feasibly be mitigated to less than significant levels) would result from implementing the Campus Master Plan, the project can still be approved, but the Trustees must issue a “statement of overriding considerations” explaining in writing the specific economic, social, or other considerations that it believes, based on substantial evidence, make those significant effects acceptable (PRC Section 21002; CEQA Guidelines Section 15093). A mitigation monitoring and reporting program, which is required by CEQA Guidelines Section 15091(d), would be considered and adopted by the Trustees in conjunction with project approval.

*This page intentionally left blank.*

# Comments and Responses on the Draft EIR

---

This section includes comments received during public circulation of the Draft Environmental Impact Report (EIR) prepared for the CSUF Campus Master Plan Update (Campus Master Plan). In conformance with Section 15088(a) of the California Environmental Quality Act (CEQA) Guidelines, written responses were prepared to address comments on significant environmental issues received from reviewers of the Draft EIR

The Draft EIR was circulated for a 45-day public review period that began on May 6, 2020 and ended on June 19, 2020. CSUF received eight comment letters on the Draft EIR, one of which was submitted after the close of the public comment period. Responses to all comments have been included in this section. The commenters and the page number on which each commenter’s letter appear are listed below.

Letter No. and Commenter	Date Received	Page No.
<b>State Agencies</b>		
S1      Scott Shelley, California Department of Transportation	June 19, 2020	2
<b>Local Agencies</b>		
L1      Fran Colwell, President, Friends of the Fullerton Arboretum	June 12, 2020	13
L2      Bob Linnell, Fullerton Heritage	June 18, 2020	32
L3      Andrew Gonzales, City of Placentia	June 19, 2020	34
L4      Dan Phu, Orange County Transportation Authority	June 19, 2020	37
<b>Individuals</b>		
I1      Bill Sampson	May 6, 2020	44
I2      Gregory Dymont, CSUF Employee	June 1, 2020	46
I3      Kevin Yaldezian	June 19, 2020*	48

\* Comment was received at 9:56 p.m., after the close of the public comment period (5:00 p.m.). However, responses to these comments have been included in this section.

The comment letters and responses follow. The comment letters have been numbered sequentially and each separate issue raised by the commenter, if more than one, has been assigned a number. The responses to each comment identify first the number of the comment letter, and then the number assigned to each issue (Response S1.1, for example, indicates that the response is for the first issue raised in comment Letter S1.1).

Making Conservation  
a California Way of Life.

June 19, 2020

Emil Zordilla  
California State University, Fullerton  
800 North State College Blvd.  
Fullerton, CA 92831

File: IGR/CEQA  
SCH: 2019080575  
12-ORA-2019-01370  
SR 57; PM 17.941

Dear Mr. Zordilla

Thank you for including the California Department of Transportation (Caltrans) in the review of the Draft Environmental Impact Report (EIR) for the proposed Updated Campus Master Plan for California State University, Fullerton (CSUF). The mission of Caltrans is to provide a safe, sustainable, integrated and efficient transportation system to enhance California's economy and livability.

The project proposes an update to the Campus Master Plan components which includes: net new on-campus housing for up to 3,000 students, a 6,000-seat event center, recreational facility and student union upgrades, new facilities and programs to enhance the University's Fullerton Arboretum, reconfigured and potentially increased parking capacity, new transit mobility hubs, and the College Park pedestrian bridge access across Nutwood Avenue. The Campus Master Plan will accommodate up to 32,000 full-time equivalent students (FTES) through the year 2040, an increase from the previously approved enrollment level of 25,000 as of the 2016/2017 academic year. The proposed Campus Master Plan includes new net additions/enhancements of approximately 5,044,111 gross square feet (gsf) of on-campus facilities.

The project site encompasses the main CSUF campus, generally bordered by State Route 57 (SR-57) on the east, North State College Boulevard on the west, Yorba Linda Boulevard on the north, and Nutwood Avenue on the south, as well as the University's College Park classroom building and parking facilities south of Nutwood Avenue, bordered by College Place on the south, Langsdorf Drive on the east, and North Commonwealth Avenue on the west. SR 57 is owned and operated by Caltrans. Caltrans is a responsible/commenting agency and has the following comments:

S1.1

**Traffic Operations**

- |   |      |
|---|------|
| 1. The proposed project includes increases of 4,000 commuter students, 3,000 on-campus residents, and 1,000 employees. The Transportation Impact Study (TIS) states that daily traffic volumes will increase along Yorba Linda Blvd, Nutwood Ave, and Chapman Ave. Specifically, the section on Nutwood Ave between State College Blvd and SR 57 sees an increase by as much as 17%, with Existing Plus Project. The roadways traversing SR 57 currently experience conditions that queue traffic along the off-ramps and onto the mainline. The request to analyze additional queuing/spillback onto SR 57 and mainline merging/diverging from our comment letter (dated: October 3, 2019) during the NOP public comment period has not been addressed sufficiently in this DEIR. Please provide the requested analysis for our review.  | S1.2 |
| 2. Please include Daily Traffic Volumes (for all analysis scenarios presented in the TIS) for SR 57 within the Project vicinity (from north of Yorba Linda Blvd to south of Chapman Ave).   | S1.3 |
| 3. Caltrans Headquarters has identified locations with high concentrations of collisions along the mainline of SR 57 and at the interchanges of Yorba Linda Blvd and Nutwood Ave. Documented collisions involved both vehicular and bicycle modes of travel. With the projected increase in vehicular and bicycle traffic for the proposed Campus Master Plan there is expected to be more conflicts between the two modes of travel, resulting in an increased number of collisions and their severity. Therefore, further analysis of bicycle facilities (traversing State Facilities) is requested. The Project proposes a Class III (Bike Route) facility along Yorba Linda Blvd but no proposed bike facilities along either Nutwood Ave or Chapman Ave. Refer to the 2018 City of Fullerton Bicycle Proposal that proposed to add a Class II (Bike Lane) facility along Yorba Linda Blvd and Class I bicycle facility along Nutwood Ave, and consider incorporation of such facilities in the proposed project. | S1.4 |
| 4. Are the proposed traffic generating facilities (i.e. new 6,000 seat Event Center, Innovation Center) included in the project generated daily volume counts? Will the Event Center be used for non-school activities (i.e. concerts, plays, etc.)? This could have impacts on State Facilities and should be discussed/analyzed in the DEIR.  | S1.5 |
| 5. SR 57 Nutwood Ave interchange should be identified as providing access to Project on TIS (Page 2 - Regional Roadways).   | S1.6 |

**Transportation Planning**

- 6. Continue to consider/provide bicycle parking where feasible to facilitate maximum usage of the proposed improvements. Additionally, Caltrans supports Complete Streets features such as green bike lanes and striping, as well as continental crosswalks. Please continue to coordinate with Caltrans to develop multimodal facilities.

S1.7

**Transit**

- 7. Please include discussion of the planned new Metrolink train station in the City of Placentia, to be located at Melrose Avenue and Crowther Avenue, southeast of the campus. This station will serve the Metrolink 91 Line that extends to Riverside, Fullerton and Los Angeles and will include expanded bus service in the area to increase mobility and provide connections to local destinations. Coordinate with OCTA for opportunities to increase regional mobility options and to provide connections by enhancing the bus service once the station opens for service.

S1.8

**Freight**

- 8. Please consider incorporating/enhancing designated areas/parking for freight delivery, package and transportation network companies pick up and drop off into the Campus Master Plan.

S1.9

**Advanced Planning**

- 9. Please coordinate with Caltrans Project Manager (Simin Arazbegi) for projects that may impact this proposed improvement. In addition, please coordinate with Caltrans Project Manager Farid Nowshiravan, specifically, regarding the Integrated Corridor Management Project along SR 57.

S1.10

**Permits:**

- 10. Any project work proposed in the vicinity of the State right of way will require an encroachment permit, and all environmental concerns must be adequately addressed. Please coordinate with Caltrans in order to meet the requirements for any work within or near State Right-of-Way. A fee may apply. If the cost of work within the State right of way is below one Million

S1.11

Dollars, the Encroachment Permit process will be handled by our Permits Branch; otherwise the permit should be authorized through the Caltrans's Project Development Department. When applying for Encroachment Permit, please incorporate all Environmental Documentation, SWPPP/ WPCP, NPDES, Hydraulic Calculations, R/W certification and all relevant design details including design exception approvals. For specific details for Encroachment Permits procedure, please refer to the Caltrans's Encroachment Permits Manual. The latest edition of the Manual is available on the web site: <http://www.dot.ca.gov/hq/traffops/developserv/permits/>

S1.11  
(cont.)

Please continue to coordinate with Caltrans for any future developments that could potentially impact State transportation facilities. If you have any questions, please do not hesitate to contact Julie Lugaro at [Julie.lugaro@dot.ca.gov](mailto:Julie.lugaro@dot.ca.gov).

S1.12

Sincerely,

SCOTT SHELLEY  
Branch Chief, Regional-IGR-Transit Planning  
District 12

## Letter S1

**COMMENTER:** Scott Shelley, Branch Chief, Regional-IGR-Transit Planning, District 12, California Department of Transportation (Caltrans)

**DATE:** June 19, 2020

### Comment S1.1

The project site encompasses the main CSUF campus, generally bordered by State Route 57 (SR-57) on the east, North State College Boulevard on the west, Yorba Linda Boulevard on the north, and Nutwood Avenue on the south, as well as the University's College Park classroom building and parking facilities south of Nutwood Avenue, bordered by College Place on the south, Langsdorf Drive on the east, and North Commonwealth Avenue on the west. SR 57 is owned and operated by Caltrans.

### Response S1.1

The comment summarizes the location of the CSUF campus and establishes that Caltrans is a responsible/commenting agency.

The comment does not raise any environmental issues related to the adequacy of the EIR analysis, and no further response is required. The comment is included within the record for consideration by the decision makers as part of the Campus Master Plan approval process.

### Comment S1.2

The proposed project includes increases of 4,000 commuter students, 3,000 on-campus residents, and 1,000 employees. The Transportation Impact Study (TIS) states that daily traffic volumes will increase along Yorba Linda Blvd, Nutwood Ave, and Chapman Ave. Specifically, the section on Nutwood Ave between State College Blvd and SR 57 sees an increase by as much as 17%, with Existing Plus Project. The roadways traversing SR 57 currently experience conditions that queue traffic along the off-ramps and onto the mainline. The request to analyze additional queuing/spillback onto SR 57 and mainline merging/diverging from our comment letter (dated: October 3, 2019) during the NOP public comment period has not been addressed sufficiently in this DEIR. Please provide the requested analysis for our review.

### Response S1.2

The comment states that Caltrans requested an analysis of the Campus Master Plan impacts on queuing/spillback onto State Route (SR) 57 and mainline merging/diverging in a comment letter submitted during the NOP public comment period (dated October 3, 2019).

The Colletown Specific Plan Draft EIR was completed in 2014 and is the most recent study of traffic operations in the project vicinity. This study showed acceptable operations at the SR 57 and Yorba Linda Boulevard ramps and SR 57 and Nutwood Avenue ramps in the existing and cumulative (2030) conditions.

The *Caltrans Draft VMT-Focused Transportation Impact Study Guide* (Draft TISG) issued February 28, 2020 states that:

“A key change for the LD-IGR program is that CEQA documents will now consider different types of transportation impacts than previously examined. When analyzing the impact of VMT on the State Highway System resulting from local land use projects, the focus will no longer be on traffic at intersections and roadways immediately around project sites. Instead, the focus will be on how projects are likely to influence the overall amount of automobile use. SB 743 specifies that “...automobile delay, as described solely by level of service or similar measures of vehicular capacity or traffic congestion, shall not be considered a significant impact on the environment” (California Public Resources Code Section 21099).”

As this comment does not pertain to the VMT analysis or impacts of the project, the comment does not raise any environmental issues related to the adequacy of the EIR analysis, and no further response is required. The comment is included within the record for consideration by the decision makers as part of the Campus Master Plan approval process.

### **Comment S1.3**

Please include Daily Traffic Volumes (for all analysis scenarios presented in the TIS) for SR 57 within the project vicinity (from north of Yorba Linda Blvd to south of Chapman Ave).

### **Response S1.3**

The comment requests the inclusion of Daily Traffic Volumes for all analysis scenarios presented in the Traffic Impact Study (TIS) for SR 57 within the Project Vicinity (from north of Yorba Linda Boulevard to south of Chapman Avenue).

2017 traffic data from the Caltrans Traffic Census Program shows that average daily traffic volumes for SR 57 between Nutwood Avenue and Yorba Linda Boulevard are between 245,000 and 256,500. Daily traffic volumes for the baseline and future year conditions were not required to complete the VMT analysis to determine significant transportation impacts and were not prepared as part of this study.

The comment does not raise any environmental issues related to the adequacy of the EIR analysis, and no further response is required. The comment is included within the record for consideration by the decision makers as part of the Campus Master Plan approval process.

### **Comment S1.4**

Caltrans Headquarters has identified locations with high concentrations of collisions along the mainline of SR 57 and at the interchanges of Yorba Linda Blvd and Nutwood Ave. Documented collisions involved both vehicular and bicycle modes of travel. With the projected increase in vehicular and bicycle traffic for the proposed Campus Master Plan there is expected to be more conflicts between the two modes of travel, resulting in an increased number of collisions and their severity. Therefore, further analysis of bicycle facilities (traversing State Facilities) is requested. The Project proposes a Class III (Bike Route) facility along Yorba Linda Blvd but no proposed bike facilities along either Nutwood Ave or Chapman Ave. Refer to the 2018 City of Fullerton Bicycle Proposal that proposed to add a Class II (Bike Lane) facility along Yorba Linda Blvd and Class I bicycle facility along Nutwood Ave, and consider incorporation of such facilities in the proposed project.

## Response S1.4

The comment expresses concern about the potential for increased bicycle and pedestrian collisions as the result of Campus Master Plan implementation and refers to a 2018 City of Fullerton Bicycle Proposal. It should be noted that the commenter intended to refer to the 2017 *Fullerton Bike Connection Plan*.

Evaluation of bicycle facilities traversing State Facilities was completed as part of the referenced Fullerton Bike Connection Plan and reviewed and considered as part of the Campus Master Plan process. This Plan proposes the following bicycle facilities on Yorba Linda Boulevard and Nutwood Avenue:

- Class II bike lane on both sides of Yorba Linda Boulevard between SR 57 NB ramps and SR 57 SB ramps
- Class II bike lane on eastbound Yorba Linda Boulevard and a Class II facility on westbound Yorba Linda Boulevard between Campus Drive and Oxford Drive
- 2-way bicycle path on CSUF property along the northern block face of Nutwood Avenue with continuation east as a Class II facility to Placentia Avenue.

Page 4.11-7 of Section 4.11, *Transportation*, and Appendix M, *Traffic Impact Analysis*, is revised as follows to provide additional detail about existing conditions:

Existing and proposed bicycle and pedestrian facilities in the campus vicinity are described below based on field observations and the *Fullerton Bicycle Master Plan (2012)* and the *Fullerton Bike Connection Plan (2017)*:

- Existing Class II bike facilities provide connections to the campus area on Associated Road, Dorothy Lane, and Commonwealth Avenue.
- Nutwood Avenue does not have existing bicycle facilities. The Fullerton Bicycle Master Plan includes planned Class III facilities are planned on Nutwood Avenue Yorba Linda Boulevard from North State College Boulevard to Placentia Avenue. The Fullerton Bike Connection Plan includes Class II bike lanes on Nutwood Avenue between North State College Boulevard and Placentia Avenue, with buffers accompanying the bike lanes intermittently as the cross section allows.
- Yorba Linda Boulevard does not have existing bicycle facilities. The Fullerton Bicycle Master Plan includes planned Class III facilities are planned on Yorba Linda Boulevard from State College Boulevard to Associated Road. The Fullerton Bike Connection Plan includes Class II bike lanes on both sides of Yorba Linda Boulevard between SR 57 NB ramps and SR 57 SB ramps, and a Class II bike lane on eastbound Yorba Linda Boulevard and a Class III facility on westbound Yorba Linda Boulevard between Campus Drive and Oxford Drive.
- State College Boulevard does not have existing bicycle facilities and they are not proposed in the future.
- A new bicycle overcrossing is proposed on SR 57; it would provide a Class I path and would connect the campus to Placentia Avenue.

The Campus Master Plan does propose a two-way bicycle path on the CSUF property along the westbound side of Nutwood Avenue with continuation east as a Class II facility to Placentia Avenue. Figure 75 in the Campus Master Plan indicates, "Pedestrian and Bicycle Improvements across SR 57" on both Yorba Linda Blvd and Nutwood Avenue, and nothing in the Campus Master Plan would

interfere with the implementation of these facilities. The comment does not raise any environmental issues related to the adequacy of the EIR analysis.

### Comment S1.5

Are the proposed traffic generating facilities (i.e., new 6,000 seat Event Center, Innovation Center) included in the project generated daily volume counts? Will the Event Center be used for non-school activities (i.e. concerts, plays, etc.)? This could have impacts on State Facilities and should be discussed/analyzed in the DEIR.

### Response S1.5

The comment asks if proposed traffic-generating facilities were included in the project generated daily volume counts, and requests additional discussion concerning proposed facilities that can be used for non-CSUF activities.

As stated on page 2-25 of Section 2, *Project Description*, the Event Center and Innovation Center could be used for special events by CSUF or by outside groups. On a typical day, these uses would not generate trips or VMT. The VMT analysis presented in the Draft EIR represents a typical campus daily trip generation scenario.

### Comment S1.6

SR 57 Nutwood Ave interchange should be identified as providing access to Project on TIS (page 2 - Regional Roadways).

### Response S1.6

The comment states that on page 2 of the TIS, the SR 57/Nutwood Avenue interchange should be identified as providing access to CSUF.

Page 4.11-1 of Section 4.11, *Transportation*, and Appendix M, *Traffic Impact Analysis*, are revised as follows:

**SR 57**, also known as the Orange Freeway, provides north-south regional access between Orange and Los Angeles Counties with five travel lanes and one carpool lane in each direction. SR 57 provides access to the Project via the Yorba Linda Boulevard and Nutwood Avenue interchanges.

### Comment S1.7

Continue to consider/provide bicycle parking where feasible to facilitate maximum usage of the proposed improvements. Additionally, Caltrans supports Complete Streets features such as green bike lanes and striping, as well as continental crosswalks. Please continue to coordinate with Caltrans to develop multimodal facilities.

### Response S1.7

The comment states that bicycle parking on campus should be maximized, expresses support for Complete Streets features, and requests continued coordination between the university and Caltrans regarding these and other multimodal facilities.

As stated on page 4.11-17 of Section 4.11, *Transportation*, the Campus Master Plan proposes to implement a number of measures to help expand and simplify bicycle and pedestrian access through campus, including improvements to pedestrian and bicycling signage and wayfinding. Recommendations in the Campus Master Plan that are grounded in Complete Streets principals include enhanced pedestrian crossings along Nutwood Avenue and North State College Boulevard, in addition to the pilot medium-term and full long-term closure of portions of Gymnasium Drive on campus to create a pedestrian thoroughfare. Countermeasures described and recommended for specific locations in the Campus Master Plan include curb extensions, leading pedestrian intervals, nose extensions of refuge islands, rectangular rapid flashing beacons, and high-visibility crosswalks.

The comment does not raise any environmental issues related to the adequacy of the EIR analysis, and no further response is required. The comment is included within the record for consideration by the decision makers as part of the Campus Master Plan approval process.

### **Comment S1.8**

Please include discussion of the planned new Metrolink train station in the City of Placentia, to be located at Melrose Avenue and Crowther Avenue, southeast of the campus. This station will serve the Metrolink 91 Line that extends to Riverside, Fullerton and Los Angeles and will include expanded bus service in the area to increase mobility and provide connections to local destinations. Coordinate with OCTA for opportunities to increase regional mobility options and to provide connections by enhancing the bus service once the station opens for service.

### **Response S1.8**

The comment requests discussion of the planned new Metrolink train station in the City of Placentia, as the opening of this station will coincide with expanded bus service in the area to increase mobility and transit connections. The comment further requests that CSUF coordinate with OCTA once the station opens for service.

Future transit service will be provided from the planned Metrolink station at Placentia. However, the existing Fullerton Metrolink station will continue to provide access to the Metrolink 91 and Orange County Lines, as well as several OCTA bus routes. The Fullerton Metrolink station will continue to serve as the primary transit hub for the campus.

The comment does not raise any environmental issues related to the adequacy of the EIR analysis, and no further response is required. The comment is included within the record for consideration by the decision makers as part of the Campus Master Plan approval process.

### **Comment S1.9**

Please consider incorporating/enhancing designated areas/parking for freight delivery, package and transportation network companies pick up and drop off into the Campus Master Plan.

### **Response S1.9**

The comment requests incorporation of designated areas for freight delivery, package and transportation network companies on campus.

Delivery vehicles are currently allowed on the CSUF campus and travel along marked roadways. When stopping to make a delivery, vehicles either park in marked parking spaces, or park along the

side of the roadway, similar to what one would see in an urban environment. There are no changes proposed to this process; proposed circulation is addressed on page 2-34 of Section 2, *Project Description*, of the Draft EIR and in additional detail in Chapter 3 of the Campus Master Plan. The Campus Master Plan does recognize that some internal roadways are narrow, and new, internal streets have been designed to accommodate larger, delivery vehicles, as shown in Figure 46 on page 93 of the Campus Master Plan.

The comment does not raise any environmental issues related to the adequacy of the EIR analysis, and no further response is required. The comment is included within the record for consideration by the decision makers as part of the Campus Master Plan approval process.

### **Comment S1.10**

Please coordinate with Caltrans Project Manager (Simin Arazbegi) for projects that may impact this proposed improvement. In addition, please coordinate with Caltrans Project Manager Farid Nowshiravan, specifically, regarding the Integrated Corridor Management Project along SR 57.

### **Response S1.10**

The comment requests future coordination with Caltrans staff for projects that may affect Caltrans facilities.

The comment does not raise any environmental issues related to the adequacy of the EIR analysis, and no further response is required. The comment is included within the record for consideration by the decision makers as part of the Campus Master Plan approval process.

### **Comment S1.11**

Any project work proposed in the vicinity of the State right of way will require an encroachment permit, and all environmental concerns must be adequately addressed. Please coordinate with Caltrans in order to meet the requirements for any work within or near State Right-of-Way. A fee may apply. If the cost of work within the State right of way is below one Million Dollars, the Encroachment Permit process will be handled by our Permits Branch; otherwise the permit should be authorized through the Caltrans's Project Development Department. When applying for Encroachment Permit, please incorporate all Environmental Documentation, SWPPP/ WPCP, NPDES, Hydraulic Calculations, R/W certification and all relevant design details including design exception approvals. For specific details for Encroachment Permits procedure, please refer to the Caltrans's Encroachment Permits Manual. The latest edition of the Manual is available on the web site: <http://www.dot.ca.gov/hq/traffops/developserv/permits/>.

### **Response S1.11**

The comment states that any project work proposed in the vicinity of the State right-of-way will require an encroachment permit, and all environmental concerns must be adequately addressed. It is acknowledged that CSUF is required to comply with the stated requirements.

The comment does not raise any environmental issues related to the adequacy of the EIR analysis, and no further response is required. The comment is included within the record for consideration by the decision makers as part of the Campus Master Plan approval process.

### **Comment S1.12**

Please continue to coordinate with Caltrans for any future developments that could potentially impact State transportation facilities. If you have any questions, please do not hesitate to contact Julie Lugaro at Julie.lugaro@dot.ca.gov.

### **Response S1.12**

The comment requests future coordination with Caltrans staff.

The comment does not raise any environmental issues related to the adequacy of the EIR analysis, and no further response is required. The comment is included within the record for consideration by the decision makers as part of the Campus Master Plan approval process.

# Letter L1

## The Friends of The Fullerton Arboretum

June 12, 2020

Emil Zordilla  
Director of Planning and Design – Campus Architect  
Capital Programs & Facilities Management  
California State University, Fullerton  
800 N. State College Boulevard  
Fullerton, California 92831

Dear Director Zordilla:

Thank you for the opportunity to review and comment on the California State University, Fullerton (CSUF) Physical Master Plan Draft Environmental Impact Report (EIR). The Friends of the Fullerton Arboretum (Friends) are a 501(c)3 non-profit partner committed to implementing the mission of the Arboretum for the past 45 years. We are supportive of the efforts to improve the campus through this strategic planning process. There is a compelling need for the development of quality facilities and infrastructure to accommodate both current campus use and anticipated future growth while also protecting and improving the botanical, physical and historic resources of the Fullerton Arboretum. This must integrate with enhancement of academic purposes, student success and community use.

L1.1

The Draft EIR has been diligently researched and professionally composed by the University and Rincon Consultants, although the Friends have some concerns about portions of Section 7 as listed below. The accompanying final Physical Master Plan as developed by the University, Flad Architects and the other consultants is great, a significant improvement over earlier drafts. The graphics are of high quality in each document. This is much-needed, state-of-the-art university strategic planning that will provide guidance for decades to come. The Friends are pleased that our input over the past several years through public

L1.2

meetings, written scoping comments, and one-on-one interaction with administrators and staff regarding the importance, protection and use of the Arboretum has been heard, valued and incorporated into these documents. Our Draft EIR comments, questions and concerns are as follows.

L1.2  
(cont.)

The project goals and objectives are well-stated in the Draft EIR Executive Summary. Information about existing Arboretum conditions in Section 2.3.3, project characteristics in Section 2.5, open space in Section 2.5.7, campus setting in Section 4.1.1 b, and visual character in Section 4.1 appears to be accurate. The Arboretum description in Section 4.10.a Setting is expressed appropriately. And the Friends particularly appreciate the Arboretum narrative in Section 4.10.1 Impact Analysis: “The Campus Master Plan would direct development that supports the mission of the Arboretum, protect its assets, and allows the facility to be self-sustaining.” And “Updates to existing Arboretum facilities are needed to support the facility’s mission and to continue the integration of the Arboretum with student, faculty, and community needs.”

The Friends believe that the concept of a ‘Green Loop’ winding throughout the campus, native landscaping, student harvest gardens, and the addition of more open space will enhance the aesthetics, livability and physical and mental well-being of students, faculty, staff, and visitors. There are opportunities in these improvements for botanical guidance from the Arboretum as well as integration of uses, interpretation, and education. Eventually, as with other great universities across the country, the entire campus could be thought of as an interconnected extension of an arboretum setting.

L1.3

An additional component of facility planning that we do not prominently see in the Draft EIR (but is in the Physical Master Plan, page 139) is the inclusion of more landscape-focused public art, of which there is none within or around the Arboretum (other than several older building murals). Art is an important visual element that brings a deeper meaning to the understanding and appreciation of nature, a concept incorporated into the grounds and programs of other major arboretums. The Friends support the Physical Master Plan ‘Art and Identity’ concept of nodal placement.

L1.4

The Friends agree with the Arboretum considerations listed in Section 4.10.1 and urge the University to, in partnership with the Friends and our shared communities of supporters, move forward to fund and implement needed Arboretum work in phases as outlined in the Draft EIR and Physical Master Plan.

L1.5

We also believe that it is of critical importance for any facility planning to continue to emphasize the leadership role the ArbNet IV-certified Fullerton Arboretum could increasingly play in sustainability, environmental stewardship, climate change, and conservation. These interdisciplinary fields are more relevant than ever and should inform and guide future Arboretum physical development and programming.

The Friends note, as discussed in Chapter 2, Project Description, and Section 4.10, Recreation, that there is no mention of the role that our organization has played as an authorized and valued University support group, sustaining the Arboretum for decades along with the City of Fullerton. The Friends were a guiding entity in its creation as well as in almost all projects, programs, and activities. Please incorporate a brief acknowledgement of our partnership here and elsewhere in the document as appropriate. The University and Friends executed a new multi-year support group agreement in May 2020.

L1.6

Most of our comments concern the Draft EIR Section 7, Alternatives.

The Friends whole-heartedly agree with the decision not to pursue a 'No Additional Arboretum Development' alternative as described in Section 7.3, Alternatives Considered but not Evaluated Further. The University must not allow the Fullerton Arboretum to 'stand still' without any recommended development or it will decay, wear-out and become irrelevant to the campus and the communities it serves. That in itself would be a significant adverse effect. Instead, it must continue to robustly renew and strengthen its infrastructure, collections, and programs to provide for future growth and use.

L1.7

CEQA requires a reasonable range of alternatives. The Friends wonder why a full adoption of the final Physical Master Plan, with no enrollment, academic space, or student housing constraints, was not selected as an alternative for detailed analysis.

L1.8

Alternative 1, Section 7.4.1, No Project Alternative, the Fullerton Arboretum is not mentioned at all. The effects here would resemble those described in Section 7.3 in which there would be no Arboretum improvements.

L1.9

Alternative 2, Section 7.4.2, Reduced Enrollment and Academic Space, does not specify what environmental impacts might affect the Fullerton Arboretum, if any; therefore, it is not possible for us to provide a comment. Please provide a brief description of possible Arboretum impacts and significance here.

L1.10

Alternative 3, Section 7.4.3, Increased Student Housing states that it is conceivable new student housing might encroach north and west into the Arboretum, leading to increased area density, light, and glare as well as decreased open space. There would be aesthetic impacts. There is no mention of the Arboretum in the Recreation section, although the Arboretum is described in other Recreation sections of the document. The Draft EIR further notes that this alternative may attain only a partial achievement of the Arboretum objective due to the possible encroachment and believes that impacts would be less than significant.

L1.11

While supportive of allowing more students to reside in University housing to further activate the 24/7 campus environment concept, the Friends believe that any intrusion into the east or south boundary of the Fullerton Arboretum by one or more new eastside housing clusters would be considered a very significant impact. Some aspects of the impacts would depend upon the location, size, construction methods, and use patterns.

As stated in Section 7.1 Alternatives, Introduction:

“The CEQA Guidelines require that the EIR include sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the proposed project. If an alternative would cause one or more significant effects in addition to those that would be caused by the project as proposed, the significant effects of the alternative must be discussed, but in less detail than the significant effects of the project as proposed (CEQA Guidelines Section 15126.6(d)).”

**We therefore request that the University strengthen the discussion (description, analysis, and findings) in greater detail for this part of Alternative 3 so that both**

**the public and decision maker have a clear understanding of potential environmental impacts.**

What housing is proposed, where (potential encroachment to the Arboretum boundary, a map would be helpful) and potential effects on the Arboretum collections and infrastructure would be valuable analysis.

There is no mention of possible mitigation measures.

Would there not also exist an opportunity to increase the height of student housing clusters or their campus location?

Student housing encroachment of the Arboretum boundary does not appear anywhere in the final Physical Master Plan (Buildout and 2025/2039) that accompanies the Draft EIR. In fact, the Plan highlights the importance of preserving and improving the Arboretum with no boundary encroachment.

L1.11  
(cont.)

Adding a possible student housing encroachment to a Draft EIR alternative at this late point in the planning process appears contrary to past University reassurances of Arboretum boundary integrity.

It confuses us throughout Section 7 of the Draft EIR that the Fullerton Arboretum is not mentioned in Recreation impacts although it is well described in other Recreation sections of the document.

The Friends are also confused by conflicting information in the Draft EIR and its accompanying Public Meeting Presentation document, page 29, which states:

**“Increased Student Housing Alternative:** The same components would be constructed as under the Campus Master Plan; however, the increase in student beds would be doubled from an additional 3,000 beds to 6,000 beds being constructed. No new buildings would be constructed, the additional 3,000 beds would be implemented by increasing the number of floors in three of the housing clusters (the staff/faculty housing would remain as proposed in the Campus Master Plan).”

L1.12

This alternative description in the Presentation appears to be contrary to the Draft EIR. This is a major difference for potential impacts to the Arboretum.

There are a number of locations in Section 7 that appear to contain typographic or sentence structural errors:

- Section 7.4, Alternatives Selected for Detailed Analysis, typo in last sentence of the Increased Student Housing Alternative, page 7-5: "...and an activated 2/47 campus environment." Should be 24/7.
- Alternative 3, Increased Student Housing, page 7-13 there are references to both 3,000 and 3,600 new beds. '3,600' appears to be a typo.
- In Public Services, page 7-15 the sentence: "As With...", 'with' should not be capitalized.
- In Recreation, page 7-15 the last sentence does not make sense. Perhaps remove the phrase 'a reduction in student enrollment'? Again, why no mention of the Arboretum here?
- In Relationship to Project Objectives, the sentence at the bottom of page 7-16. Should it state 'The Increased Student Housing Alternative...' not 'The Reduced Enrollment and Academic Space Alternative'?
- Section 7.5, Comparison of Alternatives, Table 7.1 Impact Comparison of Alternatives – Recreation has been omitted.
- Section 7.6, Environmentally Superior Alternative, page 7-19, second paragraph: "Alternative 3 would reduce some impacts but because additional student housing would be provided, impacts to transportation and \_\_\_\_\_? \_\_\_\_\_ would be greater." A gap here.

L1.13

It is not clear from the Campus Master Plan timeline and process chart who the Draft EIR decision maker is and if that person would have the ability to approve a modified alternative or one that might be comprised of selected portions of the three alternatives. For example, an Alternative 3.a., more student housing but with no encroachment of the Fullerton Arboretum boundary.

L1.14

Although the mission of the Fullerton Arboretum is mentioned in several locations throughout the Draft EIR, no reference is made in Section 8.1 Bibliography, Recreation, to the Fullerton Arboretum Strategic Plan 2005-2020, the guiding document with Arboretum Mission Statement and other strategic direction. The Friends request that this Plan, which the Draft EIR and Physical Master Plan tier to, be recognized and included as a source document.

L1.15

Also, as a general comment, we are a bit confused by the interchangeability of the terms 'campus master plan' and 'physical master plan' in the Draft EIR.

L1.16

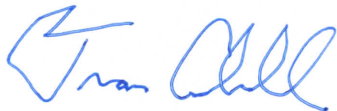

We see no other apparent factual errors or omissions in the Draft EIR, although at a challenging 2,466 pages in length our response may not be completely comprehensive.

We have no comments or concerns for the final version of the Physical Master Plan; in fact, it is very well-written, and we support it in its entirety.

The Friends of the Fullerton Arboretum encourage California State University, Fullerton to incorporate all of the goals, objectives, outcomes and best practices that preserve, support, and strengthen the Arboretum as described in the Draft EIR and Campus Master Plan into the selection of the final alternative. If that occurs, we would be confident that the Arboretum, with assistance from the Friends, could serve the entire campus as well as communities from across southern California and beyond as a world class, uniquely important University institution for decades to come. Please contact me if you have questions.

L1.17

To paraphrase Gifford Pinchot, first Chief of the United States Forest Service, the Friends believe there could be a consensus here for 'the greatest good for the greatest number for the longest time'.

## Letter L1

**COMMENTER:** Fran Colwell, President, Friends of the Fullerton Arboretum

**DATE:** June 12, 2020

### Comment L1.1

Thank you for the opportunity to review and comment on the California State University, Fullerton (CSUF) Physical Master Plan Draft Environmental Impact Report (EIR). The Friends of the Fullerton Arboretum (Friends) are a 501(c)3 non-profit partner committed to implementing the mission of the Arboretum for the last 45 years. We are supportive of the efforts to improve the campus through the strategic planning process. There is a compelling need for the development of quality facilities and infrastructure to accommodate both current campus use and anticipated future growth while also protecting and improving the botanical, physical, and historic resources of the Fullerton Arboretum. This must integrate with enhancement of academic purposes, student success, and community use.

### Response L1.1

The comment provides introductory statements about the Friends of Fullerton Arboretum (Friends) and the organization's mission and expresses support for the future development of facilities that both protect Arboretum resources and enhance its value for academic, student support, and community uses.

The comment is generally supportive and does not raise any environmental issues related to the adequacy of the EIR analysis, and no further response is required. The comment is included within the record for consideration by the decision makers as part of the Campus Master Plan approval process.

### Comment L1.2

The Draft EIR has been diligently researched and professionally composed by the University and Rincon Consultants, although the Friends have some concerns about portions of Section 7 as listed below. The accompanying final Physical Master Plan as developed by the University, Flad Architects, and other consultants is great, a significant improvement over earlier drafts. The graphics are of high quality in each document. This much-needed, state-of-the-art university strategic planning that will provide guidance for decades to come. The Friends are pleased that our input over the past several years through public meetings, written scoping comments, and one-on-one interaction with administrators and staff regarding the importance, protection, and use of the Arboretum has been heard, valued, and incorporated into these documents. Our Draft EIR comments, questions, and concerns are as follows.

### Response L1.2

The comment generally expresses support for the Campus Master Plan and Draft EIR, despite concerns about Section 7, *Alternatives* (presented in further detail in Comments L1.7 through L1.11), and also states the Friends' appreciation for the campus's solicitation of their input during development of the Master Plan.

The comment does not raise any specific environmental issues related to the adequacy of the EIR analysis, and no further response is required. The comment is included within the record for consideration by the decision makers as part of the Campus Master Plan approval process.

### Comment L1.3

The Friends believe that the concept of a ‘Green Loop’ winding throughout the campus, native landscaping, student harvest gardens, and the addition of more open space will enhance the aesthetics, livability, and physical and mental well-being of students, faculty, staff, and visitors. There are opportunities in these improvements for botanical guidance from the Arboretum as well as integration of uses, interpretation, and education. Eventually, as with other great universities across the country, the entire campus could be thought of as an interconnected extension of an arboretum setting.

### Response L1.3

The comment states support for the “Green Loop” concept included in the Physical Master Plan, and a desire to see the entire campus treated as an extension of the arboretum, as college and university campuses around the country have done.

The “Green Loop” serves as a practical and functional purpose for the campus as it connects every major building including the arboretum, student housing and other student life uses. It is outlined as a key open space element in the Campus Master Plan. The comment does not raise any environmental issues related to the adequacy of the EIR analysis, and no further response is required. The comment is included within the record for consideration by the decision makers as part of the Campus Master Plan approval process.

### Comment L1.4

An additional component of facility planning that we do not prominently see in the Draft EIR (but is in the Physical Master Plan, page 139) is the inclusion of more landscape-focused public art, of which there is none within or around the Arboretum (other than several older building murals). Art is an important visual element that brings a deeper meaning to the understanding and appreciation of nature, a concept incorporated into the grounds and programs of other major arboretums. The Friends support the Physical Master Plan ‘Art and Identity’ concept of nodal placement.

### Response L1.4

The comment states support for the Campus Master Plan’s “Art and Identity” concept of nodal placement, which recommends public art throughout the campus, and notes that this concept is not prominently discussed in the Draft EIR but is in the Campus Master Plan. Pages 2-24 and 2-25 of Section 2, *Project Description*, reiterate the recommendations set forth in the Campus Master Plan for the strategic placement of art in the Events and Innovation and Mobility Hub and Entrance Districts. The Campus Master Plan document provides considerably more detail about proposed plans for landscaping and public art than is contained in the Draft EIR, which necessarily focuses on those physical and operational components of the Campus Master Plan with the potential to result in significant environmental impacts, as required by CEQA. Nonetheless, the Campus Master Plan is intended to guide comprehensive implementation through buildout in 2039, and the absence of

detailed discussion in the Draft EIR of landscape-focused public art on the campus does not mean this concept is not part of future plans for the campus.

The comment does not raise any environmental issues related to the adequacy of the EIR analysis, and no further response is required. The comment is included within the record for consideration by the decision makers as part of the Campus Master Plan approval process.

### Comment L1.5

The Friends agree with the Arboretum considerations listed in Section 4.10.1 and urge the University to, in partnership with the Friends and our shared communities of supporters, move forward to fund and implement needed Arboretum work in phase as outlined in the Draft EIR and Physical Master Plan. We also believe that it is of critical importance for any facility planning to continue to emphasize the leadership role the ArbNet IV-certified Fullerton Arboretum could increasingly play in sustainability, environmental stewardship, climate change, and conservation. These interdisciplinary fields are more relevant than ever and should inform and guide future Arboretum physical development and programming.

### Response L1.5

The comment states agreement with the improvements proposed for the Arboretum in the impact analysis portion of Section 4.10, *Recreation*, of the Draft EIR and encourages CSUF to move forward with improvements and development of facilities as planned.

The comment does not raise any environmental issues related to the adequacy of the EIR analysis, and no further response is required. The comment is included within the record for consideration by the decision makers as part of the Campus Master Plan approval process.

### Comment L1.6

The Friends note, as discussed in Section 2, *Project Description*, and Section 4.10, *Recreation*, that there is no mention of the role that our organization has played as an authorized and valued University support group, sustaining the Arboretum for decades along the City of Fullerton. The Friends were a guiding entity in its creation as well as in almost all projects, programs, and activities. Please incorporate a brief acknowledgement of our partnership here and elsewhere in the document as appropriate. The University and Friends executed a new multi-year support group agreement in May 2020.

### Response L1.6

The comment requests acknowledgement of Friends as an authorized and valued partner for the decades of sustainment of the Arboretum in the *Project Description*, Section 4.10, *Recreation*, and other areas of the EIR as appropriate.

The comment does not raise any environmental issues related to the adequacy of the EIR analysis. CSUF highly values the role that Friends plays in the operation and sustainment of the Arboretum and appreciates their involvement in the development of the Campus Master Plan.

However, comment does not raise any environmental issues related to the adequacy of the EIR. The comment is included within the record for consideration by the decision makers as part of the Campus Master Plan approval process.

### Comment L1.7

The Friends whole-heartedly agree with the decision to not pursue a “No Additional Arboretum Development” alternative as described in Section 7.3, *Alternatives Considered but not Evaluated Further*. The University must not allow the Fullerton Arboretum to ‘stand still’ without any recommended development or it will decay, wear-out and become irrelevant to the campus and the community it serves. That in itself would be a significant adverse effect. Instead, it must continue to robustly renew and strengthen its infrastructure collections, and programs to provide for future growth and use.

### Response L1.7

The comment states support for the Draft EIR’s recommendation not to pursue a “No Additional Arboretum Development” alternative as described in Section 7, *Alternatives*, within Section 7.3, *Alternatives Considered but not Evaluated Further*.

The comment does not raise any environmental issues related to the adequacy of the EIR analysis, and no further response is required. The comment is included within the record for consideration by the decision makers as part of the Campus Master Plan approval process.

### Comment L1.8

CEQA requires a reasonable range of alternatives. The Friends wonder why a full adoption of the final Physical Master Plan, with no enrollment, academic space, or student housing constraints, was not selected as an alternative for detailed analysis.

### Response L1.8

The comment questions why an alternative with no enrollment, academic space, or student housing constraints, was not selected as an alternative for detailed analysis.

The development and discussion of alternatives is guided by Section 15126.6(a), of the CEQA Guidelines, requiring EIRs to describe a range of reasonable alternatives to the project. An EIR is not required to consider alternatives that are infeasible. CEQA Guidelines Section 15126.6(b) further states the discussion of alternatives shall focus on alternatives to the project or its location which are capable of avoiding or substantially lessening any significant effects of the project, even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly.

The entirety of the proposed Campus Master Plan project, as described in Section 2, *Project Description*, and analyzed in detail in the technical sections within Section 4 of the Draft EIR, is the project for which CSUF seeks approval. Section 7, *Alternatives*, does not re-evaluate the proposed project itself (since the project has already been evaluated in Section 4), nor are the alternatives evaluated in Section 7 necessarily proposed or considered for approval in lieu of the proposed project. As discussed above, this section is required by CEQA to ensure the comparative evaluation of *alternatives to the project itself* is undertaken, for the express purpose of determining whether there are feasible ways to reduce the project’s significant environmental impacts while still fulfilling a majority of the project objectives. If, as in this Draft EIR, the alternatives are determined to be infeasible, would not lessen the project’s significant impacts, and/or would not fulfill a majority of the project objectives, those alternatives may be rejected in favor of the original project.

### Comment L1.9

Alternative 1, Section 7.4.1, No Project Alternative, the Fullerton Arboretum is not mentioned at all. The effects here would resemble those described in section 7.3 in which there would be no Arboretum improvements.

### Response L1.9

The comment states that the Arboretum is not mentioned in Alternative 1, No Project Alternative, and concludes that the impacts of the No Project Alternative would resemble those described in Section 7.

The comment is correct in its conclusion. However, the discussion in Section 7, *Alternatives*, focuses on impacts resulting from each identified alternative rather than presenting a list of all areas of campus that are not impacted. No changes are required to the Draft EIR text as a result of this comment.

### Comment L1.10

Alternative 2, Section 7.4.2, Reduced Enrollment and Academic Space, does not specify what environmental impacts might affect the Fullerton Arboretum, if any; therefore, it is not possible for us to provide a comment. Please provide a brief description of possible Arboretum impacts and significance here.

### Response L1.10

The comment states that the Arboretum is not mentioned in Alternative 2, Reduced Enrollment and Academic Space, and requests information on potential impacts to the Arboretum.

The discussion in Section 7, *Alternatives*, focuses on impacts resulting from each identified alternative rather than presenting a list of all areas of campus that are not impacted. Nonetheless, page 7-9 of Section 7, *Alternatives*, is revised as follows:

#### 7.4.2 Alternative 2: Reduced Enrollment and Academic Space

Under the Reduced Enrollment and Academic Space Alternative, most aspects of the Campus Master Plan would still be implemented. The buildings proposed for renovation, such as McCarthy Hall, Langsdorf Hall, the Pollak Library, the Visual Arts complex, and the Humanities Social Sciences building, would still be renovated as under the Campus Master Plan. The new event center, mobility hubs, parking structures, new innovation center, proposed Arboretum improvements, and the four new student/faculty housing clusters would continue to be implemented as proposed under the Campus Master Plan.

Additionally, page 7-11 of Section 7, *Alternatives*, is revised as follows:

#### Recreation

The Campus Master Plan was determined not to result in a significant increase in the use of neighborhood and regional parks or other recreational facilities, nor would it include or require the construction of such facilities, potentially causing significant environmental impacts in their own right, would be required to ensure the continued adequate provision of such services. As the Reduced Enrollment and

Academic Space Alternative represents a reduction in student enrollment and a reduced need for academic space, impacts on on-campus facilities, including the Arboretum, and off-campus parks and recreational facilities would likewise be less than significant and would be reduced compared to the Campus Master Plan. (*Less impact*)

## Comment L1.11

Alternative 3, Section 7.4.3, Increased Student Housing states that it is conceivable new student housing might encroach north and west into the Arboretum, leading to increased area density, light, and glare as well as decreased open space. There would be aesthetic impacts. There is no mention of the Arboretum in the Recreation section, although the Arboretum is described in other Recreation sections of the document. The Draft EIR further notes that this alternative may attain only a partial achievement of the Arboretum objective due to the possible encroachment and believes that impacts would be less than significant.

While supportive of allowing more students to reside in University housing to further activate the 24/7 campus environment concept, the Friends believe that any intrusion into the east or south boundary of the Fullerton Arboretum by one or more new eastside housing clusters would be considered a very significant impact. Some aspects of the impacts would depend upon the location, size, construction methods, and use patterns.

As stated in Section 7.1 Alternatives, Introduction:

"The CEQA Guidelines require that the EIR include sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the proposed project. If an alternative would cause one or more significant effects in addition to those that would be caused by the project as proposed, the significant effects of the alternative must be discussed, but in less detail than the significant effects of the project as proposed (CEQA Guidelines Section 15126.6(d))." We therefore request that the University strengthen the discussion (description, analysis, and findings) in greater detail for this part of Alternative 3 so that both **the public and decision maker have a clear understanding of potential environmental impacts.**

What housing is proposed, where (potential encroachment to the Arboretum boundary, a map would be helpful) and potential effects on the Arboretum collections and infrastructure would be valuable analysis.

There is no mention of possible mitigation measures.

Would there not also exist an opportunity to increase the height of student housing clusters or their campus location?

Student housing encroachment of the Arboretum boundary does not appear anywhere in the final Physical Master Plan (Buildout and 2025/2039) that accompanies the Draft EIR. In fact, the Plan highlights the importance of preserving and improving the Arboretum with no boundary encroachment.

Adding a possible student housing encroachment to a Draft EIR alternative at this late point in the planning process appears contrary to past University reassurances of Arboretum boundary integrity.

It confuses us throughout Section 7 of the Draft EIR that the Fullerton Arboretum is not mentioned in Recreation impacts although it is well described in other Recreation sections of the document.

## Response L1.11

The comment states several concerns with Alternative 3, Increased Student Housing, the description of environmental impacts associated with Alternative 3, and conflicting information in the Public Meeting Presentation.

As stated on page 7-1 of Section 7, *Alternatives*, CEQA requires an EIR to describe a reasonable range of alternatives to a project or to the location of a project that feasibly attains most of the project's basic objectives but avoids or substantially lessens any of the project's significant environmental impacts. The alternatives presented in Section 7 of the Draft EIR were developed in compliance with the CEQA Guidelines, which also state that sufficient information must be provided to allow for meaningful evaluation, analysis, and comparison with the impacts of the proposed project. The major characteristics and significant environmental effects of each alternative have been provided in compliance with Section 15126.6(d); however, alternatives were not developed or evaluated in the same level of detail as the Campus Master Plan, and as part of that, mitigation measures were not required or developed. Therefore, the precise location of the additional student housing was not determined in the EIR; the analysis that was undertaken was sufficient to demonstrate that there are few options for expanding student housing on the east side of the campus that don't adversely impact the Arboretum. Statements regarding potential encroachment into the Arboretum were speculative in nature, and the alternatives analysis concluded that Alternative 3 was not the preferred alternative, partially because it would not achieve the following important Campus Master Plan objective, to which CSUF is committed:

- As the campus resumes primary responsibility for management of the Arboretum, balance preservation of its natural and historic resources, protection of its function as a place of solitude and reflection for campus and community members, and enhancement of its use for academic purposes.

Section 7, *Alternatives*, focuses on the impacts that would result from each alternative, and does not discuss aspects of the campus that would not be impacted. If the Arboretum is not specifically mentioned in the alternatives analysis, it is because no new impacts are assumed under the alternative.

## Comment L1.12

The Friends are also confused by conflicting information in the Draft EIR and its accompanying Public Meeting Presentation document, page 29, which states:

**"Increased Student Housing Alternative:** The same components would be constructed as under the Campus Master Plan; however, the increase in student beds would be doubled from an additional 3,000 beds to 6,000 beds being constructed. No new buildings would be constructed, the additional 3,000 beds would be implemented by increasing the number of floors in three of the housing clusters (the staff/faculty housing would remain as proposed in the Campus Master Plan). "

This alternative description in the Presentation appears to be contrary to the Draft EIR. This is a major difference for potential impacts to the Arboretum.

## Response L1.12

The commenter is correct that information presented on Alternative 3 in the Public Meeting Presentation conflicted with what was presented in the Draft EIR. The Public Meeting Presentation

has been revised to reflect accurate information and re-posted online. The error does not raise any environmental issues related to the adequacy of the EIR analysis, and no further response is required.

### Comment L1.13

There are a number of locations in Section 7 that appear to contain typographic or sentence structural errors:

- Section 7.4, Alternatives Selected for Detailed Analysis, typo in last sentence of the Increased Student Housing Alternative, page 7-5: "...and an activated 2/47 campus environment." Should be 24/7.
- Alternative 3, Increased Student Housing, page 7-13 there are references to both 3,000 and 3,600 new beds. '3,600' appears to be a typo.
- In Public Services, page 7-15 the sentence: "As With...", 'with' should not be capitalized.
- In Recreation, page 7-15 the last sentence does not make sense. Perhaps remove the phrase 'a reduction in student enrollment'? Again, why no mention of the Arboretum here?
- In Relationship to Project Objectives, the sentence at the bottom of page 7-16. Should it state 'The Increased Student Housing Alternative...' not 'The Reduced Enrollment and Academic Space Alternative'?
- Section 7.5, Comparison of Alternatives, Table 7.1 Impact Comparison of Alternatives - Recreation has been omitted.
- Section 7.6, Environmentally Superior Alternative, page 7-19, second paragraph: "Alternative 3 would reduce some impacts but because additional student housing would be provided, impacts to transportation and ? would be greater." A gap here.

### Response L1.13

The comment makes note of typographical errors in Section 7, which is revised as follows in response to these comments:

- Page 7-5 of Section 7.4, *Alternatives Selected for Detailed Analysis*, under the Increased Student Housing Alternative, is revised as follows:  
This alternative was selected for evaluation for its potential to reduce the Campus Master Plan's significant and unavoidable impacts related to air quality and GHG emissions and further reduce VMT while still meeting a majority of project objectives, including the objectives related to the provision of additional student housing and an activated ~~2/47~~ 24/7 campus environment.
- Page 7-15 of Section 7.4, *Alternatives Selected for Detailed Analysis*, under the Public Services discussion, is revised as follows:
  - As ~~With~~ with the only significant difference being an increase in student housing on campus, impacts to public services under the Increased Student Housing Alternative would likewise be less than significant and would be reduced compared to the Campus Master Plan. (*Less impact*)
- Page 7-15 of Section 7.4, *Alternatives Selected for Detailed Analysis*, under the Recreation discussion, is revised as follows:

The Campus Master Plan was determined not to result in a significant increase in the use of neighborhood and regional parks or other recreational facilities, nor would it include or require the construction of such facilities, potentially causing significant environmental impacts in their own right, would be required to ensure the continued adequate provision of such services. As the Increased Student Housing Alternative represents only an increase in student housing on campus, ~~a reduction in student enrollment~~, impacts on off-campus parks and recreational facilities would likewise be less than significant and would be reduced compared to the Campus Master Plan. (*Less impact*)

- Page 7-17 of Section 7.4.3, *Relationship to Project Objectives*, is revised as follows:

The ~~Reduced Enrollment and Academic Space~~ Increased Student Housing Alternative has the potential to enable only partial achievement of the following project objective related to the Arboretum, since the additional student housing complexes could conceivably require encroachment on Arboretum land because of other physical constraints to the east, west and south:

- As the campus resumes primary responsibility for management of the Arboretum, balance preservation of its natural and historic resources, protection of its function as a place of solitude and reflection for campus and community members, and enhancement of its use for academic purposes.
- Table 7.1, Impact Comparison of Alternatives, on page 7-18 of Section 7.5, *Comparison of Alternatives*, is revised as follows:

**Table 7-1 Impact Comparison of Alternatives**

Issue	Campus Master Plan Impact Classification	Alternative 1: No Project	Alternative 2: Reduced Enrollment and Academic Space	Alternative 3: Increased Student Housing
Aesthetics	LTS	<	<	>
Air Quality	SU	< (construction) < (operational)	< (construction) < (operational)	> (construction) < (operational)
Cultural Resources	SM	<	= (historical) < (archeological)	= (historical) > (archaeological)
Energy	LTS	<	<	>
GHG	SU	< (construction) < (operational)	< (construction) < (operational)	< (construction) > (operational)
Noise	SM	= (construction) > (operational)	< (construction) < (operational)	< (construction) > (operational)
Population/Housing	LTS	<	<	<
Public Services	LTS	<	<	<
<u>Recreation</u>	<u>LTS</u>	≤	≤	≤

Issue	Campus Master Plan Impact Classification	Alternative 1: No Project	Alternative 2: Reduced Enrollment and Academic Space	Alternative 3: Increased Student Housing
Transportation and Traffic	LTS	>	<	<
Utilities and Service Systems	SM	<	<	>

< Impacts would be less than the Campus Master Plan  
 > Impacts would be greater than the Campus Master Plan  
 = Similar level of impact to the Campus Master Plan  
 LTS – Less than Significant  
 SM – Significant but Mitigable  
 SU – Significant and Unavoidable

- Page 7-19 of Section 7.6, *Environmentally Superior Alternative*, is revised as follows:  
 Alternative 3 would reduce some impacts but because additional student housing would be provided, impacts to transportation, aesthetics, air quality, cultural resources, energy, GHG, noise, and utilities and service systems would be greater.

**Comment L1.14**

It is not clear from the Campus Master Plan timeline and process chart who the Draft EIR decision maker is and if that person would have the ability to approve a modified alternative or one that might be comprised of selected portions of the three alternatives. For example, an Alternative 3.a., more student housing but with no encroachment of the Fullerton Arboretum boundary.

**Response L1.14**

The commenter states they are not clear who the decision-maker is for consideration and certification of the Campus Master Plan EIR or what the approval timeline is for the Campus Master Plan.

As stated in Section 1, *Introduction*, the CEQA Guidelines define lead, responsible and trustee agencies. The California State University, Board of Trustees (Trustees) is the lead agency because it holds principal responsibility for approving the Campus Master Plan. Following release for public review of this Final EIR, the Trustees will consider the CSUF Campus Master Plan for approval, and the Draft EIR for certification, at their July 2020 board meeting (July 21-22, 2020). The campus seeks approval of the proposed Campus Master Plan; the alternatives evaluated do not meet the project objectives presented in Section 2, *Project Description*, and do not reduce overall project impacts. Once approved, any substantive changes to the Campus Master Plan would be required to go through subsequent evaluation to determine the need for additional CEQA review.

The comment does not raise any environmental issues related to the adequacy of the EIR analysis, and no further response is required. The comment is included within the record for consideration by the decision makers as part of the Campus Master Plan approval process.

### Comment L1.15

Although the mission of the Fullerton Arboretum is mentioned in several locations throughout the Draft EIR, no reference is made in Section 8.1 Bibliography, Recreation, to the Fullerton Arboretum Strategic Plan 2005-2020, the guiding document with Arboretum Mission Statement and other strategic direction. The Friends request that this Plan, which the Draft EIR and Physical Master Plan tier to, be recognized and included as a source document.

### Response L1.15

The comment requests inclusion of the *Fullerton Arboretum Strategic Plan 2005-2020* in the References section.

Page 8-13 of Section 8, *References*, of the Final EIR is revised to include reference to this document.

### Comment L1.16

Also, as a general comment, we are a bit confused by the interchangeability of the terms 'campus master plan' and 'physical master plan' in the Draft EIR.

### Response L1.16

Page ES-1 states that the Draft EIR is an environmental analysis of the California State University, Fullerton, (CSUF) Physical Master Plan, which serves as a guide for improving existing facilities and guiding new on-campus construction through 2039, including the improvement of recreational facilities and academic buildings, the addition of on campus housing, and improvement of multi-modal circulation. The Campus Master Plan provides a framework for managing future campus growth and needs, as well as the campus's relationship with the City, and serves as a detailed guidance document for use during Master Plan implementation. The Draft EIR refers to this document as the Campus Master Plan, but the two are one and the same, and those physical and operational characteristics of the Physical Master Plan that have the potential to result in significant environmental impacts for the subject of analysis in the Draft EIR. This is clarified on page ES-1.

One erroneous reference to the Physical Master Plan was found on page 4.8-7 of Section 4.8, *Population and Housing*, and this has been corrected to refer to the Campus Master Plan.

### Comment L1.17

We see no other apparent factual errors or omissions in the Draft EIR, although at a challenging 2,466 pages in length our response may not be completely comprehensive.

We have no comments or concerns for the final version of the Physical Master Plan; in fact, it is very well-written, and we support it in its entirety.

The Friends of the Fullerton Arboretum encourage California State University, Fullerton to incorporate all of the goals, objectives, outcomes and best practices that preserve, support, and strengthen the Arboretum as described in the Draft EIR and Campus Master Plan into the selection of the final alternative. If that occurs, we would be confident that the Arboretum, with assistance from the Friends, could serve the entire campus as well as communities from across southern California and beyond as a world class, uniquely important University institution for decades to come. Please contact me if you have questions.

### **Response L1.17**

The comment supports approval of the Campus Master Plan as proposed and evaluated in the Draft EIR, and the goals, objectives, outcomes and best practices that preserve, support, and strengthen the Arboretum as described in the Draft EIR.

The comment does not raise any environmental issues related to the adequacy of the EIR analysis, and no further response is required. The comment is included within the record for consideration by the decision makers as part of the Campus Master Plan approval process.

**From:** [REDACTED]  
**Sent:** Thursday, June 18, 2020 10:10 AM  
**To:** Campus Master Plan <[campusmasterplan@Fullerton.edu](mailto:campusmasterplan@Fullerton.edu)>  
**Subject:** Master Plan feedback from the web

Hello,

A user has sent feedback in regards to the Campus Master Plan.

Comments: Fullerton Heritage is a local non-profit organization of 28 years whose mission is to ensure the preservation of Fullerton's historic architectural resources and environments. In our review of the Draft EIR of the Master Plan for CSUF, the focus was on the cultural and historical resources section of this document. Fullerton Heritage finds the description and analysis to identify the buildings on the campus that have important cultural and historical content to be both informative and comprehensive. We are pleased that the historic resources survey has identified 13 buildings on the campus as a historical resource, eligible for placement either on the National Register of Historic Places or the California Register of Historic Resources. More importantly, however, the mitigation measures that have been drafted and described in the Project Impact Analysis of this section of the Draft EIR (section 4.3, pages 42 thru 50) ensures that these 13 identified buildings will be given special consideration, if not protection, from any proposed future development on the campus resulting from the adoption of the Master Plan. Fullerton Heritage is particularly interested in the protection and preservation of the three oldest buildings on the campus: Heritage House (Dr. George C. Clark House and Office) on the grounds of the Fullerton Arboretum; Titan House (Henry T. Hetebrink House); and the George G. Golleher Alumni House (Mahr House/Lottie M. Hetebrink House). We are pleased to see that each of these buildings is not endangered with potential or future development with the proposed Master Plan. That said, Fullerton Heritage would like to recommend, even request, that the two buildings connected with pioneer Hetebrink family – Titan House and the George G. Golleher Alumni House – be nominated for listing on the National Register of Historic Places. (The third building, Heritage House, has already been placed on the National Register). The National Register listing of these two buildings would provide more recognition to their historic nature as well as give additional prestige to the University. If the University is interested in pursuing National Register listing of these two buildings, Fullerton Heritage would be glad to assist the University in this endeavor. Fullerton Heritage has submitted over a dozen applications of buildings in the city of Fullerton for their consideration of being placed on the National Register, and all of them have been successful. Bob Linnell, Secretary Fullerton Heritage

## Letter L2

**COMMENTER:** Bob Linnell, Fullerton Heritage

**DATE:** June 18, 2020

### Comment L2.1

Fullerton Heritage is a local non-profit organization of 28 years whose mission is to ensure the preservation of Fullerton's historic architectural resources and environments. In our review of the Draft EIR of the Master Plan for CSUF, the focus was on the cultural and historical resources section of this document. Fullerton Heritage finds the description and analysis to identify the buildings on the campus that have important cultural and historical content to be both informative and comprehensive. We are pleased that the historic resources survey has identified 13 buildings on the campus as a historical resource, eligible for placement either on the National Register of Historic Places or the California Register of Historic Resources. More importantly, however, the mitigation measures that have been drafted and described in the Project Impact Analysis of this section of the Draft EIR (section 4.3, pages 42 thru 50) ensures that these 13 identified buildings will be given special consideration, if not protection, from any proposed future development on the campus resulting from the adoption of the Master Plan. Fullerton Heritage is particularly interested in the protection and preservation of the three oldest buildings on the campus: Heritage House (Dr. George C. Clark House and Office) on the grounds of the Fullerton Arboretum; Titan House (Henry T. Hetebrink House); and the George G. Golleher Alumni House (Mahr House/Lottie M. Hetebrink House). We are pleased to see that each of these buildings is not endangered with potential or future development with the proposed Master Plan. That said, Fullerton Heritage would like to recommend, even request, that the two buildings connected with pioneer Hetebrink family – Titan House and the George G. Golleher Alumni House – be nominated for listing on the National Register of Historic Places. (The third building, Heritage House, has already been placed on the National Register). The National Register listing of these two buildings would provide more recognition to their historic nature as well as give additional prestige to the University. If the University is interested in pursuing National Register listing of these two buildings, Fullerton Heritage would be glad to assist the University in this endeavor. Fullerton Heritage has submitted over a dozen applications of buildings in the city of Fullerton for their consideration of being placed on the National Register, and all of them have been successful.

### Response L2.1

The comment states that Fullerton Heritage supports the cultural resource mitigation measures proposed for the protection of the 13 identified structures on the National Register of Historic Places or the California Register of Historic Places. Fullerton Heritage requests that two campus buildings –Titan House and the George G. Golleher Alumni House – be nominated for listing on the National Register of Historic Places and offers that Fullerton Heritage would be able to assist with this action.

The comment does not raise any environmental issues related to the adequacy of the EIR analysis, and no further response is required. It should be noted that the Campus Master Plan does not propose any changes to the Titan House or the George G. Golleher Alumni House, as shown in Figures 2-25 and 2-26, in Section 2, *Project Description*. The comment is included within the record for consideration by the decision makers as part of the Campus Master Plan approval process.

**Subject:** Master Plan feedback from the web

Hello,

A user has sent feedback in regards to the Campus Master Plan.

Comments: The following comments originate from the City of Placentia's development as it pertains to the Draft EIR for Cal State Fullerton's campus Physical Master Plan. The draft plan has been received favorably with comments limited to circulation/mobility only. The following comments have been prepared to address the CSUF Master Plan CEQA DEIR: 1. The City of Placentia is actively working with the Orange County Transportation Authority, Metrolink, and Burlington Northern Santa Fe to establish a new Metrolink train station in the Old Town area (approximately 1-mile from CSUF). Additionally, new land development is underway within the City's Packing House District that is expected to attract CSUF students, faculty, and staff. The City is interested in collaborating with CSUF and other partners to provide enhanced transit and active transportation connections between the campus and the future train station and Packing House District. 2. The City of Placentia is supportive of Page 4.11-8 identified Transportation Demand Management (TDM) measures and Page 4.11-17 measures to improve and support bicycle and pedestrian infrastructure. We look forward to collaboration with CSUF, the City of Fullerton, and Caltrans on DEIR Page 4.11-7 concepts to improve active transportation crossing of State Route 57 (SR-57) at: a. Nutwood Avenue; b. Yorba Linda Boulevard; and c. A new bicycle/pedestrian overcrossing over SR-57 as identified on DEIR Page 4.11-7 and in the Fullerton Bike Connection Fullerton Plan (2017). 3. All road closures impeding and/or impacting City of Placentia should be reviewed and approved by the City's Transportation Manager. Should you have any questions and/or concerns, please do not hesitate to contact me Andrew Gonzales, Senior Planner, [REDACTED] or via email at [REDACTED] Andrew Gonzales Senior Planner City of Placentia

L3.2

L3.3

## Letter L3

**COMMENTER:** Andrew Gonzales, Senior Planner, City of Placentia

**DATE:** June 19, 2020

### Comment L3.1

The City of Placentia is actively working with the Orange County Transportation Authority, Metrolink, and Burlington Northern Santa Fe to establish a new Metrolink train station in the Old Town area (approximately 1-mile from CSUF). Additionally, new land development is underway within the City's Packing House District that is expected to attract CSUF students, faculty, and staff. The City is interested in collaborating with CSUF and other partners to provide enhanced transit and active transportation connections between the campus and the future train station and Packing House District.

### Response L3.1

The comment states that the City of Placentia is actively working with to establish a new Metrolink train station in the Old Town area (approximately one mile from CSUF), near land development within the City's Packing House District. The City is interested in collaborating with CSUF to establish multi-modal transportation connections in the area.

As stated in Response S1.8, future transit service will be provided from the planned Metrolink station at Placentia, and continued CSUF collaboration with neighboring jurisdictions on future transit service is anticipated. The comment does not raise any environmental issues related to the adequacy of the EIR analysis, and no further response is required. The comment is included within the record for consideration by the decision makers as part of the Campus Master Plan approval process.

### Comment L3.2

The City of Placentia is supportive of Page 4.11-8 identified Transportation Demand Management (TDM) measures and Page 4.11-17 measures to improve and support bicycle and pedestrian infrastructure. We look forward to collaboration with CSUF, the City of Fullerton, and Caltrans on DEIR Page 4.11-7 concepts to improve active transportation crossing of State Route 57 (SR-57) at: a. Nutwood Avenue; b. Yorba Linda Boulevard; and c. A new bicycle/pedestrian overcrossing over SR-57 as identified on DEIR Page 4.11-7 and in the Fullerton Bike Connection Fullerton Plan (2017).

### Response L3.2

The comment states that the City of Placentia is supportive of the identified Transportation Demand Management (TDM) measures and measures to improve and support bicycle and pedestrian infrastructure included in the Campus Master Plan and Draft EIR. Continued collaboration is desired.

The comment refers to Section 4.11, *Transportation*, that describes existing and proposed bicycle and pedestrian facilities in the vicinity of the campus, included in the Transportation Impact Study (TIS), included as Appendix M in the Draft EIR. The Campus Master Plan proposes short-term and long-term TDM measures on page 4.8-9 to facilitate active transportation and transit opportunities for the campus population, including a pedestrian crossing over Nutwood Avenue.

The comment does not raise any environmental issues related to the adequacy of the EIR analysis, and no further response is required. The comment is included within the record for consideration by the decision makers as part of the Campus Master Plan approval process.

### **Comment L3.3**

All road closures impeding and/or impacting City of Placentia should be reviewed and approved by the City's Transportation Manager. Should you have any questions and/or concerns, please do not hesitate to contact me Andrew Gonzales, Senior Planner, at (714) 993-8124 or via email at [agonzales@placentia.org](mailto:agonzales@placentia.org).

### **Response L3.3**

The comment requests that the City of Placentia be given opportunity to review and approve future road closures. Comment provides contact information.

The comment does not raise any environmental issues related to the adequacy of the EIR analysis, and no further response is required. The comment is included within the record for consideration by the decision makers as part of the Campus Master Plan approval process.

Mr. Emil Zordilla  
Director, Planning and Design  
California State University, Fullerton  
800 N. State College Boulevard  
Fullerton, CA 92831

**Subject: California State University, Fullerton Campus Master Plan Update Notice of Availability and Public Comment Opportunity for a Draft Environmental Impact Report**

Dear Mr. Zordilla,

Thank you for providing the Orange County Transportation Authority (OCTA) with an opportunity to provide input on the Draft Environmental Impact Report (DEIR). The following comments are provided for your consideration:

- The transit paragraphs describing Route 24 are out of date and no longer needed. Please update as appropriate. L4.1
- Please use the following language to describe Route 123:
  - "In February 2020, OCTA combined Route 24 with Route 21 to become the new Route 123. When east of the Buena Park Metrolink Station, Route 123 travels predominantly down Malvern Avenue and Chapman Avenue past CSUF using the old Route 24 routing and terminates at the Anaheim Canyon Metrolink Station instead of the Village of Orange in the east. When traveling west of the Buena Park Metrolink Station, it uses the old Route 21 alignment on Valley View Boulevard and terminates at the Golden West Transportation Center in Huntington Beach. Route 123 continues to have approximately one-hour headways between 5:30 a.m. and 9:00 p.m. on weekdays. This route does not operate on weekends."
- The last bullet located on page 4.11-4 of the DEIR, Stop ID 1864 should be updated since it is now served by Route 123 instead of Route 24. L4.2
- Section 4.11 "Transportation", and Appendix M "Traffic Impact Analysis" do not address impacts to the Congestion Management Program (CMP) Highway System (HS). While the California Environmental Quality Act (CEQA) now uses vehicle miles traveled to identify transportation impacts, L4.3

OCTA still requires level of service analysis to monitor CMP Highway System performance.

- The CMP analysis can be provided to OCTA separately from the CEQA document. We would request this analysis be performed and provided to OCTA as soon as feasible. Please refer to Appendix B-1: *Meeting CMP Traffic Impact Analysis Requirements* and Appendix B-2: *Traffic Impact Analysis Exempt Projects* in the 2019 CMP Report available here: <http://www.octa.net/pdf/2019CMP.pdf?n=201911>
  - Please note that State College Boulevard and Orangethorpe Avenue are part of the CMP Highway System. Additionally, the State College Boulevard/Orangethorpe Avenue and State College Boulevard/State Route 91 ramp intersections are CMP intersections. These roadways and intersections should be analyzed as such for any potential traffic impacts consistent with the Orange County CMP.
- Attachment M, Traffic Impact Study, Roadway Network, pages 2-3 do not accurately describe the following roadways:
  - Associated Road is described as a secondary arterial with four undivided travel lanes. Though the classification is correct, Associated Road is currently built as a four-lane, divided roadway north of Yorba Linda Boulevard.
  - Bastanchury Road is described as a major arterial with five divided travel lanes. Though the classification is correct, Bastanchury Road is built as a four- to five-lane, divided roadway between State College Blvd and State Route 57.
  - Bradford Avenue is described as a local street collector with two undivided travel lanes. According to the City of Fullerton's (City) Circulation Element and the MPAH, Bradford Avenue is classified as a secondary arterial. Additionally, Bradford Avenue is built as a two-lane, undivided to a four-lane, undivided roadway.
  - Chapman Avenue is described as a major arterial between State College and Placentia Avenue with six divided travel lanes and a primary west of State College Boulevard with four divided travel lanes. The classification is correct; however, Chapman Avenue is built as a five-lane, divided roadway between State College and Placentia Avenue.
  - Commonwealth Avenue is described as a primary arterial highway with four undivided travel lanes. Commonwealth Avenue between Nutwood Avenue and Chapman Avenue is classified as a major arterial in the City's General Plan and a primary arterial in the

Throughout the development of this project, we encourage communication with OCTA on any matters discussed herein. If you have any questions or comments, please contact me at (714) 560-5907 or [dphu@octa.net](mailto:dphu@octa.net).

Sincerely,

Dan Phu  
Manager, Environmental Programs

## Letter L4

**COMMENTER:** Dan Phu, Manager, Environmental Programs, Orange County Transportation Authority (OCTA)

**DATE:** June 19, 2020

### Comment L4.1

The transit paragraphs describing Route 24 are out of date and no longer needed. Please update as appropriate.

Please use the following language to describe Route 123:

“In February 2020, OCTA combined Route 24 with Route 21 to become the new Route 123. When east of the Buena Park Metrolink Station, Route 123 travels predominantly down Malvern Avenue and Chapman Avenue past CSUF using the old Route 24 routing and terminates at the Anaheim Canyon Metrolink Station instead of the Village of Orange in the east. When traveling west of the Buena Park Metrolink Station, it uses the old Route 21 alignment on Valley View Boulevard and terminates at the Golden West Transportation Center in Huntington Beach. Route 123 continues to have approximately one-hour headways between 5:30 a.m. and 9:00 p.m. on weekdays. This route does not operate on weekends.”

### Response L4.1

The comment states that the description of Route 24 is out of date and provides language to describe a new route, Route 123, that was added in February. The comment also references the description of OCTA public transit service near the CSUF campus provided in the Transportation Impact Study (TIS) and page 4.11-4 of Section 4.11, *Transportation*, of the Draft EIR.

Page 4.11-4 of Section 4.11, *Transportation*, and page 7 of Appendix M, *Traffic Impact Analysis*, are revised as follows:

The TIS (Appendix M) provides a list of all OCTA bus routes that run within two miles of CSUF. OCTA Routes ~~24~~, 26, 57, 123, 153, and 213 all serve the CSUF campus (CSUF 2019a). Starting in 2020, Route 57 will run every 12 to 13 minutes along with Route 57x which will come approximately every 16<sup>th</sup> minute and 32<sup>nd</sup> minute of the hour (OCTA 2020). These lines operate from 6:00 a.m. to 6:00 p.m. Monday through Friday. Route 213 runs every 20 minutes and runs only during peak traffic hours. Route 153 services 42 stops with frequencies varying and runs from 7:00 a.m. to 7:00 p.m. OCTA bus routes, frequencies and headways change often due to merging bus routes and the addition/elimination of bus services.

In February 2020, OCTA combined Route 24 with Route 21 to become the new Route 123. When east of the Buena Park Metrolink Station, Route 123 travels predominantly down Malvern Avenue and Chapman Avenue past CSUF using the old Route 24 routing and terminates at the Anaheim Canyon Metrolink Station instead of the Village of Orange in the east. When traveling west of the Buena Park Metrolink Station, it uses the old Route 21 alignment on Valley View Boulevard and terminates at the Golden West Transportation Center in Huntington Beach. Route 123 continues to have approximately one-hour headways between 5:30 a.m. and 9:00 p.m. on weekdays. This route does not operate on weekends.

## Comment L4.2

The last bullet located on page 4.11-4 of the DEIR, Stop ID 1864 should be updated since it is now served by Route 123 instead of Route 24.

## Response L4.2

The comment references the description of OCTA public transit service near the CSUF campus provided on page 4.11-4 Draft EIR Section 4.11, *Transportation*.

Page 4.11-5 of Section 4.11, *Transportation*, is revised as follows:

CSUF offers discounted OCTA bus passes to students, faculty, and staff to encourage bus use. The following is a listing of existing bus stops along the perimeter of the CSUF campus and the routes that serve the stops:

- Yorba Linda-Campus (OCTA Stop ID 7879), located near the southeast corner of the Yorba Linda Boulevard and Associated Road/Campus Drive intersection on the north end of campus, served by Route 153 (Brea to Anaheim).
- State College-Corporation (OCTA Stop ID 1934), located along the east side of North State College Boulevard just north of the North State College Boulevard and Ranch Road/Corporation Drive intersection, served by Routes 57 and 57x (Brea to Newport Beach).
- State College-Campus (OCTA Stop ID 1933), located along the east side of North State College Boulevard just north of the North State College Boulevard and Dorothy Land intersection, served by Routes 57 and 57x.
- State College-Nutwood (OCTA Stop ID 1932), located along the east side of North State College Boulevard just north of the North State College Boulevard and Nutwood Avenue intersection, served by Routes 57 and 57x.
- Nutwood-Commonwealth (OCTA Stop ID 1864), located along the north side of Nutwood Avenue at the intersection of Nutwood Avenue and Commonwealth Avenue, served by Route ~~24~~ 123 (Buena Park to Orange).

Page 7 of Appendix M, *Traffic Impact Analysis*, is revised to refer to Route 123.

## Comment L4.3

Section 4.11 “Transportation”, and Appendix M “Traffic Impact Analysis” do not address impacts to the Congestion Management Program (CMP) Highway System (HS). While the California Environmental Quality Act (CEQA) now uses vehicle miles traveled to identify transportation impacts, OCTA still requires level of service analysis to monitor CMP Highway System performance.

## Response L4.3

The comment states that the Draft EIR and TIS do not address impacts to the Congestion Management Program (CMP) Highway System. Fehr & Peers reviewed the government code related to CMPs ([http://leginfo.legislature.ca.gov/faces/codes\\_displaySection.xhtml?sectionNum=65088.1.&lawCode=GOV](http://leginfo.legislature.ca.gov/faces/codes_displaySection.xhtml?sectionNum=65088.1.&lawCode=GOV)).

The government code states the following:

- [CMP is] (4) A program to analyze the impacts of land use decisions made by local jurisdictions on regional transportation systems, including an estimate of the costs associated with mitigating those impacts. This program shall measure, to the extent possible, the impact to the transportation system using the performance measures described in paragraph (2). In no case shall the program include an estimate of the costs of mitigating the impacts of interregional travel. The program shall provide credit for local public and private contributions to improvements to regional transportation systems. However, in the case of toll road facilities, credit shall only be allowed for local public and private contributions which are unreimbursed from toll revenues or other state or federal sources. The agency shall calculate the amount of the credit to be provided. The program defined under this section may require implementation through the requirements and analysis of the California Environmental Quality Act, in order to avoid duplication.
- [Definition of a Local Jurisdiction] (h) “Local jurisdiction” means a city, a county, or a city and county.

As noted in the comment, VMT is required under CEQA and LOS is no longer required. However, the definitions above indicate that CMP assessment is required for development in local jurisdictions, and it is clear that local jurisdictions are defined as a City, County, or City and County. Given that CSUF does not meet the definition of a local jurisdiction, it would not be subject to CMP requirements and no CMP analysis would be required.

#### Comment L4.4

The CMP analysis can be provided to OCTA separately from the CEQA document. We would request this analysis be performed and provided to OCTA as soon as feasible. Please refer to Appendix B-1: Meeting CMP Traffic Impact Analysis Requirements and Appendix B-2: Traffic Impact Analysis Exempt Projects in the 2019 CMP Report available here:  
<http://www.octa.net/pdf/2019CMP.pdf?n=201911>

Please note that State College Boulevard and Orangethorpe Avenue are part of the CMP Highway System. Additionally, the State College Boulevard/Orangethorpe Avenue and State College Boulevard/State Route 91 ramp intersections are CMP intersections. These roadways and intersections should be analyzed as such for any potential traffic impacts consistent with the Orange County CMP.

#### Response L4.4

The comment states that a CMP analysis should be prepared and can be provided separately to OCTA.

Please see Response L4.4, above. No additional response is required.

#### Comment L4.5

Attachment M, Traffic Impact Study, Roadway Network, pages 2-3 do not accurately describe the following roadways:

- Associated Road is described as a secondary arterial with four undivided travel lanes. Though the classification is correct, Associated Road is currently built as a four-lane, divided roadway north of Yorba Linda Boulevard.

- Bastanchury Road is described as a major arterial with five divided travel lanes. Though the classification is correct, Bastanchury Road is built as a four- to five-lane, divided roadway between State College Blvd and State Route 57.
- Bradford Avenue is described as a local street collector with two undivided travel lanes. According to the City of Fullerton's (City) Circulation Element and the MPAH, Bradford Avenue is classified as a secondary arterial. Additionally, Bradford Avenue is built as a two-lane, undivided to a four-lane, undivided roadway.
- Chapman Avenue is described as a major arterial between State College and Placentia Avenue with six divided travel lanes and a primary west of State College Boulevard with four divided travel lanes. The classification is correct; however, Chapman Avenue is built as a five-lane, divided roadway between State College and Placentia Avenue.
- Commonwealth Avenue is described as a primary arterial highway with four undivided travel lanes. Commonwealth Avenue between Nutwood Avenue and Chapman Avenue is classified as a major arterial in the City's General Plan and a primary arterial in the MPAH. Commonwealth Avenue south of Chapman Avenue is classified as a primary arterial in both the City's General Plan and the MPAH. Additionally, Commonwealth Avenue between State College and Chapman Avenue is built as a two-lane divided roadway with bike lanes.
- Nutwood Avenue is described as a primary arterial with six lane divided travel lanes. The classification is correct; however, Nutwood Avenue between Placentia Avenue to Commonwealth Avenue is built as a four- to five-lane divided roadway.

## Response L4.5

The character and number of lanes on roadways varies along the corridors for the roadways described in the draft EIR. The Draft EIR adequately describes most of the roadways around the campus area.

Appendix M, *Traffic Impact Analysis*, is revised as follows:

**Bastanchury Road** is classified as a Major Arterial Highway with ~~four- to five~~ five divided travel lanes north of the Project site. It provides east-west mobility and connects to roadways with direct access to the Project site. The posted speed limit is 50 MPH.

**Bradford Avenue** is classified as a Secondary Arterial ~~Local Street Collector~~ with two undivided travel lanes east of the Project site. It provides north-south mobility and connects to roadways with direct access to the Project site. The posted speed limit is 35 MPH.

**Chapman Avenue** is classified as a Major Arterial Highway east of State College Boulevard with ~~six~~ five divided travel lanes and classified as a Primary Arterial Highway west of State College Boulevard with four divided travel lanes. It lies southwest of the Project site, providing east-west mobility and connection to roadways with direct access to the Project site. The posted speed limit is 40 MPH.

**Commonwealth Avenue** is classified as a Primary Arterial Highway with four undivided travel lanes west of State College Blvd. Between State College Boulevard and Nutwood Avenue it provides two- to four divided travel lanes. ~~southwest of the Project site.~~ It provides east-west mobility and connects to roadways with direct access to the Project site. The posted speed limit is 40 MPH.

The changes made to the Final EIR and Appendix M, *Traffic Impact Analysis*, do not raise any environmental issues related to the adequacy of the EIR analysis.

## Letter I1

**COMMENTER:** Bill Sampson

**DATE:** May 6, 2020

### Comment I1.1

I was reading through the various chapters in this EIR, and I noticed that on several of the renderings, the Orange Freeway is listed as highway 56; it is actually highway 57.

### Response I1.1

The commenter states that several exhibits throughout the Draft EIR incorrectly refer to the Orange Freeway as SR 56.

The figures contained in the Final EIR have been revised to refer to SR 57.

**To:** Zordilla, Emil <[ezordilla@Fullerton.edu](mailto:ezordilla@Fullerton.edu)>  
**Cc:** Savant, Katie [REDACTED]  
**Subject:** CMP Draft EIR

Hi Katie and Emil,

In the Draft EIR for the CMP , Section 7.4.3 has some Friends concerned. As I read it I too am having a hard time understanding the locations and encroachments. Can you help me help others understand?

Greg

" Because of the presence of SR 57 to the west, it is conceivable that additional student housing in this part of campus could result in the elimination of the parking facility to the south or encroachment into the Arboretum to the north and west. The building cluster intended for staff and faculty housing would not change compared to the Campus Master Plan. CSUF has a high percentage of students that commute to classes as opposed to living on campus (<10 percent). The increase in housing would increase the percentage of students living on campus from approximately 8 percent to 25 percent, even accounting for an increase in the FTES from 25,000 to 32,000."

I2.1

## Letter I2

**COMMENTER:** Gregory Dymont, CSUF

**DATE:** June 1, 2020

### Comment I2.1

In the Draft EIR for the CMP, Section 7.4.3 has some Friends concerned. As I read it I too am having a hard time understanding the locations and encroachments. Can you help me help others understand?

“Because of the presence of SR 57 to the west, it is conceivable that additional student housing in this part of campus could result in the elimination of the parking facility to the south or encroachment into the Arboretum to the north and west. The building cluster intended for staff and faculty housing would not change compared to the Campus Master Plan. CSUF has a high percentage of students that commute to classes as opposed to living on campus (<10 percent). The increase in housing would increase the percentage of students living on campus from approximately 8 percent to 25 percent, even accounting for an increase in the FTES from 25,000 to 32,000”.

### Response I2.1

The commenter expresses difficulty understanding how Alternative 3 (Increased Student Housing) would encroach into the Fullerton Arboretum, and quotes text from Chapter 7, Alternatives.

As stated in Chapter 7, *Alternatives*, CEQA requires an EIR to describe a reasonable range of alternatives to a project or to the location of a project that feasibly attains most of the project’s basic objectives but avoids or substantially lessens any of the project’s significant environmental impacts. The alternatives presented in Chapter 7 of the Draft EIR were developed in compliance with the CEQA Guidelines, which stipulate that sufficient information must be provided to allow for meaningful evaluation, analysis, and comparison with the impacts of the proposed project. The major characteristics and significant environmental effects of each alternative have been provided in compliance with Section 15126.6(d); however, alternatives were not developed or analyzed in the same level of detail as the Campus Master Plan, as CEQA does not require that. Therefore, the precise location of additional student housing was not determined in the EIR; the passage quoted by the commenter reflects the fact that SR 57 lies to the east (not west, as was stated in the Draft EIR) of the existing student housing along the campus’s eastern edge, and therefore expansion of housing in this area could only be realized if permitted to encroach into the Arboretum to the north and west. Statements regarding such potential encroachment into the Arboretum were speculative in nature and intended to communicate the environmental impact of adding new student residential buildings in this part of the campus.

**To:** Campus Master Plan <[campusmasterplan@Fullerton.edu](mailto:campusmasterplan@Fullerton.edu)>  
**Subject:** Master Plan feedback from the web

Hello,

A user has sent feedback in regards to the Campus Master Plan.

Comments: Being a local resident to the campus I am very concerned about the Campus Master Plan and wanted to write to you since the report was published but could not due to my health issues and lockdown. First and foremost, I request to add more time to the review period due to lockdown. I am 85 years old and a neighbor who has seen this campus grow for last 30 years and feel that the now the campus has big impact on my living here. From air quality, congestion, traffic, and parking is a nightmare for me and other neighbors and I have been noticing that the campus does not want to hear me and other neighbors. As I discuss this issue with my neighbors and they say, it's no point to raise the issue as City, County, Caltrans, other public agencies, and local shopping areas would not allow us to be heard due to economic impact of the campus. But I will raise some questions by my-self and expect honest answers. I understand the need to expand but CSU should look into adding more campuses so they can plan them well. This campus is for me has reached it maximum potential and should be maintained to current levels. Due to my week eye-sight I have to use big lenses to read, therefore it's another reason to extend the review period. I know it needs to be 45 days but that is minimum and strongly recommend campus to extend the review period. My comments are in relation to the traffic impact. FEHR & PEERS traffic report is not correct. I am going to give you just couple of items that would need more information: 1) Table 1: 2019 Master Plan Students, Employees, and Housing Growth Forecasts is not correct. It shows 2019 Baseline No Project student count to 25,000 which not correct per your website, which shows a total count of 42,000 students and 25,000 as full time equivalent (FTE). Also, when I called the Housing office at the campus they said they about 2,000 beds when I insisted they for an accurate number they said it is somewhere between 2025 to 2040 but not 2,829. Both of these items change the forecast substantially and CEQA mitigation would be required. 2) Traffic Volumes in Appendix A are not taken at the right time or they are taken at right time, intentionally to pick low volumes. All of us that the big traffic time is from the 3rd week of August to about 3rd week of September where the traffic delays are so bad through out the day that for last couple of years I don't even drive during that time. Conveniently, traffic volumes are taken after peak traffic days and just for few selected days to justify the CEQA exercise. I am hoping to bring other items, if you extend the review period but due to time constrains I have laid out just two major points. Being a good neighbor, I want to see this University flourish and be on top but with factual data and analysis. Please respond to my concerns. I will be sending a copy to the President's Office, City Mayor, and other members of community. Thanks, and looking forward to hear from you. Sincerely, A concerned citizen Kevin Yaldezian [REDACTED]  
Rd, Fullerton, CA, 92831

## Letter I3

**COMMENTER:** Kevin Yaldezian

**DATE:** June 19, 2020

### Comment I3.1

Being a local resident to the campus I am very concerned about the Campus Master Plan and wanted to write to you since the report was published but could not due to my health issues and lockdown. First and foremost, I request to add more time to the review period due to lockdown. I am 85 years old and a neighbor who has seen this campus grow for last 30 years and feel that the now the campus has big impact on my living here. From air quality, congestion, traffic, and parking is a nightmare for me and other neighbors and I have been noticing that the campus does not want to hear me and other neighbors. As I discuss this issue with my neighbors and they say, it's no point to raise the issue as City, County, Caltrans, other public agencies, and local shopping areas would not allow us to be heard due to economic impact of the campus. But I will raise some questions by my-self and expect honest answers.

### Response I3.1

The comment states that the commenter was unable to respond in a timely manner due to health issues and the COVID-19 statewide shelter-in-place order, and requests additional review time. It should be noted that this comment letter was received after the close of the public comment period. The comment is nonetheless included in the record for consideration by the decision makers.

While CSUF understands that the timing of the public review may have been challenging for some due to statewide shelter in place orders, the campus has complied with CEQA Guidelines for review. In accordance with Section 15105 of the CEQA Guidelines, a Draft EIR is required to be available for review for a period of no less than 45 calendar days. With more than six weeks to review, it is reasonable to assume that interested parties were able to find an adequate window of time to review and comment. During the review period, the Draft EIR was available on the CSUF website for review, and a limited number of flash drives containing the Draft EIR and hardcopies of Volume I of the Draft EIR were made available for mailing to interested members of the public who were unable to access the Draft EIR online. A Public Meeting Presentation was posted to the CSUF website in lieu of an in person public meeting typically held to review the findings of the Draft EIR. A notice regarding the availability of the Draft EIR was sent via email to a list of stakeholders, local jurisdictions, and members of the general public who had asked to be notified about the project or had made comments during the EIR scoping period (August 30 – October 3, 2019). The EIR scoping period was noticed publicly in the OC Register on May 6, 2020, in accordance with CEQA Guidelines.

CSUF has been engaged in its Master Plan process for over two years, during which time three open house/informational sessions were held to solicit the input of stakeholders and interested parties, including the campus community, in May 2018, April 2019, and May 2019. Additional meetings were held with CSUF staff and community stakeholders to gather more in-depth input on important master planning topics, such as circulation and the Arboretum. An Executive Task Force made up of CSUF and CSU staff from all university divisions and all colleges, and representatives from the

Associated Students Inc. Board and University Union Advisory Board, and Academic Senate Leadership, has also been meeting over the past two years.

### Comment I3.2

I understand the need to expand but CSU should look into adding more campuses so they can plan them well. This campus is for me has reached it maximum potential and should be maintained to current levels.

### Response I3.2

The comment states that additional campuses should be added to the CSU system, and that the CSUF campus appears to have reached its maximum potential. The development of additional CSU campuses is not the subject of this environmental review.

The Draft EIR does address the need and desire to expand enrollment numbers on the CSUF campus and CSU policies governing this growth. As the demand for higher education has increased, so have CSU systemwide enrollment numbers. As detailed in Section 2.3, *Project Description*, the last ten years have displayed exponential growth for CSUF, averaging an increase of 1.2 percent annually with some years, like 2012, reaching five percent. Many of the current facilities on campus have not kept up with growth levels and are now inadequate; the condition and state of infrastructure amongst many of the facilities are overdue for renovations and improvements. The Campus Master Plan provides a framework for managing future campus growth and change in a strategic and orderly way, accomplishing one of the project objectives presented in Section 2.3.

Growth across all CSU campuses is planned for well in advance. As stated in Section 2.3, *Project Description*, the CSU Board of Trustees requires each CSU campus to have a Campus Master Plan which depicts and explains existing and anticipated facilities necessary to accommodate a specific enrollment target at an estimated target date or planning horizon, in accordance with approved education policies and objectives. CSU negotiates with the State of California annually for funding to support enrollment increases, and each campus is expected to manage enrollment rates within a small margin of error around target enrollment rates set by the CSU Board of Trustees. The Campus Master Plan sets a new enrollment target of 32,000 FTES, and accounts for future campus development required through the year 2039 to accommodate this enrollment target.

### Comment I3.3

Due to my week [*sic*] eye-sight I have to use big lenses to read, therefore it's another reason to extend the review period. I know it needs to be 45 days but that is minimum and strongly recommend campus to extend the review period.

### Response I3.3

The comment requests extension of the Draft EIR review period as an accommodation. Please see Response I3.1, which outlines how the campus has complied with the CEQA Guidelines for public review of the Draft EIR.

### Comment I3.4

My comments are in relation to the traffic impact. FEHR & PEERS traffic report is not correct. I am going to give you just couple of items that would need more information: 1) Table 1: 2019 Master Plan Students, Employees, and Housing Growth Forecasts is not correct. It shows 2019 Baseline No Project student count to 25,000 which not correct per your website, which shows a total count of 42,000 students and 25,000 as full time equivalent (FTE). Also, when I called the Housing office at the campus they said they about 2,000 beds when I insisted they for an accurate number they said it is somewhere between 2025 to 2040 but not 2,829. Both of these items change the forecast substantially and CEQA mitigation would be required. 2) Traffic Volumes in Appendix A are not taken at the right time or they are taken at right time, intentionally to pick low volumes. All of us know that the big traffic time is from the 3rd week of August to about 3rd week of September where the traffic delays are so bad throughout the day that for last couple of years I don't even drive during that time. Conveniently, traffic volumes are taken after peak traffic days and just for few selected days to justify the CEQA exercise. I am hoping to bring other items, if you extend the review period but due to time constraints I have laid out just two major points.

### Response I3.4

The comment states concerns with the data and analysis contained in Appendix M, *Traffic Impact Analysis*, and misinformation provided by the CSUF Housing Office.

The 2019 Baseline No Project student count provided in the *Traffic Impact Analysis*, is correct. The 25,000 students assumed under this scenario does in fact refer to 25,000 FTES, a number apparently obtained by the commenter from the CSUF website. The analysis contained in the *Traffic Impact Analysis* does accurately capture the 3,000 new on-campus beds detailed in the Campus Master Plan. The detailed environmental analysis presented in Section 4.11 of the Draft EIR, *Transportation*, relies on the *Traffic Impact Analysis*. It should be noted that CEQA now relies on VMT as the approved metric to identify transportation impacts. VMT is a measure of the number and length of project-related trips. Previously, CEQA relied on level of service (LOS), an analysis of congestion at intersections and on roadway segments, to determine project-related impacts. LOS is no longer considered a CEQA impact. The VMT analysis contained in the *Traffic Impact Analysis*, found that transportation impacts due to the Campus Master Plan were less than significant, and no mitigation was required.

Traffic counts utilized in the *Traffic Impact Analysis* were taken on September 24-25, 2019, a Tuesday and a Wednesday. The counts were taken throughout the day, during a time when all area schools were in session, to obtain an accurate snapshot of existing conditions. The OCTAM model was utilized to evaluate the impacts of the Campus Master Plan, and the traffic volume due to the addition of 4,000 commuter students, 3,000 resident students, and 1,000 employees was established by running a Select Zone Analysis in the travel demand model. This approach follows established methodology and no changes to the *Traffic Impact Analysis* are required due to this comment.

As stated on page 2-23 of Section 2, *Project Description*, the Campus Master Plan accommodates and additional 3,000 student beds and a range of residential options and associated amenities on campus, to support improved rates of retention and graduation for freshman and other students. As noted in Response L1.13, there was some confusion regarding the number of student beds proposed in the Campus Master Plan as both 3,000 and 2,400 beds were presented. To clarify, approximately 600 of the proposed 3,000 student housing beds were evaluated under the 2003

Master Plan and are the subject of separate environmental review. These beds are included in this discussion as they have not yet been constructed and are a part of the projected 3,000 additional student beds accommodated under the Campus Master Plan. Refer to Response L1.13 for further discussion of this topic.

### **Comment I3.5**

Being a good neighbor, I want to see this University flourish and be on top but with factual data and analysis. Please respond to my concerns. I will be sending a copy to the President's Office, City Mayor, and other members of community. Thanks, and looking forward to hear [*sic*] from you.

### **Response I3.5**

The comment states that a copy of these comments will be sent to community stakeholders and decision makers, and that a response is expected.

Written responses have been prepared to address all comments received on the Draft EIR during the public comment period, and are contained herein, in conformance with Section 15088(a) of the CEQA Guidelines. As required by CEQA Section 21092.5 and CEQA Guidelines Section 15088(b), at least 10 days before consideration of the Final EIR for certification, CSUF provided a written response (electronic copy) to each public agency that submitted written comments on the Draft EIR.

The comment does not raise any environmental issues related to the adequacy of the EIR analysis, and no further response is required. The comment is included within the record for consideration by the decision makers as part of the Campus Master Plan approval process.

# Executive Summary

---

This Executive Summary is provided in accordance with the California Environmental Quality Act (CEQA) Guidelines Section 15123. It contains an overview of the programmatic analysis of the California State University, Fullerton, (CSUF) Physical Master Plan (Campus Master Plan). As stated in the State CEQA Guidelines Section 15123(a), “[a]n EIR shall contain a brief summary of the proposed actions and its consequences. The language of the summary should be as clear and simple as reasonably practical.” CEQA Guidelines Section 15123(b) states, “[t]he summary shall identify: (1) each significant effect with proposed mitigation measures and alternatives that would reduce or avoid that effect; (2) areas of controversy known to the Lead Agency, including issues raised by agencies and the public; and (3) issues to be resolved including the choice among alternatives and whether or how to mitigate the significant effects.” Accordingly, this summary includes a brief synopsis of the Campus Master Plan and identified plan alternatives, environmental impacts and mitigation, areas of known controversy, and issues to be resolved during environmental review. Table ES-3 (at the end of this section) summarizes potential environmental impacts from implementation of the Campus Master Plan, mitigation measures that could reduce significant impacts, and the levels of significance following the implementation of mitigation measures.

## Project Synopsis

This EIR has been prepared to examine the potential environmental effects of the Campus Master Plan. The following is a summary of the full project description, which can be found in Section 2.0, *Project Description*.

### Project Location

The project site is the campus of CSUF, which is located at 800 North State College Boulevard in the City of Fullerton, Orange County, California. The campus is bounded by Yorba Linda Boulevard to the north, Nutwood Avenue to the south, State Route 57 (SR 57) (the Orange Freeway) to the east, and North State College Boulevard to the west. Three smaller areas are also part of the campus immediately to the north, south, and west of the main campus. The campus is located in the northern portion of Orange County and in the eastern portion of the City of Fullerton, about 1,000 feet west of the Placentia city limit, two miles northeast of downtown Fullerton, and 3.25 miles northeast of downtown Anaheim. The campus encompasses approximately 240 acres. The area surrounding the campus is developed with residential uses, educational institutions, and mixed commercial uses. The campus is bisected by Gymnasium Campus Drive and is characterized by a central core of academic buildings in its southern half, with athletic facilities, residential housing, the Fullerton Arboretum, and parking areas located primarily in the northern portion of the campus.

### Background and Project Need

The original CSUF campus was founded in 1957 and officially became part of the California State University (CSU) system in June 1972 (CSUF 2017). Today, CSUF is the second largest university in the CSU system (CSU 2019) with total full-time equivalency students (FTES) increasing from 25,000 to 32,000 by 2039 at an increasing rate of one percent annually. The footprint of the university has expanded over time to accommodate an exponential increase in student enrollment, with several

facilities developed in the last decade. The 2003 Master Plan, currently in effect, is now outdated and inadequate for the university's growing student enrollment. The Campus Master Plan provides a framework for managing future campus growth and needs, as well as the campus's relationship with the City.

Many of the current facilities on campus are overdue for renovations and improvements to fit the needs of the growing campus population. The Campus Master Plan will provide a guideline for improving existing facilities and guiding new construction through 2040, including the improvement of recreational facilities and academic buildings, the addition of on campus housing, and improvement of multi-modal circulation. Through gradual phased development, the goal of the Campus Master Plan is to create an enjoyable experience for students, staff, and visitors.

## Project Goals and Objectives

The Campus Master Plan focuses on CSUF's commitment to student success while guiding the physical growth on campus needed to accommodate an expanding and thriving campus population. CSUF's commitment to its students is underlined in the Campus Master Plan through the inclusion of the following overarching goals:

- Serve the future of society by providing a robust and relevant education.
- Improve graduation rates.
- Support problem-based learning.
- Promote research as learning and basic research as vital components of this knowledge-based community.
- Promote cross discipline collaboration.
- Increase quality student/professional interaction.
- Build community connection and support.

To accomplish these goals, the Campus Master Plan presents strategies that balance programmatic and behavioral needs with the physical identify for the campus and its built environment, to educate a future student enrollment of 32,000 FTES. The following project objectives have been established in support of the larger goals:

- Enable the university to accommodate incremental planned enrollment growth in the future as required by the CSU.
- Construct new academic facilities that can house programs to fulfill the pedagogic needs of the future and contribute to meeting demand created by planned enrollment growth.
- Improve the connectivity and cohesion of physical spaces on campus and with improved linkages to Downtown Fullerton and public transit.
- Enable the campus to function as a 24-hour hub for student life through increased building density with amenities and access to goods and services in the campus core, the addition of student beds, informal and after-hours work spaces for students, and improved nighttime security.
- Restore the Green Loop that circumnavigates the campus to better function as an organizing feature for academic facilities and open space.
- Increase the density of academic facilities in the campus core to support program growth and change and enable cross-disciplinary collaboration in a space-efficient manner.

- Develop an Innovation Hub that allows students to experiment with processes and prototypes for the future, to serve all sectors of society.
- Establish an event center on campus for daily use by the entire campus community.
- As the campus resumes primary responsibility for management of the Arboretum, balance preservation of its natural and historic resources, protection of its function as a place of solitude and reflection for campus and community members, and enhancement of its use for academic purposes.
- Provide an additional 2,400 student beds and a range of residential options and associated amenities on campus, to support improved rates of retention and graduation for freshman and other students.
- Provide 350 units of faculty housing.
- Improve alternative, multimodal access to campus and reduce reliance on personal vehicle use and parking demand.
- Replace and improve storm management infrastructure to reduce the incidence of flooding.
- Incorporate resilience into the Campus Master Plan through emergency management planning and established locations for emergency operation centers and material storage.

## Project Characteristics

Development under the Campus Master Plan would include approximately 3,000 new student beds (600 of which are part of a separate project not included in the Campus Master Plan and are not analyzed in this EIR), and 350 residential units for faculty/staff. This equates to approximately 803,880 gross square feet (gsf) of new residential housing and 539,000 gsf of faculty/staff housing. In addition, the Campus Master Plan would add approximately 881,526 gsf of academic administrative and support space, 40,000 gsf of non-academic support space, two additional parking structures totaling approximately 1,677,374 gsf, and a 6,000-seat event center. A full description of all components included in the Campus Master Plan is included in Section 2, *Project Description*.

## Alternatives

CEQA Guidelines Section 15126.6, as amended, mandates that all EIRs include a comparative evaluation of the proposed plan with alternatives to the plan that can attain most of the plan's basic objectives but would avoid or substantially lessen any of the significant effects of the plan. CEQA requires an evaluation of a "range of reasonable" alternatives, including the "no project" alternative. The following provides brief descriptions of the alternatives evaluated in this EIR.

- Alternative 1: No Project – No Development
- Alternative 2: Reduced Enrollment and Academic Space
- Alternative 3: Increased Student Housing

**Alternative 1 (No Project)** would continue implementation of the 2003 Master Plan. Planned development as expressed in the 2003 Master Plan, primarily new academic/administrative space, would continue up to its planned capacity. This alternative would assume the same student growth rate as projected in the Campus Master Plan.

**Alternative 2 (Reduced Academic Space Alternative)** would not alter the components of the Campus Master Plan, except for a 25 percent reduction in square footage of constructed academic space.

**Alternative 3 (Increased Student Housing Alternative)** would not alter the components of the Campus Master Plan but would double the number of planned student beds from 3,000 to 6,000. The additional 3,000 beds would be implemented by increasing the number of floors in three of the housing clusters. The number of proposed staff/faculty housing units would remain the same as the Campus Master Plan.

Based on the analysis discussed in Section 6.0, *Alternatives*, in this EIR, Alternative 1 (No Project-No Development) would result in the fewest potential environmental impacts and is considered the environmentally superior alternative. As required by the CEQA Guidelines (California Code of Regulations Section 15126.6 [e][2]), because the environmentally superior alternative was identified as the No Project Alternative, another environmentally superior alternative must be identified among the other alternatives considered. Alternatives 2 and 3 would result in environmental effects, of varying degrees of severity in relation to those of the Campus Master Plan. The environmental impact differences between these two alternatives are not substantial enough that one is clearly superior to the other.

## Areas of Known Controversy

CSUF circulated a Notice of Preparation (NOP) of the EIR for a 30-day agency and public review period starting on August 30, 2019 and ending on October 3, 2019. CSUF distributed the NOP to the State Clearinghouse, responsible agencies, and other interested parties. CSUF held an EIR Public Scoping Meeting on September 19, 2019, to provide information about the Campus Master Plan and the CEQA process to members of public agencies, interested stakeholders, and residents/community members.

CSUF received comments during the Public Scoping Meeting, via email, and letters from four public agencies. Appendices A and B of this EIR present the NOP and all comments received during the 30-day review period. Information on how each comment is addressed in the EIR is summarized in Section 1.0, *Introduction*.

Comments focused on the following areas of concern:

- Traffic congestion on local streets and SR 57
- Multi-modal transportation planning and accommodations
- Transportation connections to/from campus
- Lack of on-campus parking and impacts on nearby residential streets
- Age/deterioration of campus buildings
- Water conservation
- Lack of shade on campus
- Removal of existing trees to facilitate development
- Heat island effect (rising outdoor temperature due to increasing building density and impervious surfaces)
- Impact of the Event Center on nearby residential neighborhoods
- Prioritization of student housing

- Planning for utility upgrades to serve increased number of students
- Access to campus facilities for aging population and those with mobility issues

## Summary of Impacts and Mitigation Measures

Table ES-1 the environmental impacts of the Campus Master Plan, mitigation measures, and residual impacts (the impact after application of mitigation, if required). Impacts are categorized as follows:

- **Significant and Unavoidable.** An impact that cannot be reduced to below the threshold level given reasonably available and feasible mitigation measures. Such an impact requires a Statement of Overriding Considerations to be issued if the Campus Master Plan is approved, per Section 15093 of the CEQA Guidelines.
- **Less than Significant with Mitigation Incorporated.** An impact that can be reduced to below the threshold level given reasonably available and feasible mitigation measures. Such an impact requires findings under Section 15091 of the CEQA Guidelines.
- **Less than Significant.** An impact that may be adverse but does not exceed the threshold level and does not require mitigation measures. However, mitigation measures that could further lessen the adverse environmental effect may be suggested if readily available and easily achievable.
- **No Impact:** The Campus Master Plan would have no effect on environmental conditions or would reduce existing environmental problems or hazards.

Table ES-1 Summary of Environmental Impacts, Mitigation Measures, and Residual Impacts

Impact	Mitigation Measure (s)	Residual Impact
<b>Aesthetics</b>		
<b>Impact AES-1.</b> Development of the Campus Master Plan would alter the visual character of the vacant subject site by introducing a cluster of multi-story buildings that differ from the suburban, industrial, and commercial forms on adjacent parcels. While the change would be substantial, the existing visual character and quality of the site and its surroundings would not be substantially degraded because of Campus Master Plan implementation. The proposed buildings and landscaping would adhere to the City’s design guidelines and contribute to the city policies related to aesthetics, bringing about an improvement to existing unmaintained parcels. Impacts would be less than significant.	None required.	Less than significant.

Impact	Mitigation Measure (s)	Residual Impact
<p><b>Impact AES-2.</b> Development of the Campus Master Plan would not substantially damage scenic resources, including but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway.</p>	<p>None required.</p>	<p>Less than significant.</p>
<p><b>Impact AES-3.</b> Development of the Campus Master Plan would not substantially degrade the existing visual character or quality of public views of the site and its surroundings. Additionally, the Campus Master Plan would not conflict with applicable zoning and other regulations governing scenic quality?</p>	<p>None required.</p>	<p>Less Than significant.</p>
<p><b>Agriculture and Forestry</b></p>		
<p><b>Impact AGR-1.</b> The Campus Master Plan would not convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use. The campus does not contain Farmland, Unique Farmland, or Farmland of Statewide Importance.</p>	<p>None required.</p>	<p>No Impact.</p>
<p><b>Impact AGR-2.</b> Development of the Campus Master Plan would not conflict with existing zoning for agricultural use or a Williamson Act contract. There are no active Williamson Act contracts associated with the campus.</p>	<p>None required.</p>	<p>No impact.</p>
<p><b>Impact AGR-3.</b> The Campus Master Plan would not conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code Section 12220(g)); timberland (as defined by Public Resources Code Section 4526); or timberland zoned Timberland Production (as defined by Government Code Section 51104(g).</p>	<p>None required.</p>	<p>No impact.</p>

Impact	Mitigation Measure (s)	Residual Impact
<p><b>Impact AGR-4.</b> Development of the Campus Master Plan would not result in the loss of forest land or conversion of forest land to non-forest use.</p>	<p>None required.</p>	<p>No impact.</p>
<p><b>Impact AGR-5.</b> The Campus Master Plan does not involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural use or conversion of forest land to non-forest use.</p>	<p>None required.</p>	<p>No impact.</p>
<p><b>Air Quality</b></p>		
<p><b>Impact AQ-1.</b> Implementation of the Campus Master Plan would not generate population, housing, or employment growth exceeding forecasts used in the development of the 2016 AQMP. However, operation would exceed the SCAQMD thresholds for ozone precursors (ROG and NO<sub>x</sub>) that the AQMP provides strategies and measures to reach attainment with. With implementation of mitigation measures, the Campus Master Plan would still exceed SCAQMD thresholds for these pollutants. Therefore, impacts are significant and unavoidable.</p>	<p><u>See Mitigation Measure AQ-1 under Impact AQ-2.</u>  <b>AQ-1 Green Cleaning Production Education Program.</b>            CSUF shall develop a Green Cleaning Product education program to be made available at housing offices, educational areas, and/or on websites. The education program is intended for students and institutional consumers and consists of: (1) provision of educational materials in housing offices, educational areas, and/or on websites, about low ROG/VOC consumer products for planned housing and academic uses, (2) educational materials addressing the use of detergents; cleaning compounds; polishes; floor finishes; cosmetics; personal care products; home, lawn and garden products; disinfectants; sanitizers; aerosol paints; automotive specialty products; low ROG/VOC paints and architectural coatings; and low emission landscape equipment, and (3) Educational materials on the importance of recycling and purchasing recycled material.</p>	<p>With implementation of mitigation, operation would still exceed SCAQMD thresholds for ozone precursors (ROG and NO<sub>x</sub>). Therefore, the Campus Master Plan would result in significant and unavoidable impacts.</p>
<p><b>Impact AQ-2.</b> Construction would not generate pollutants in quantities that exceed SCAQMD significance thresholds. Operation would exceed SCAQMD thresholds for ROG and NO<sub>x</sub>. With implementation of mitigation, the Campus Master Plan would still exceed SCAQMD thresholds for these pollutants. Therefore, impacts are significant and unavoidable.</p>	<p><u>See Mitigation Measure AQ-2 under Impact AQ-1.</u>  <b>AQ-1 Green Cleaning Production Education Program.</b>  <u>CSUF shall develop a Green Cleaning Product education program to be made available at housing offices, educational areas, and/or on websites. The education program is intended for students and institutional consumers and consists of: (1) provision of educational materials in housing offices, educational areas, and/or on websites, about low ROG/VOC consumer products for planned housing and academic uses, (2) educational materials addressing the use of detergents; cleaning compounds; polishes; floor finishes; cosmetics;</u></p>	<p>Implementation of Mitigation Measure AQ-1 would provide educational information to residents of the campus to decrease their use of consumer products to benefit the air quality of the basin.</p>

Impact	Mitigation Measure (s)	Residual Impact
	<p><u>personal care products; home, lawn and garden products; disinfectants; sanitizers; aerosol paints; automotive specialty products; low ROG/VOC paints and architectural coatings; and low emission landscape equipment, and (3) Educational materials on the importance of recycling and purchasing recycled material.</u></p>	
<p><b>Impact AQ-3.</b> The Campus Master Plan would not expose sensitive receptors to substantial pollutant concentrations from CO Hotspots or TAC's.</p>	<p>None Required.</p>	<p>Less than significant.</p>
<p><b>Impact AQ-4.</b> The Campus Master Plan would not result in other emissions (such as those leading to odors) adversely affecting a substantial number of people. For construction activities, odors would be short-term in nature and are subject to SCAQMD Rule 402 <i>Nuisance</i> (SCAQMD 1976). Construction activities would be temporary and transitory and associated odors would cease upon construction completion.</p>	<p>None required.</p>	<p>Less than significant.</p>
<p><b>Biological Resources</b></p>		
<p><b>Impact Bio-1.</b> The Campus Master Plan would not have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service. No special-status plant or wildlife species were observed during the field reconnaissance survey.</p>	<p>None required.</p>	<p>Less than significant.</p>
<p><b>Impact Bio-2.</b> Development of the Campus Master Plan would not have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service.</p>	<p>None required.</p>	<p>Less than significant.</p>

Impact	Mitigation Measure (s)	Residual Impact
<p><b>Impact Bio-3.</b> Development of the Campus Master Plan would not have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.</p>	None required.	Less than significant.
<p><b>Impact Bio-4.</b> Development of the Campus Master Plan would not interfere with the migratory movement of any fish or wildlife species. The San Gabriel Mountains, located approximately 18 miles north of the CSUF campus, serves as the closest essential wildlife corridor connectivity area. A natural landscape block is located approximately three miles northeast of the campus in Chino Hills. Given the distance to these two areas, the campus does not serve as a migratory wildlife corridor and implementation of the Campus Master Plan would not substantially interfere with the movement of any native wildlife species. Reference Section 4.13 for further discussion.</p>	None required.	Less than significant.
<p><b>Impact Bio-5.</b> Implementation of the Campus Master Plan would not conflict with any local policies or ordinances protecting biological resources such as tree preservation. The Campus Master Plan states that a mature tree canopy would be maintained along the perimeter of campus to maintain a clear boundary between campus and neighboring residential areas and SR 57. Existing trees along the perimeter of campus would remain and additional trees would be planted where needed. If trees within the City's ROW are proposed to be altered in any way as part of the Campus Master Plan, a service request shall be submitted to the City of Fullerton Landscape Division. Reference Section 4.13 for further discussion.</p>	None required.	Less than significant.

Impact	Mitigation Measure (s)	Residual Impact
<p><b>Impact Bio-6.</b> The Campus Master Plan would not conflict with the provisions of an adopted Habitat Conservation Plan or Natural Community Conservation Plan. The City of Fullerton does not have jurisdiction over CSUF; however, CSUF considers aspects of local plans and policies for the communities surrounding the campus when it is appropriate and feasible, although it is not bound by those plans and policies in its planning efforts. The campus is not subject to any Habitat Conservation Plan, Natural Conservation Community Plan, or additional local, regional, or state habitat conservation plan. Reference Section 4.13 for further discussion.</p>	<p>None required.</p>	<p>Less than significant.</p>
<p><b>Cultural Resources</b></p>		
<p><b>Impact CUL-1.</b> Several historic resources are present on the CSUF campus and shall remain with implementation of the Campus Master Plan. Therefore, the Campus Master Plan would result in Less Than Significant Impacts with Mitigation Incorporated.</p>	<p><b>CUL-1 Complete Historic Resources Evaluation and Project-Specific Surveys Prior to Design Phase to Identify Historical Resources</b></p> <p>Before altering or otherwise affecting a building, structure, or designed landscape feature that is 45 years old or older, CSUF shall retain a historian or architectural historian who meets the Secretary of the Interior’s Professional Qualifications Standards to assess and document the significance of the resource according to the criteria of the National Register of Historic Places (NRHP), California Register of Historical Resources (CRHR) and California Historical Landmarks program.</p> <p>The qualified historian or architectural historian shall prepare an intensive-level historic resources evaluation. Evaluations shall consider buildings, structures, objects, sites, historic districts, and potential cultural landscapes and shall identify the character-defining features of such resources and other required information on the appropriate Department of Parks and Recreation (DPR) 523 Record Forms, which shall be appended to the evaluation.</p> <p>The level of documentation for each evaluation shall comply with Public Resources Code Section 5024 and 5024.5 with respect to state-owned historical resources. For resources determined through this evaluation process to meet NRHP/CRHR and/or California Historical Landmark criteria, MM CUL-2 and</p>	<p>Mitigation Measures CUL-1, CUL-2, CUL-3, and CUL-4 ensure adherence to applicable measures of the <i>Secretary’s Standards</i> and CSUF Design Guidelines for projects pertaining to the preservation, rehabilitation, and/or maintenance of historic properties on the CSUF campus to record, evaluate, avoid, or otherwise treat the historic resource appropriately. In some circumstances, documentation of a historical resource shall not mitigate the effects of demolition of that resource to a less-than-significant level because the historic resources would no longer exist. Therefore, the Campus Master Plan would result in significant and unavoidable impacts.</p>

Impact	Mitigation Measure (s)	Residual Impact
	<p>MM CUL-3 shall be required as early as possible in the project planning and design phase.</p> <p>If the resource was the subject of a historic resources evaluation meeting the standards of PRC Section 5024 and 5024.5 within the last five (5) years, CUL-1 shall not be required.</p> <p>For buildings, structures, objects, sites, historic districts, cultural landscapes, and other resources determined through this evaluation process not to meet NRHP/CRHR and/or California Historical Landmark criteria, no further mitigation is required.</p> <p><b>CUL-2 Conduct Secretary’s Standards Project Review and Analyze Impacts to Historical Resources</b></p> <p>For projects that would demolish or alter resources eligible for listing in the NRHP, CRHR, or as a California Historical Landmark, CSUF shall retain a historian or architectural historian who meets the Secretary of the Interior’s Professional Qualifications Standards to review and comment upon project plans for conformance with the Secretary’s Standards and applicable mitigation measures and/or alternatives.</p> <p>The architectural historian or preservation architect shall provide input to CSUF and the project design team as early as possible to facilitate project compliance with the Secretary’s Standards, if prudent and feasible. Preservation input will identify project options capable of complying with the Secretary’s Standards and avoiding, lessening, or mitigating significant adverse impacts to historical resources.</p> <p>Secretary’s Standards project review shall include all project components that would result in a physical change to character-defining features, insofar as these project details are available. If project details remain conceptual at the time of project review, the memorandum shall include design recommendations drawn from the Secretary’s Standards that would facilitate compliance with the Standards and avoid, lessen, or mitigate significant adverse impacts to historical resources.</p> <p>In addition, the Secretary’s Standards project review shall include a section assessing the potential direct and indirect impacts of the proposed project on the historical resource, whether an individual resource or historic district/cultural landscape.</p>	

Impact	Mitigation Measure (s)	Residual Impact
	<p>For projects that do not comply with the Secretary’s Standards and would result in a significant adverse impact to a historical resource, MM CUL-4 shall be required.</p> <p><b>CUL-3 PRC-Required SHPO Consultation</b></p> <p>For state-owned historical resources, PRC Section 5024 and 5024.5 require SHPO consultation for proposed projects that might impact historical resources eligible for the NRHP, CRHR or as a California Historical Landmarks. These sections of the PRC are designed to give SHPO the opportunity to review and comment on historical resource determinations and proposed projects that might affect such historical resources.</p> <p>CSUF shall consult with SHPO regarding the potential alteration or demolition of any buildings, structures, objects, sites, historic districts, cultural landscapes, or other campus features that appear eligible for listing in the National Register of Historic Places, the California Register of Historical Resources or as California Historical Landmarks, as documented through CUL-1 or through survey or evaluation. Such consultation shall be completed pursuant to California PRC Sections 5024 and 5024.5 and related guidance published by SHPO.</p> <p>Following the completion of CUL-1 and/or CUL-2 and as early as possible in the project planning phase, CSUF shall retain an architectural historian or historian meeting the Secretary of the Interior’s Professional Qualifications Standards in either architectural history or historic architecture in order to assist in SHPO consultation and compile the required documentation and consultation materials in compliance with PRC Sections 5024 and 5024.5 and related guidance published by SHPO.</p> <p>This shall include a formal request for consultation, the intensive-level historic resources evaluation establishing the historic resource status of the property, DPR 523 Record Forms, the appropriate historical background documentation, and a project-specific impacts analysis prepared by the qualified historian or architectural historian.</p> <p><b>CUL-4 HABS-Like Documentation</b></p> <p>For projects that do not comply with the Secretary’s Standards and would result in a significant adverse impact to a historical resource, MM CUL-4 shall be required. Prior to the commencement of construction activities, CSUF shall retain a historian or architectural</p>	

Impact	Mitigation Measure (s)	Residual Impact
	<p>historian who meets the Secretary of the Interior’s Professional Qualifications Standards to prepare HABS-like documentation for the subject historical resources. The evaluation process shall include the development of appropriate historical background research as context for the assessment of the significance of the structure in the history of the CSU system, CSUF, and the region. The HABS-like package will document in photographs and descriptive and historic narrative the historical resources slated for modification/demolition. Documentation prepared for the package will draw upon primary- and secondary-source research and available studies previously prepared for the project.</p> <p>The specifications for the HABS-like package follow:</p> <ul style="list-style-type: none"> <li>▪ Photographs: Photographic documentation will focus on the historical resources/features slated for demolition, with overview and context photographs for the campus and adjacent setting. Photographs will be taken of the building using a professional-quality single lens reflex (SLR) digital camera with a minimum resolution of 10 megapixels. Photographs will include context views, elevations/exteriors, architectural details, overall interiors, and interior details (if warranted). Digital photographs will be provided in electronic format.</li> <li>▪ Descriptive and Historic Narrative: The historian or architectural historian will prepare descriptive and historic narrative of the historical resources/features slated for demolition. Physical descriptions will detail each resource, elevation by elevation, with accompanying photographs, and information on how the resource fits within the broader campus during its period of significance. The historic narrative will include available information on the campus design, history, architect/contractor/designer as appropriate, area history, and historic context. In addition, the narrative will include a methodology section specifying the name of researcher, date of research, and sources/archives visited, as well as a bibliography. Within the written history, statements shall be footnoted as to their sources, where appropriate.</li> <li>▪ Historic Documentation Package Submittal: The electronic package will be assembled by the historian or architectural historian</li> </ul>	

Impact	Mitigation Measure (s)	Residual Impact
	<p>and submitted to CSUF for review and comment. In addition, an electronic version of the HABS package will be provided to the State Office of Historic Preservation for review and comment.</p> <ul style="list-style-type: none"> <li>▪ Upon approval by CSUF, one hard-copy version of the historic documentation package will be prepared and deposited with the University archives, Pollak Library Special Collections.</li> </ul>	
<p><b>Impact CUL-2.</b> No known archaeological resources or human remains are present on the campus. However, construction of the Campus Master Plan would involve ground-disturbing activities, such as grading and surface excavation, with the potential to unearth or adversely impact previously unidentified archaeological resources or human remains. Therefore, the Campus Master Plan would result in less than significant impacts with mitigations incorporated.</p>	<p><b>CUL-5. Unanticipated Discovery of Cultural and Tribal Cultural Resources.</b> In the event that cultural resources of Native American origin are identified during construction, all earth-disturbing work in the vicinity of the find shall be temporarily suspended or redirected until an archaeologist meeting the Secretary of the Interior’s Professional Qualifications Standards (NPS 1983) has evaluated the nature and significance of the find and an appropriate Native American representative, based on the nature of the find, is consulted. If CSUF determines that the resource is a tribal cultural resource and thus significant under CEQA, a mitigation plan shall be prepared and implemented in accordance with state guidelines and in consultation with Native American groups. The plan shall include avoidance of the resource or, if avoidance of the resource is infeasible, the plan shall outline the appropriate treatment and data recovery plan in coordination with the archeologist and the appropriate Native American tribal representative. The Native American monitor and consulting tribe(s) will be provided an opportunity to participate in the documentation and evaluation of the find. If a data recovery plan and treatment of the unanticipated discovery is required, then the consulting tribe(s) will be provided an opportunity to review and provide input on the plan and treatment.</p> <p><b>CUL-6. Discovery of Unknown Human Remains.</b> The discovery of human remains is always a possibility during ground disturbing activities. If human remains are found, the State of California Health and Safety Code Section 7050.5 states that no further disturbance shall occur until the County coroner has made a determination of origin and disposition pursuant to PRC Section 5097.98. In the event of an unanticipated discovery of human remains, the County coroner must be notified immediately. If the human remains are determined to be prehistoric, the coroner shall notify the NAHC,</p>	<p>Mitigation Measures CUL-5 and CUL-6 ensure construction and ground-disturbing activities would halt in the event previously unknown cultural resources or human remains are unearthed, and such resources would be properly identified and managed. Therefore, Campus Master Plan impacts to cultural resources and human remains would be less than significant with implementation of Mitigation Measures CUL-5 and CUL-6.</p>

Impact	Mitigation Measure (s)	Residual Impact
	<p>which will determine and notify a MLD. The MLD shall complete the inspection of the site within 48 hours of being granted site access and may recommend scientific removal, and nondestructive analysis of human remains and items associated with Native American burials, pursuant to Mitigation Measure CUL-2.</p>	
<b>Energy</b>		
<p><b>Impact ENG-1.</b> Development of the Campus Master Plan would not result in the wasteful or inefficient use of energy and would comply with CARB construction regulations and would operationally account for less than one percent of SCE and SCG supplies.</p>	<p>None required.</p>	<p>Less than significant.</p>
<p><b>Impact ENG-2.</b> Implementation of the Campus Master Plan would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency. Campus master Plan buildout would comply with Title 24, SB100 and the CSU Sustainability Policy and would not conflict with or obstruct applicable State plans related to renewable energy or energy efficiency.</p>	<p>None required.</p>	<p>Less than significant.</p>
<b>Greenhouse Gas Emissions</b>		
<p><b>Impact GHG-1.</b> The Campus Master Plan would generate GHG emissions during construction and operation that would exceed the GHG emission threshold. With mitigation, this impact would still exceed the threshold, and impacts would be significant and unavoidable.</p>	<p><b>GHG-1. GHG Emissions Reeducation Plan.</b> CSUF shall prepare and implement a plan to reduce operational GHG emissions through implementation of one or more of the following measures:</p> <ul style="list-style-type: none"> <li>a. Prior to the construction of CMP projects analyzed in this analysis,<sup>1</sup> CSUF shall develop a Greenhouse Gas Reduction Program (GGRP) that reduces annual GHG emissions from the CMP by a minimum of the MT CO<sub>2</sub>e per year that the project exceeds for that year and each subsequent year, which is estimated to be 8,325 MT CO<sub>2</sub>e in 2039 (1.15 MT CO<sub>2</sub>e per person per year in 2039) over the operational life of the project, or by an amount determined through further analysis of project GHG emissions at the time of GGRP preparation. The plan may include, but not be limited to, the following components: 1) Installation of renewable energy facilities (e.g., solar photovoltaics); 2) Purchase of renewable energy in lieu of fossil-fuel grid sources; 3)</li> </ul>	<p>Implementation of Mitigation Measure GHG-1 would reduce GHG emissions through creation and implementation of a GHG Reduction Plan. At this stage of planning, it is unknown what exact measures would be implemented as part of the plan and therefore reductions are not quantifiable. In addition, it is unknown if the measures would be able to reduce emissions to below the applicable thresholds due to the majority of the emissions coming from mobile emissions. Although project design features include TDM implementation that would have the effect of reducing mobile trips that was not included in modeling (e.g., mobility hubs that support</p>

<sup>1</sup> The analysis did not include projects in the Campus Master Plan considered “immediate” or part of the 5-year capital plan

Impact	Mitigation Measure (s)	Residual Impact
	Construction of residences that achieve energy and water efficiencies beyond those specified in the California Code of Regulations, Title 24 requirements; 4) Implementation of energy efficient building design exceeding California Building Code requirements; 5) Installation of energy-efficient equipment and appliances exceeding California Green Building Code standards; 6) Construction of all-electric buildings; 7) Installation of outdoor water conservation and recycling features, such as smart irrigation controllers and reclaimed water usage; 8) Installation of low-flow bathroom and kitchen fixtures and fittings; 9) Provision of incentives and outreach for future residents to promote alternative transportation and transit use; 10) Promotion of alternative fuel vehicles; 11) Increased provision of EV charging parking spaces beyond required; 12) Implementation of carbon sequestration measures.	transit, bikeshare, scootershare, carshare, on-demand rideshare, microtransit, electric vehicles [EV]’s, and rideables), ultimately vehicle emissions depend on individual transportation choices that CSUF would not have full control over. Therefore, impacts from GHG emissions would be significant and unavoidable.
<b>Impact GHG-2.</b> Due to GHG emissions during construction and operation that would exceed the threshold, the Campus Master Plan would conflict with the goals of the 2018 Scoping Plan, EO B-55-18, and ACUPCC. With mitigation, this impact would still exceed the project-specific threshold, and impacts would be significant and unavoidable.	See Mitigation Measure GHG-1 under Impact GHG-1.	See <i>Significance After Mitigation</i> discussion under Impact GHG-1.
<b>Geology and Soils</b>		
<b>Impact GEO-1.</b> The campus is not located in an Alquist-Priolo fault zone and no fault lines traverse directly under the site. There is potential for both earthquakes and ground shaking in the campus area. Impacts from earthquakes would be potentially significant.	<b>GEO-1. Perform site specific geotechnical investigations.</b> A site-specific geotechnical investigation shall be performed for each future development or redevelopment project proposed under the Campus Master Plan. Appropriate stabilization and site design recommendations, or low impact development features determined necessary to support proposed development shall be incorporated in the project design and implemented as part of project construction. Examples of stabilization and erosion control recommendations may include. But are not limited to: <ul style="list-style-type: none"> <li>▪ Installation of earthen buttress(es);</li> <li>▪ Excavation of landslide mass/material;</li> <li>▪ Slope stabilization through excavation into bench and/or keyways and other methods;</li> <li>▪ Deep soil mixing;</li> <li>▪ Installation of retaining walls;</li> </ul>	Impact would be less than significant with mitigation incorporated.

Impact	Mitigation Measure (s)	Residual Impact
	<ul style="list-style-type: none"> <li>▪ Use of tie-back anchors, micropiles or shear pins; or</li> <li>▪ A combination of any of these methods</li> </ul>	
<p><b>Impact GEO-2.</b> The campus would be subject to potential erosion of topsoil due to temporary construction activities. All construction would be subject to follow SWRCB's Construction Requirements and would be required to prepare a SWPPP. Additionally, CSUF is located on built-out, flat topography. Substantial soil erosion of topsoil would not occur given the above considerations. Impacts would be less than significant with mitigation incorporated.</p>	See Mitigation Measure GEO-1, above.	Impact would be less than significant with mitigation incorporated.
<p><b>Impact GEO-3.</b> The Campus Master Plan would not be located on a geologic unit or soil that is unstable, or that would become unstable, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse. All structures proposed to be constructed or redeveloped under the Campus Master Plan would be required to comply with the CSU Seismic Requirements and the latest CBC, to ensure structural design of all new and modified buildings would not result in adverse effects such on- or off-site landslides, lateral spreading, subsidence, liquefaction, or collapse.</p>	None required.	Less than Significant.
<p><b>Impact GEO-4.</b> The campus is located on a site with Mocho Loam which has expansive properties. However, projects under the Campus Master Plan would comply with applicable regulations set forth by the UBC, Division of the State Architect (DSA), and CGS, which would minimize risks to life and property in relation to expanding soils.</p>	None required.	Less than significant.

Impact	Mitigation Measure (s)	Residual Impact
<p><b>Impact GEO-5.</b> The Campus Master Plan does not include the use of septic tanks or alternative wastewater disposal systems. Reference Section 4.13 for further discussion.</p>	<p>None required.</p>	<p>No impact.</p>
<p><b>Impact GEO-6.</b> The campus includes underlying geologic units that have paleontological sensitivity ranging from low to high. Potential for paleontological resources may occur during ground-disturbing activities for certain projects. Mitigation measures have been identified to reduce impacts in the event of an unanticipated discovery of paleontological resources. Impacts would be less than significant with mitigation measures incorporated.</p>	<p><b>GEO-2. Retain a Qualified Paleontologist.</b> Prior to the commencement of ground disturbing activities, a qualified professional paleontologist shall be retained to review all project plans where ground disturbance is expected to occur at or below eight feet below ground surface (bgs) within areas mapped as Holocene alluvial deposits (Qa) to determine if underlying paleontologically sensitive units (i.e., Pleistocene age deposits or the La Habra Formation) could be impacted. If potentially significant impacts are identified, the qualified professional paleontologist shall prepare and implement a Paleontological Resources Mitigation Plan (PRMP). A Qualified Paleontologist is an individual who meets the education and professional experience standards as set forth by the SVP (2010), which recommends the paleontologist shall have at least a Master’s Degree or equivalent work experience in paleontology, shall have knowledge of the local paleontology, and shall be familiar with paleontological procedures and techniques. The PRMP shall describe mitigation recommendations in detail, including paleontological monitoring procedures; communication protocols to be followed in the event that an unanticipated fossil discovery is made during project development; and preparation, curation, and reporting requirements</p> <p><b>GEO-3. Paleontological Worker Environmental Awareness Program (WEAP).</b> Prior to the start of construction, the Qualified Paleontologist or his or her designee, shall conduct training for construction personnel regarding the appearance of fossils and the procedures for notifying paleontological staff should fossils be discovered by construction staff. The WEAP shall be fulfilled at the time of a preconstruction meeting. In the event a fossil is discovered by construction personnel anywhere in the campus, all work in the immediate vicinity of the find shall cease and a qualified paleontologist shall be contacted to evaluate the find before re-starting work in the area. If it is determined that the fossil(s) is (are) scientifically significant, the qualified paleontologist shall complete the mitigation</p>	<p>Impact would be less than significant with mitigation incorporated.</p>

Impact	Mitigation Measure (s)	Residual Impact
	<p>outlined below to mitigate impacts to significant fossil resources.</p> <p><b>GEO-4 Paleontological Monitoring.</b> Initially, full-time monitoring shall be conducted during ground construction activities (i.e., grading, trenching, foundation work, and other excavations) in areas where ground disturbance would occur at or below eight feet bgs within intact Holocene deposits. Monitoring shall be conducted by a qualified paleontological monitor, who is defined as an individual who meets the minimum qualifications per standards set forth by the SVP (2010), which includes a B.S. or B.A. degree in geology or paleontology with one year of monitoring experience and knowledge of collection and salvage of paleontological resources. The duration and timing of the monitoring shall be determined by the Qualified Paleontologist and the location and extent of proposed ground disturbance. If the Qualified Paleontologist determines that full-time monitoring is no longer warranted, based on the specific geologic conditions at the surface or at depth, the Qualified Paleontologist may recommend that monitoring be reduced to periodic spot-checking or cease entirely.</p> <p><b>GEO-5. Fossil Discovery, Preparation, and Curation.</b> If a paleontological resource is discovered, the monitor shall have the authority to temporarily divert the construction equipment around the find until it is assessed for scientific significance and collected. Typically, fossils can be safely salvaged quickly by a single paleontologist and not disrupt construction activity. In some cases, larger fossils (such as complete skeletons or large mammals) require more extensive excavation and longer salvage periods. In this case, the paleontologist should have the authority to temporarily direct, divert or halt construction activity to ensure that the fossil(s) can be removed in a safe and timely manner.</p> <p><b>GEO-6. Final Paleontological Mitigation Report.</b> At the conclusion of laboratory work and museum curation, a final report shall be prepared describing the results of the paleontological mitigation monitoring efforts associated with the project. The report shall include a summary of the field and laboratory methods, an overview of the project geology and paleontology, a list of taxa recovered (if any), an analysis of fossils recovered (if any) and their scientific significance, and</p>	

Impact	Mitigation Measure (s)	Residual Impact
	recommendations. The final report shall be submitted to the CSUF. If the monitoring efforts produced fossils, then a copy of the report shall also be submitted to the designated museum repository.	
<b>Hazards and Hazardous Materials</b>		
<p><b>Impact HAZ-1.</b> Development of the Campus Master Plan would not create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials. Protocols established for current and future campus operational and maintenance activities adhere to applicable local, state, and federal laws regulating the use and transport of hazardous materials. References Section 4.13 for further discussion.</p>	None required.	Less than significant.
<p><b>Impact HAZ-2.</b> The Campus Master Plan would not create a significant hazard to the public or the environment through reasonably foreseeable upset and accidental conditions involving the release of hazardous materials into the environment. Chemical safety training is required for all students who work with chemicals, in order to minimize the occurrence of accidental chemical releases and ensure that, when one does occur, it is handled in a safe manner. <i>References Section 4.13 for further discussion.</i></p>	None required.	Less than significant.
<p><b>Impact HAZ-3.</b> The Campus Master Plan would not emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school. The campus is a school itself and has a number of schools within a quarter of a mile. However, the US Department of Transportation regulates the transportation of hazardous materials through implementation of the Hazardous Materials Transportation Act minimizing impacts. Reference Section 4.13 for further discussion.</p>	None required.	Less than significant.

Impact	Mitigation Measure (s)	Residual Impact
<p><b>Impact HAZ-4.</b> The Campus Master Plan would not be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5. A review of the USEPA's Superfund National Priorities List found that there are no superfund sites within CSUF or immediate vicinity. The GeoTracker database contains four sites in the campus area that were previously contaminated; chiefly, gasoline contamination on the ground. All four sites have been cleaned, closed, and require no further action. Reference Section 4.13 for further discussion.</p>	None required.	Less than significant.
<p><b>Impact HAZ-5.</b> The campus is not located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would result in a safety hazard or excessive noise. The campus is not located in the planning area or impact zone for the Fullerton Municipal Airport or any other airport land use plan. Reference Section 4.13 for further discussion.</p>	None required.	Less than significant.
<p><b>Impact HAZ-6.</b> Development of the Campus Master Plan would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan. The Campus Master Plan would maintain and/or enhance existing access points to and internal circulation routes on the campus. The FFD and the DSA are required to complete an access compliance review and a fire and life safety review prior to approval of individual project drawings and specification documents.</p>	None required.	Less than significant.
<p><b>Impact HAZ-7.</b> Development of the Campus Master Plan would not expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires. The campus is located in an urbanized</p>	None required.	Less than significant.

Impact	Mitigation Measure (s)	Residual Impact
<p>area with no adjacent wildlands and is not located in a fire hazard severity zone as shown on California Department of Forestry &amp; Fire Protection's (CAL FIRE) fire hazard severity zone map.</p>		
<p><b>Hydrology and Water Quality</b></p>		
<p><b>Impact Hydro-1.</b> The Campus Master Plan would not violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality. Projects under the Campus Master Plan would be required to comply with all applicable stormwater discharge regulations. Projects under the Campus Master Plan would collectively result in land disturbance of more than one acre and would therefore be required to comply with NPDES regulations for construction stormwater discharge, and the development of a SWPPP, required by the Construction General Permit, General Permit Order 2009-0009-DWQ.</p>	<p>None required.</p>	<p>Less than significant.</p>
<p><b>Impact Hydro-2.</b> Development of the Campus Master Plan would not substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that it may impede sustainable groundwater management of the basin. The geography and the CSUF's continued compliance with stormwater runoff regulations would reduce impact on groundwater resources. The City provides water service to the campus and would continue to do so under the Campus Master Plan. No on-site groundwater wells are proposed as part of the Campus Master Plan.</p>	<p>None required.</p>	<p>Less than significant.</p>
<p><b>Impact Hydro-3.</b> Development of the Campus Master Plan would not substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces.</p>	<p>None required.</p>	<p>Less than significant.</p>

Impact	Mitigation Measure (s)	Residual Impact
<p>The campus is largely developed with existing academic uses associated with the campus. Such uses include substantial impervious surface cover and, consequently, buildout under the Campus Master Plan would not be expected to result in substantial alterations to drainage patterns.</p>		
<p><b>Impact Hydro-4.</b> The Campus Master Plan would not cause flood hazard, tsunami, or seiche zones, or risk release of pollutants.</p>	<p>None required.</p>	<p>No impact.</p>
<p><b>Impact Hyrdo-5.</b> Development of the Campus Master Plan would not conflict with or obstruct implementation of a water quality control or sustainable groundwater management plan. CSUF has a campus-wide Storm Water Management Program that includes 12 BMPs, which aim to address stormwater threats from operational and maintenance activities for the campus (CSUF 2018b; CSUF 2019a). Therefore, projects under the Campus Master Plan would require compliance with the NPDES Construction General Permit during construction activities and compliance with CSUF’s Storm Water Management Program during use, operation, and maintenance of the CSUF campus under Campus Master Plan full buildout.</p>	<p>None required.</p>	<p>Less than significant.</p>
<p><b>Land Use Planning</b></p>		
<p><b>Impact LU-1.</b> Development of the Campus Master Plan would not physically divide an established community. The redevelopment under the Campus Master Plan would occur entirely within the existing campus footprint and does not propose an extension of campus outside of the existing campus boundaries, nor propose or create the need for new roadways. Utility infrastructure improvements would be temporary and would not encroach or impact existing</p>	<p>None required.</p>	<p>Less than significant.</p>

Impact	Mitigation Measure (s)	Residual Impact
neighborhoods or the surrounding community.		
<p><b>Impact LU-2.</b> The Campus Master Plan would not cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect. The City of Fullerton does not have jurisdiction over CSUF; however, CSUF considers aspects of local plans and policies for the communities surrounding the campus when it is appropriate and feasible, although it is not bound by those plans and policies in its planning efforts.</p>	None required.	Less than significant.
<b>Mineral Resources</b>		
<p><b>Impact MIN-1.</b> Development of the Campus Master Plan would not result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state. No portions of CSUF are utilized for mineral extraction. The City of Fullerton does not contain any land uses within City jurisdiction for mining or mineral extraction activities.</p>	None required.	No impact.
<p><b>Impact MIN-2.</b> The Campus Master Plan would not result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan. Therefore, implementation of the Campus Master Plan would not result in loss of availability of a known mineral resource or a locally-important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan, as no known mineral resources are located in the campus area.</p>	None required.	No impact.
<b>Noise</b>		
<p><b>Impact N-1.</b> Construction and operation of the Campus Master Plan would result in noise level increases that would exceed applicable construction and</p>	<p><b>N-1. Pile Driver Noise and Vibration Reduction Measures.</b> If pile driving is to be used within 260 feet of a structure during project construction, one of the following measures shall be implemented:</p>	<p>Impacts from construction using a pile driver would be less than significant with implementation of Mitigation Measure N-1. Impacts from</p>

Impact	Mitigation Measure (s)	Residual Impact
<p>operation noise standards at nearby noise sensitive receivers. Impacts from construction and operation noise would be potentially significant.</p>	<ul style="list-style-type: none"> <li>▪ Use of a pile driver shall not occur within 260 feet of a structure; or</li> <li>▪ A Campus Master Plan-specific noise and vibration impact analysis shall be conducted that shall consider the type of pile driver used and potential noise and vibration levels at structures within 260 feet. If, after consideration of the type of pile driver used and other factors of the environment, noise levels do not exceed 80 dBA (8-hour) and vibration levels do not exceed the distinctly perceptible impact for humans of 0.24 in/sec PPV and the structural damage impact to residential structures of 0.2 in/sec PPV, construction may proceed without additional measures. If, after consideration of the type of pile driver used and other factors of the environment, noise levels exceed 80 dBA (8-hour) or vibration levels exceed the distinctly perceptible impact for humans of 0.24 in/sec PPV or the structural damage impact to residential structures of 0.2 in/sec PPV, additional measures shall be implemented to reduce noise and vibration levels below threshold. These measures may include, but not be limited to, use of temporary noise barriers or performing pile driving at a further distance from the noise-sensitive land use.</li> </ul> <p><b>N-2. HVAC Noise Reduction Measures.</b>                      Concurrent with design review and prior to the approval of building permits, CSUF shall require a Campus Master Plan-specific design plan for projects demonstrating that the noise level from operation of HVAC units shall not cumulatively exceed the following noise level limits at receiving noise-sensitive land uses as specified in Fullerton Municipal Code Chapter 15.9045:</p> <ul style="list-style-type: none"> <li>▪ For exterior locations, 55 dBA from 7:00 a.m. to 10:00 p.m. and 50 dBA from 10:00 p.m. to 7:00 a.m.</li> <li>▪ For interior locations, 55 dBA from 7:00 a.m. to 10:00 p.m. and 45 dBA from 10:00 p.m. to 7:00 a.m.</li> </ul> <p>Noise control measures shall include, but are not limited to, the selection of quiet equipment, equipment setbacks, silencers, and/or acoustical louvers.</p>	<p>operational noise from HVAC units would be less than significant with implementation of Mitigation Measure N-2.</p>

Impact	Mitigation Measure (s)	Residual Impact
<p><b>Impact N-2.</b> Vibration from pile driving during construction may exceed applicable standards. The impact would be potentially significant.</p>	<p>See Mitigation Measure N-1 above.</p>	<p>Impacts associated with vibration from construction activities would be less than significant with implementation of Mitigation Measure N-1.</p>
<p><b>Population and Housing</b></p>		
<p><b>Impact POP-1.</b> Implementation of the Campus Master Plan would not induce substantial unplanned population growth in an area, either directly or indirectly. Based on SCAG’s projections, the addition of 8,000 residents under the Campus Master Plan would account for less than one percent of the total area population by 2040 and would not represent substantial unplanned growth.</p>	<p>None required.</p>	<p>Less than significant.</p>
<p><b>Impact POP-2.</b> Development of the Campus Master Plan would not displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere. Local policies, including those included in The Fullerton Plan and Municipal Code, would guide housing development to accommodate the needs of future population growth, particularly housing for low-income residents, and decrease potential impacts to existing residents from housing and economic displacement.</p>	<p>None required.</p>	<p>Less than significant.</p>
<p><b>Public Services</b></p>		
<p><b>Impact PSUB-1a.</b> Development of the Campus Master Plan would not result in substantial adverse physical impacts associated with the provision of new or physically altered fire protection facilities, or the need for new or physically altered fire protection facilities. All site and building improvements carried out under the Campus Master Plan would be required to comply with the 2016 Fire and Building Code requirements for construction, access, water mains, fire flows, and hydrants, and would be subject to review and approval by the FFD prior to building permit and certificate of occupancy issuance.</p>	<p>None required.</p>	<p>Less than significant.</p>

Impact	Mitigation Measure (s)	Residual Impact
<p>Implementation would result in the continuation of existing academic programs, extra-curricular activities, and similar housing and instructional facilities and would not fundamentally change the nature of campus operations.</p>		
<p><b>Impact PSUB-1b.</b> The Campus Master Plan would not result in substantial adverse physical impacts associated with the provision of new or physically altered police protection facilities, or the need for new or physically altered police protection facilities. Construction would not cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives. Implementation of the Campus Master Plan would incrementally increase the service population of the Fullerton Police Department (FPD). The University Police Department (UPD), which has primary jurisdiction on campus, would reduce demand for FPD services. Facility space for the UPD is included in the Campus Master Plan.</p>	<p>None required.</p>	<p>Less than significant.</p>
<p><b>Impact PSUB-1c.</b> The Campus Master Plan would not result in substantial adverse physical impacts associated with the provision of new or physically altered schools, or the need for new or physically altered schools. Construction would not cause significant environmental impacts, in order to maintain acceptable service ratios or other performance objectives. Implementation of the Campus Master Plan would incrementally increase the enrollment of students in local schools. However, enrollment would not cause schools to exceed capacity.</p>	<p>None required.</p>	<p>Less than significant.</p>
<p><b>Impact PSUB-1d.</b> The Campus Master Plan would not result in substantial adverse physical impacts associated with the provision of new or physically</p>	<p>None required.</p>	<p>Less than significant.</p>

Impact	Mitigation Measure (s)	Residual Impact
<p>altered public facilities, or the need for new or physically altered public facilities. Construction would not cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives.</p>		
<b>Recreation</b>		
<p><b>Impact REC-1.</b> The Campus Master Plan would not increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated. The Campus Master Plan would incrementally increase the use of existing open space and recreational facilities. However, the Campus Master Plan would incrementally develop six signature forms of open space to help reduce off-campus affects.</p> <p><u>Development of the Campus Master Plan would not include recreational facilities or require the construction or expansion of recreational facilities that would have an adverse physical effect on the environment. The Campus Master Plan would include maintenance, improvement, and construction of parks and recreation facilities to serve an associated increase in population and would not require the construction or expansion of facilities beyond what is proposed in the Campus Master Plan.</u></p>	<p>None required.</p>	<p>Less than significant.</p>
<p><del><b>Impact REC 2.</b> Development of the Campus Master Plan would not include recreational facilities or require the construction or expansion of recreational facilities that would have an adverse physical effect on the environment. The Campus Master Plan would include maintenance, improvement, and construction of parks and recreation facilities to serve an associated increase in population and would not require the construction or expansion of</del></p>	<p><del>None required.</del></p>	<p><del>Less than significant.</del></p>

Impact	Mitigation Measure (s)	Residual Impact
<p>facilities beyond what is proposed in the Campus Master Plan.</p>		
<p><b>Transportation and Traffic</b></p>		
<p><b>Impact TRAN-1.</b> The Campus Master Plan would not conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities. Development under the Campus Master Plan would be consistent with Applicable CSU programs, plans, and policies. Implementation of the Campus Master Plan would not result in major changes to the design, location, or access to existing transit, campus circulation, or bicycle and pedestrian facilities.</p>	<p>None required.</p>	<p>Less than significant.</p>
<p><b>Impact TRAN-2.</b> The Campus Master Plan would not conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b), such that it would result in VMT per service population for the campus as a whole that exceeds 18.90 (i.e., 15 percent below citywide VMT per service population. Project-generated VMT per service population would be below the CSU TSM threshold under relatively constant conditions.</p>	<p>None required.</p>	<p>Less than significant.</p>
<p><b>Impact TRAN-3.</b> The Campus Master Plan would not substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment). Development under the Campus Master Plan would be constructed in such a way that changes would remain consistent to surrounding geometric design features and any redesign or construction of on-campus circulation paths would be designed and constructed to meet applicable City and Campus Master Plan design standards.</p>	<p>None required.</p>	<p>Less than significant.</p>
<p><b>Impact TRAN-4.</b> Development of the Campus Master Plan would not result in inadequate emergency access. Development</p>	<p>None required.</p>	<p>Less than significant.</p>

Impact	Mitigation Measure (s)	Residual Impact
<p>under the Campus Master Plan would not include major changes to existing access points or on-campus circulation paths. All projects under the Campus Master Plan would adhere to State University policy and undergo review and approval by the State Fire Marshal prior to implementation and use.</p>		
<p><b>Tribal Cultural Resources</b></p>		
<p><b>Impact TCR-1.</b> Development of the Campus Master Plan would not cause a substantial adverse change in the significance of a tribal cultural resource that is listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in PRC §5020.1. No tribal cultural resources have been identified from AB 52 consultation efforts and the area of disturbance for the campus is not known or expected to contain any tribal cultural resources that would qualify as a historical resource or a unique cultural resource.</p>	<p>Mitigation Measures CUL-2 and CUL-3 are required.</p>	<p>Less than significant.</p>
<p><b>Impact TCR-2.</b> Development of the Campus Master Plan would not cause a substantial adverse change in the significance of a tribal cultural resource that is a resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in PRC Section 5024.1(c).</p>	<p>Mitigation Measures CUL-2 and CUL-3 are required.</p>	<p>Less than significant.</p>
<p><b>Utilities and Service Systems</b></p>		
<p><b>Impact UTIL-1a.</b> Development of the Campus Master Plan would not require or result in the relocation or construction of new or expanded water, wastewater treatment or stormwater drainage, or telecommunications facilities. Construction of which could cause significant environmental effects. The Campus Master Plan may require installation of additional water main lines, lateral connections, and hydrants within the plan area</p>	<p>None required.</p>	<p>Less than significant.</p>

Impact	Mitigation Measure (s)	Residual Impact
<p>to serve planned facilities. Such facilities would be installed during individual project construction and within the disturbance area of such projects or previously disturbed roadways.</p>		
<p><b>Impact U-2/FIL-1b.</b> The Campus Master Plan may require installation of additional sewer lines and lateral connections within the plan area to serve planned facilities. As with water facilities, any sewer line extensions necessary to serve the future facilities would generally be installed within the already disturbed ROW of existing roads or within the disturbance footprint of proposed buildings.</p>	<p>None required.</p>	<p>Less than significant.</p>
<p><b>Impact U-3/FIL-1c.</b> All individual projects constructed under the Campus Master Plan would constitute regulated projects under the Phase II MS4 Permit and, therefore, would be required to demonstrate compliance with the stormwater capture requirements described in the permit. As with water and wastewater facilities, proposed storm drain infrastructure would be constructed within the disturbance area of individual projects or previously disturbed roadways and would not result in substantial additional impacts.</p>	<p>None required.</p>	<p>Less than significant.</p>
<p><b>Impact U-4/FIL-1d.</b> No major telecommunications improvements are proposed as part of the Campus Master Plan. Individual projects occurring under the Campus Master Plan may require minor telecommunications improvements, such as undergrounding of telephone lines or rewiring of buildings during renovation. Such improvements would be minor in nature and would generally occur within the disturbance area of individual projects.</p>	<p>None required.</p>	<p>Less than significant.</p>

Impact	Mitigation Measure (s)	Residual Impact
<p><b>Impact U-5</b><del><b>U-11</b></del><b>-2.</b> The Campus Master Plan would have sufficient water supplies available during normal, dry and multiple dry years. Construction and operation of the Campus Master Plan would result in a net increase in water demand of approximately 1,198 AFY of water. This increase in demand through 2040 is accounted for in the City of Fullerton’s 2015 Urban Water Management Plan.</p>	<p>None required.</p>	<p>Less than significant.</p>
<p><b>Impact U-6</b><del><b>U-11</b></del><b>-3.</b> The Campus Master Plan would not result in a determination by the wastewater treatment provider that it does not have adequate capacity to serve the project in addition to the provider’s existing commitments. Wastewater generated by development under the Campus Master Plan would be treated at the Orange County Sanitation District’s Treatment Plant Number 2 facility in Huntington Beach. The plant would have adequate capacity to serve the Campus Master Plan’s anticipated wastewater generation in addition to its existing wastewater treatment commitments.</p>	<p>None required.</p>	<p>Less than significant.</p>
<p><b>Impact U-7a</b><del><b>U-11</b></del><b>-4.</b> The Campus Master Plan would not generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals. The Campus Master Plan would not generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, including the Frank R. Bowerman Landfill.</p>	<p>None required.</p>	<p>Less than significant.</p>
<p><b>Impact U-7b</b><del><b>U-11</b></del><b>-5.</b> The Campus Master Plan would comply with federal, State, and local management and reduction statutes and regulations related to solid waste. The Campus Master Plan would be required to comply with federal, state, and CSU</p>	<p>None required.</p>	<p>Less than significant.</p>

Impact	Mitigation Measure (s)	Residual Impact
statutes and regulations related to solid waste.		
<b>Wildfire</b>		
<b>Impact WILD-1.</b> The Campus Master Plan would not substantially impair an adopted emergency response plan or emergency evacuation plan.	None required.	No impact.
<b>Impact WILD-2.</b> The Campus Master Plan would not exacerbate wildfire risks due to slope, prevailing winds, and other factors, and thereby expose campus occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire.	None required.	Less than significant.
<b>Impact WILD-3.</b> The Campus Master Plan would not require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment.	None required.	Less than significant.
<b>Impact WILD-4.</b> Development of the Campus Master Plan would not expose people or structures to significant risks, including downslopes or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes. CSUF is developed with relatively flat topography and proposed uses under the Campus Master Plan would remain the same as current uses.	None required.	Less than significant.

*This page intentionally left blank*

# 1 Introduction

---

This Environmental Impact Report (EIR) evaluates impacts associated with the update to the Campus Master Plan for California State University, Fullerton (CSUF) at 800 North State College Boulevard, Fullerton, California. This EIR has been prepared under the direction of California State University (CSU) Board of Trustees (Trustees) in accordance with the requirements of the California Environmental Quality Act (CEQA) (Public Resources Code [PRC] Section 21000 et seq.) and the CEQA Guidelines. This section discusses:

- Project requiring environmental analysis (synopsis);
- Type, purpose, and intended uses of the Draft EIR;
- Scope and content of the Draft EIR; and
- Agency roles and responsibilities.

## 1.1 Project Requiring Environmental Analysis

The following is a synopsis of the project characteristics. For additional information on the Campus Master Plan, see section 2.0, *Project Description*.

CSUF has become one of the top two largest universities within the CSU system periodically accommodating the largest FTES enrollment of any of the 23 campuses, since approval of the 2003 Campus Master Plan (2003 Master Plan). The 2003 Master Plan is now outdated and inadequate to accommodate CSUF's continued growing demand. Moreover, CSUF and the City of Fullerton have undergone considerable demographic, economic, political, and social changes within the last decade and a half. The Campus Master Plan provides a framework for managing future campus growth and change, as well as the campus's relationship with the City in a strategic and orderly way.

The Campus Master Plan would support and advance the University's educational mission through the provision of recommendations for future land uses, enhancement and replacement of existing facilities, infrastructure improvements, and improved intra-campus pedestrian connectivity. Key proposed Campus Master Plan components include net new on-campus housing for up to 3,000 students, a 6,000-seat event center, recreational facility and student union upgrades, new facilities and programs to enhance the University's Fullerton Arboretum, increased parking capacity, new transit mobility hubs, and a pedestrian bridge access across Nutwood Avenue. The Campus Master Plan would accommodate up to 32,000 full-time equivalent students (FTES) through the year 2039, an increase from the previously approved enrollment level of 25,000 as of the 2016/2017 academic year. The net new addition of approximately 5,044,111 gross square feet (gsf) of additional on-campus facilities is proposed as part of the Campus Master Plan.

Ultimately, the project is intended to create an environment that fosters a complete, vibrant campus life, with increased amenities for student learning and informal engagement, expanded student housing and campus student life, greater accommodation of diverse modes of transit, and appropriate sustainability features and practices. Project implementation is anticipated in phases as funding and design are finalized.

## 1.2 Purpose and Legal Authority

The Campus Master Plan requires the approval of the California State University, Board of Trustees. The Campus Master Plan is subject to the environmental review requirements of CEQA. According to CEQA, preparation of an EIR is required whenever it can be fairly argued, based on substantial evidence, that a proposed project may result in a significant environmental impact. An EIR is an informational document used to inform public-agency decision makers and the public of significant environmental impacts of a project, identify possible ways to minimize the impacts, and describe reasonable alternatives to the project that could feasibly attain most of the basic objectives of the project while substantially lessening or avoiding any of the significant environmental impacts. Public agencies are required to consider the information presented in the EIR when determining whether to approve a project. This Draft EIR has been prepared to meet the requirements of a program EIR as defined by Section 15168 of the CEQA Guidelines. As described in CEQA Guidelines Section 15168(a), a program EIR may be prepared for a series of action that can be characterized as one large project and are related either:

- (1) Geographically;
- (2) As logical parts in the chain of contemplated actions;
- (3) In connection with the issuance of rules, regulations, plans, or other general criteria to govern the conduct of a continuing program; or
- (4) As individual activities carried out under the same authorizing statutory or regulatory authority and having generally similar environmental impacts which can be mitigated in similar ways.”

A program EIR can be used as the basic, general environmental assessment for an overall program of projects developed over a multi-year planning horizon, and therefore is an appropriate review document for the 2035 Master Plan. A program EIR has several advantages. For example, it provides a basic reference document to avoid unnecessary repetition of facts or analysis in subsequent project-specific assessments. It also allows the lead agency to consider the broad, regional impacts of a program of actions before its adoption and eliminates redundant or contradictory approaches to the consideration of regional and cumulative impacts.

## 1.3 Scope of this EIR

This EIR addresses the following 20 environmental issue areas as well as other CEQA mandated issues (i.e., cumulative impacts, growth-inducing impacts significant unavoidable impacts, alternatives):

- Aesthetics
- Agriculture and Forestry Resources
- Air Quality
- Biological Resources
- Cultural Resources
- Energy Conservation
- Geology and Soils
- Land Use and Planning
- Mineral Resources
- Noise
- Population and Housing
- Public Services
- Recreation
- Transportation

- Greenhouse Gas Emissions
- Hazardous and Hazardous Materials
- Hydrology and Water Quality
- Tribal Cultural Resources
- Utilities and Service Systems
- Wildfire

The alternatives section of the EIR (Section 7.0) was prepared in accordance with Section 15126.6 of the CEQA Guidelines and focuses on alternatives that are capable of eliminating or reducing significant adverse effects associated with the project while feasibly attaining most of the basic project objectives. In addition, the alternatives section identifies the "environmentally superior" alternative among the alternatives assessed. The alternatives evaluated include the CEQA-required "No Project" alternative and two alternative development scenarios for the project area.

The level of detail contained throughout this EIR is consistent with the requirements of CEQA and applicable court decisions. Section 15151 of the CEQA Guidelines provides the standard of adequacy on which this document is based:

An EIR should be prepared with a sufficient degree of analysis to provide decisionmakers with information which enables them to make a decision which intelligently takes account of environmental consequences. An evaluation of the environmental effects of the proposed project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in light of what is reasonably feasible. Disagreement among experts does not make an EIR inadequate, but the EIR should summarize the main points of disagreement among the experts. The courts have looked not for perfection but for adequacy, completeness, and a good faith effort at full disclosure.

In preparing the EIR, use was made of pertinent CSU and CSUF policies and guidelines, certified EIRs and adopted CEQA documents, and other background documents. A full reference list is contained in Section 8.0, *References*.

## 1.4 Lead, Responsible, and Trustee Agencies

The CEQA Guidelines define lead, responsible and trustee agencies. The California State University, Board of Trustees (Trustees) is the lead agency because it holds principal responsibility for approving the Campus Master Plan.

A responsible agency refers to a public agency other than the lead agency that has discretionary approval over the Campus Master Plan. Responsible agencies include the Orange County Water District, which regulates water quality in the region, and the South Coast Air Quality Management District, which regulates air quality in the region. The EIR will also be submitted to these agencies for review and comment.

Trustee agencies are state agencies with legal jurisdiction over natural resources affected by the Campus Master Plan that are held in trust for the people of the state of California. Responsible and trustee agencies include:

### State Agencies

- **California Department of Fish and Wildlife** - Section 1600 Streambed Alteration Agreement and compliance with California Endangered Species Act for potential take of listed species (if needed).
- **California Department of Transportation** - regulates California state roads and highways.
- **State Fire Marshal** - future facility fire safety review and approval.

## Regional and Local Agencies

- **City of Fullerton** -encroachment Permits for work within City’s streets and rights-of-way.
- **Regional Water Quality Control Board** - Section 401 Certification and Storm Water Discharge Permits.
- **Orange County Water District** - regulates water quality in the region.
- **South Coast Air Quality Management District** - regulates air quality in the region.
- **Orange County Transportation Authority** - approval of any future regional bus service improvement.

## 1.5 Environmental Review Process

The environmental impact review process, as required under CEQA, is summarized below and illustrated in Figure 1-1. The steps are presented in sequential order.

1. **NOP and Initial Study.** Pursuant to the provision of Section 15082 of the CEQA Guidelines, the Trustees (as lead agency) issued a NOP for public review and comment (see Appendix A of this EIR). As required by CEQA Guidelines Section 15375, an NOP is a brief document sent by the lead agency to notify the responsible agencies, trustee agencies, the Governor’s Office of Planning and Research (OPR), and other involved agencies that the lead agency plans to prepare an EIR for a project. The purpose of the notice is to solicit guidance from those agencies as to the scope and content of the environmental information to be included in the EIR and to solicit recommendations and develop information regarding the scope, focus, and content of the EIR. The public review and scoping period for the Campus Master Plan NOP was from August 30, 2019, to October 3, 2019, in accordance with Section 15082 of the CEQA Guidelines. In addition, CSUF held a scoping meeting on September 19, 2019, to give the public opportunity to receive more information on the Campus Master Plan and to provide comments and suggestions on the scope of the EIR. Comments on the scope and content of the EIR were received and written comments are included in Appendix B of this EIR.
2. **Draft EIR.** Public and agency review of the Campus Master Plan will be further encouraged through distribution of the Draft EIR for at least the required 45-day public review period. Due to current circumstances associated with COVID-19 (California Executive Order N-33-20), a public meeting to present the contents of this EIR and to receive written and oral comments will not be held. However, an online presentation video will be made available at the CSUF Master Plan website (<https://masterplan.fullerton.edu>) for the duration of the Draft EIR public review period.

This EIR, as well as appendices and all supporting materials and references, can be found at the CSUF Master Plan website (<https://masterplan.fullerton.edu>). In addition, due to current circumstances associated with COVID-19, the campus and local public libraries are not accessible to the public for review of hard copies of the Draft EIR. Therefore, a limited number of flash drives will be made available to interested members of the public who may be unable to access the document online.

Written comments should be submitted by mail, email or fax, with appropriate contact information, to the following:

Emil Zordilla  
 Director of Planning and Design – Campus Architect  
 Capital Programs & Facilities Management  
 California State University, Fullerton  
 800 N. State College Boulevard  
 Fullerton, California 92831  
[ezordilla@fullerton.edu](mailto:ezordilla@fullerton.edu)  
 FAX: (657) 278-1094

Any agency, organization, or members of the public desiring to comment on the EIR must submit their comments prior to the end of the public comment period.

3. **Notice of Completion.** The provisions of Sections 15085(a) and 15087(a)(1) of the CEQA Guidelines require that as soon as the Draft EIR is completed, the lead agency must file a Notice of Completion (NOC) with OPR and that a public Notice of Availability (NOA) be provided to all organizations and individuals who have previously requested notification. The Trustees, serving as the lead agency, provided the NOC to OPR and circulated an NOA of the Draft EIR to campus organizations, in addition to public agencies, special districts, tribal representatives, organizations, and individuals that commented on the NOP and/or requested to be kept informed of the Campus Master Plan. In addition, CSUF placed a public notice in a local paper of general circulation within the project vicinity.
4. **Final EIR.** A Final EIR consists of the Draft EIR; revisions to the Draft EIR; responses to comments addressing concerns raised by individuals, organizations, and public agencies or other reviewing parties; and a Mitigation Monitoring and Reporting Program (MMRP). According to PRC Section 21081.6, for projects in which significant impacts would be minimized by mitigation measures, the lead agency must include an MMRP. The purpose of an MMRP is to ensure compliance with required mitigation measures during implementation of the project. After the Final EIR is completed, and at least 10 days prior to its certification, a copy of the response to comments on the Draft EIR will be provided or made available to all commenting parties.
5. **Certification of Final EIR.** Prior to making a decision on a Campus Master Plan, the lead agency must certify that: (a) the Final EIR has been completed in compliance with CEQA; (b) the Final EIR was presented to the decision-making body of the lead agency; and (c) the decision making body reviewed and considered the information in the Final EIR prior to approval (CEQA Guidelines Section 15090).
6. **Lead Agency Project Decision.** The lead agency may: (a) disapprove the project because of its significant environmental effects; (b) require changes to the project to reduce or avoid significant environmental effects; or (c) approve the project despite its significant environmental effects, if the proper findings and statement of overriding considerations are adopted (CEQA Guidelines Sections 15042 and 15043).
7. **Findings/Statement of Overriding Considerations.** For each significant impact of the Campus Master Plan identified in the EIR, the lead agency must find, based on substantial evidence, that either: (a) the Campus Master Plan has been changed to avoid or substantially reduce the magnitude of the impact; (b) changes are within another agency's jurisdiction and such changes have or should be adopted; or (c) specific economic, social, or other considerations make the mitigation measures or project alternatives infeasible (CEQA Guidelines Section 15091). If an agency approves a project with unavoidable significant environmental effects, it must prepare a written Statement of Overriding Considerations that sets forth the specific social, economic, or other reasons supporting the agency's decision.

8. **Notice of Determination (NOD).** The lead agency must file a NOD after deciding to approve a project for which an EIR is prepared (CEQA Guidelines Section 15094). A local agency must file the NOD with the County Clerk. The NOD must be posted for 30 days and sent to anyone previously requesting notice. Posting of the NOD starts a 30-day statute of limitations on CEQA legal challenges (Public Resources Code Section 21167[c]).

## 1.6 Draft EIR Content

This Draft EIR is organized in two volumes (Volumes I and II). Volume I presents the potential project-level environmental impacts of the proposed project, and Volume II provides technical appendices. The contents of Volume I include the following:

- **Executive Summary** – presents a brief synopsis of the proposed project, including project objectives, and an overview of project alternatives. This section also provides a table summarizing project environmental impacts, mitigation measures, and the level of significance of impacts after mitigation.
- **Section 1, Introduction** – provides an overview of the purpose and type of EIR, the EIR process, the intended uses of the EIR, and an overview of the format and contents of the EIR.
- **Section 2, Project Description** – provides a detailed description of the proposed project, including its location, background information, objectives, and physical characteristics.
- **Section 3, Environmental Setting** – provides a general overview of the environmental setting for the proposed project, including the regional setting and the project site setting.
- **Section 4, Environmental Impact Analysis** – presents an analysis of environmental impacts for each environmental factor. Each subsection contains a description of the environmental setting (or existing conditions); identifies the significance criteria used to determine whether impacts would be significant or less than significant; discusses the impacts; describes mitigation measures to reduce significant environmental impacts; and describes cumulative impacts.
- **Section 5, Cumulative Impacts** – provides information required by CEQA regarding cumulative impacts that would result from implementation of the Campus Master Plan together with other present and probably future projects.
- **Section 6 - Other CEQA Considerations** – summarizes impacts that would result from the proposed project, including significant environmental effects, significant and unavoidable environmental effects, irreversible changes to the environment, and growth-inducing impacts.
- **Section 7, Alternatives** – describes potentially feasible alternatives to the proposed project that may attain most of the basic project objectives while avoiding or substantially lessening any of its significant effects. The analysis evaluates the environmental effects resulting from each alternative, compares these effects to those resulting from the proposed project, and describes the relationship of each alternative to the project objectives.
- **Section 8, References** – lists the documents and materials referenced in the text of the document.

Figure 1-1 Environmental Review Process

## 2 Project Description

---

### 2.1 Introduction

California State University, Fullerton (CSUF or University) is one of 23 campuses in the California State University (CSU) system. CSUF consists of eight colleges, including The Arts, Business and Economics, Communications, Education, Engineering and Computer Science, Health and Human Development, Humanities and Social Sciences, and Natural Sciences and Mathematics. In keeping with its state charter and California Education Code 66202.5 and in response to projections of continued increases in demand for higher education enrollment to meet California's future workforce needs, the CSU Board of Trustees (Trustees) has directed each CSU campus to take the necessary steps to accommodate additional systemwide enrollment increases (CSU 2017a, 2019a). To comply with this directive, CSU campuses are required to periodically review and revise their master plans, in part to ensure that proposed capital improvement programs remain consistent with those plans.

This section provides a detailed description of the proposed Campus Master Plan Update, including the project location, major project components, project objectives, and approvals needed for implementation.

### 2.2 Campus Location

#### 2.2.1 CSUF Campus

The campus of CSUF (campus) is located at 800 North State College Boulevard in the City of Fullerton, Orange County, California. The campus is located in the northern portion of Orange County and in the eastern area of the City of Fullerton, about 1,000 feet west of the Placentia city limit, two miles northeast of downtown Fullerton, 3.25 miles northeast of downtown Anaheim. The campus encompasses approximately 240 acres. Figure 2-1 and Figure 2-2 show the campus location. The main campus is bounded by Yorba Linda Boulevard to the north, Nutwood Avenue to the south, State Route 57 (SR 57) (the Orange Freeway) to the east, and North State College Boulevard to the west. Three smaller areas are also part of the campus, including a block which lies on the southern side of Nutwood Avenue, bounded by Langsdorf Drive to the east, College Place to the south, and North Commonwealth Avenue to the west. Additional campus areas are located on the west side of North State College Boulevard, south of Dorothy Lane, north and east of La Vista High School, and north of Yorba Linda Boulevard, east of North State College Boulevard and Almira Avenue.

#### 2.2.2 Surrounding Land Uses

The area surrounding the campus is developed with residential uses, educational institutions, and mixed commercial uses. North of Yorba Linda Boulevard is the private, nonprofit healthcare graduate school Marshal B. Ketchum University, multi-family residential developments, and the Dong Shin Church of China. The campus abuts SR 57 to the east, with multi-family developments located east of SR 57. South of Nutwood Avenue is Hope International University, University Plaza office complex, College Plaza commercial complex, and multi-family residential complexes. West of North State College Boulevard are La Vista High School, Troy High School, and single-family residential neighborhoods. Buildings associated with surrounding uses are generally one to three

stories in height, with a few taller structures such as the church steeple/tower of the Dong Shin Church of China.

## 2.3 Existing Campus Conditions

### 2.3.1 Existing Campus History and Master Plan Background

The CSUF campus was founded in 1957 and officially became part of the CSU system in June 1972 (CSUF 2017). Much of the early campus was designed by Mid-Century modern architects including Howard Van Heuklyn and Thornton Abel, whom envisioned a modern and urban design for the campus. Many of the campus facilities and buildings were originally constructed in the 1960's, with the campus gradually expanding its building footprint through the early 2000's. Today, CSUF is the second largest university in the CSU system (CSU 2019) with total full-time equivalency students (FTES) increasing from 25,000 to 32,000 by 2039 at an increasing rate of one percent annually. The footprint of the campus has accommodated a considerable increase in student enrollment with a number of facilities developed in the last decade.

CSUF has become one of the top two largest universities within the CSU system periodically accommodating the largest FTES enrollment of any of the 23 campuses, since approval of the 2003 Campus Master Plan (2003 Master Plan). The 2003 Master Plan is now outdated and inadequate to accommodate CSUF's continued growing demand. Moreover, CSUF and the City of Fullerton have undergone considerable demographic, economic, political, and social changes within the last decade and a half. The Campus Master Plan provides a framework for managing future campus growth and change, as well as the campus's relationship with the City in a strategic and orderly way.

However, many of the current facilities on campus are inadequate, and the condition and state of infrastructure amongst many of the facilities are overdue for renovations and improvements. The campus has undergone Facility Condition Assessments to determine the current state of facilities on campus. The assessments were conducted in 2018 by Flad Architects, the lead architects for the Campus Master Plan. A Facility Condition Assessment is a method to analyze the condition of facilities based on factors such as age, design, and construction materials. Each facility on the campus has received a Facility Condition Needs Index (FCNI) score to prioritize facility updates based on existing need. The score is calculated by comparing total facility deficiencies to total replacement cost (Emory 2005). The higher the percentage, the higher the degree of deterioration of a facility. A building with an index score less than 10 percent is considered to be in excellent condition, while a building with an index score between 30 and 50 percent is considered to be "below average." Many of CSUF's buildings have received a "below-average" FCNI score, including, but not limited to, Dan Black Hall, Gordon Hall, Humanities-Social Sciences, Clays Performing Arts Center, Pollak Library, Student Health and Counseling Center, and the Titan Student Union. Additionally, a number of buildings have received a designation of Complete Facility Replacement Indicated (CFRI), indicating a FCNI score at or above 60 percent that the building has reached the end of its lifespan. Buildings that have received a CFRI designation include facilities in the visual arts wing, Titan Bookstore, Golleher Alumni House, Education Classroom, and facilities in the Computer Science wing. Figure 2-3 illustrates existing facility conditions on campus.

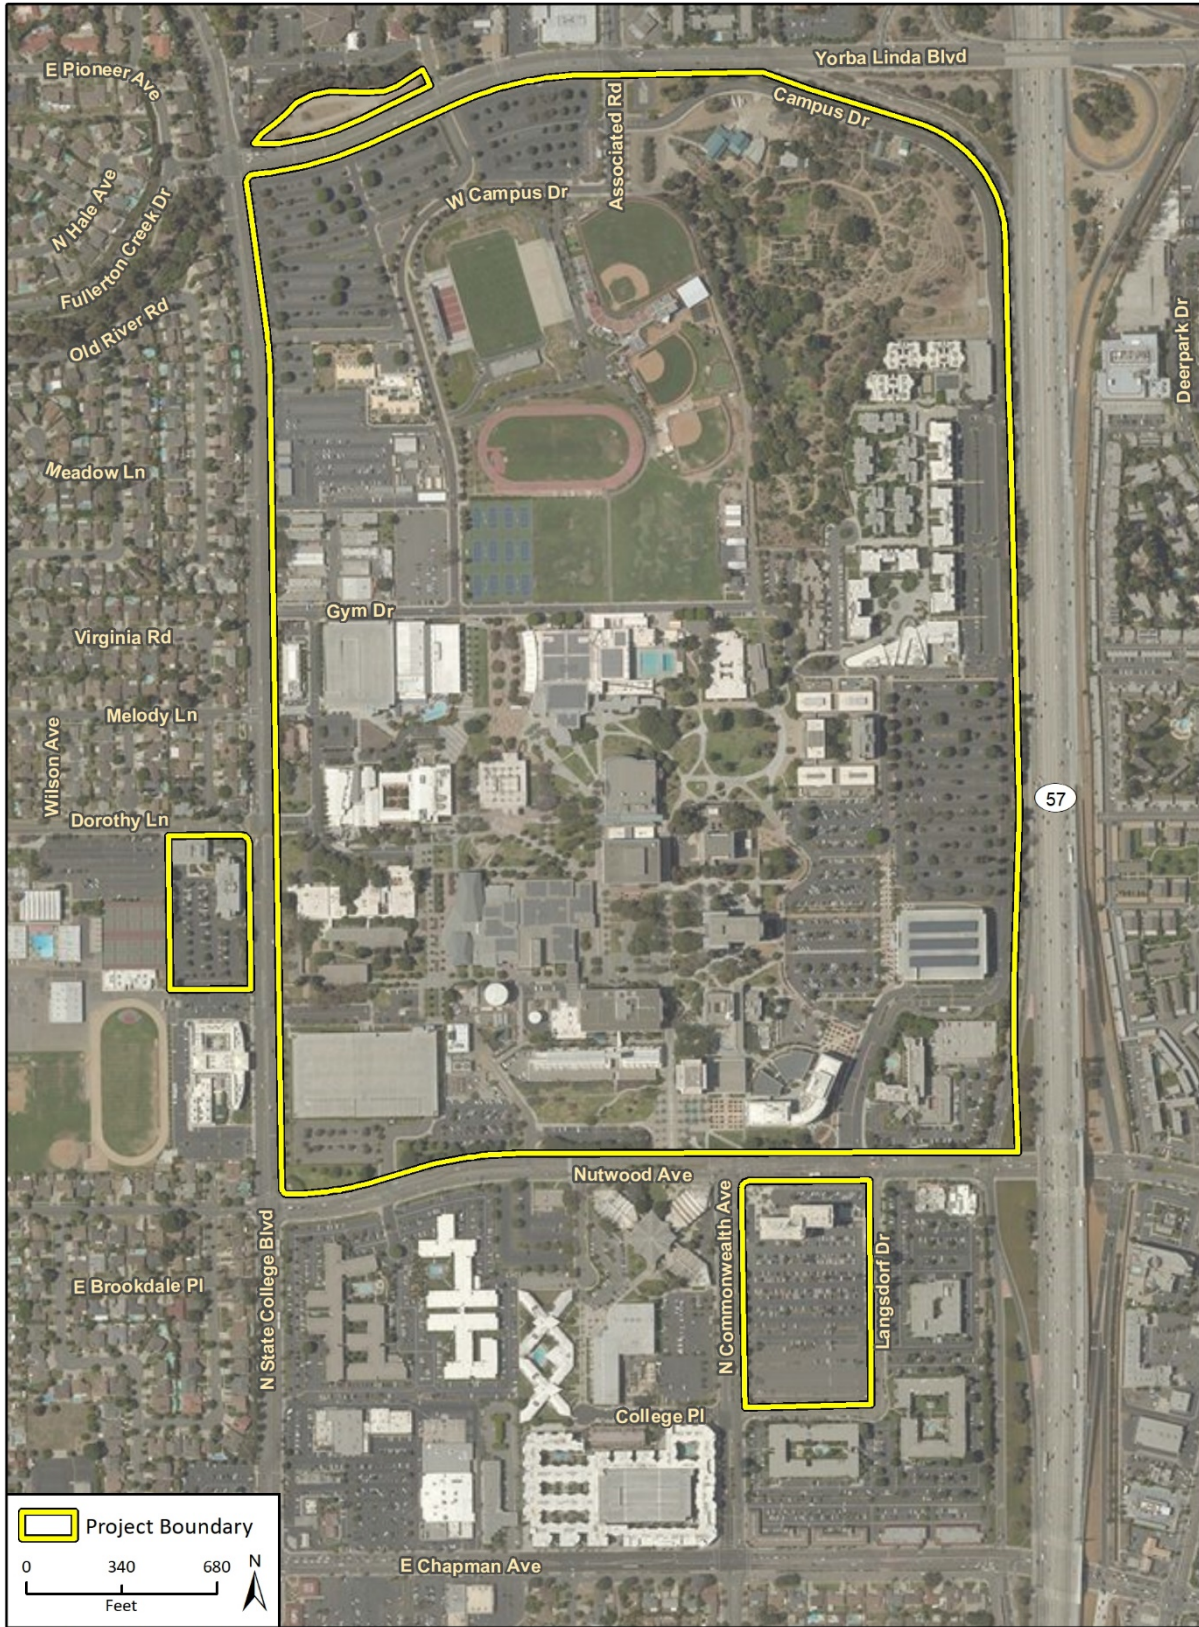

The campus has striven to keep up with the rapid growth that has been occurring over the past decade. CSUF has gradually invested in facilities to improve resources and overall quality of life on campus. Recent structures on campus include three new parking structures, the Mihaylo College of

Figure 2-2 Project Site Location

Business and Economics, the Student Recreation Center, the University Police and Emergency Operations Center and a new residence hall complex that accommodates 1,900 residents. Though these facilities have greatly helped accommodate past growth, CSUF acknowledges a need to continue to invest in and improve on-campus facilities for both students and faculty. The Campus Master Plan will provide a guideline for improving current on-campus facilities while also guiding new construction through 2040. It aims to address the need for improved recreational facilities, additional on campus housing, updated academic buildings and more efficient circulation. Through gradual phased development, the Campus Master Plan strives to improve quality of life and create an enjoyable experience for students, staff, and visitors by facilitating multimodal transit, creating spaces for recreation opportunities, and developing the campus in an environmentally sustainable way.

## 2.3.2 Student Enrollment, Faculty, and Staff: Existing Populations and Projected Growth

### Policies Governing CSU Enrollment Growth

The CSU Board of Trustees requires each CSU campus to have a Campus Master Plan which depicts and explains existing and anticipated facilities necessary to accommodate a specific enrollment target at an estimated target date or planning horizon, in accordance with approved education policies and objectives. CSU negotiates with the State of California annually for funding to support planned enrollment growth each year. The annual State budget identifies anticipated enrollment growth systemwide each year. Following negotiation, CSU allocates enrollment growth funding for California residents according to an enrollment growth target for each CSU campus. Each campus is expected to manage enrollment rates within a small margin of error around the target enrollment rate as they only receive State and CSU funding for the target number. Individual campuses like CSUF establish long-term enrollment goals through the Campus Master Plan process. This sets a future capacity that the campus can work towards and plan for.

### Evolution of Student Enrollment Growth

CSUF has seen steady enrollment growth since it first opened its doors in 1957. In the first decade of CSUF, the school built seven permanent facilities and grew to approximately 9,500 FTES (CSUF 2019b). During the 1970's, enrollment grew by 36 percent and five additional prominent facilities were completed. By the 1980s and 1990s, as the campus expanded, new buildings were constructed primarily on the periphery of the central quad. Housing was constructed in the 1990s along the eastern border of the campus whereas permanent and portable academic buildings essentially "filled in" the periphery of the campus. The 2003 Master Plan increased the enrollment capacity for the campus from 20,000 to 25,000 FTES. The last ten years have displayed exponential growth for CSUF, averaging an increase of 1.2 percent annually with some years, like 2012, reaching five percent. Today, CSUF has approximately 25,000 FTES, and is staffed by 2,151 full and part time faculty and staff. To accommodate student and faculty/staff enrollment growth, there are currently 109 permanent buildings totaling approximately 5.6 million gross square feet (gsf). To date, CSUF has witnessed approximately 254,000 students graduate.

### Projected Growth and Demand

CSUF is ranked sixth in the nation in Bachelor's degrees awarded to minority students. Additionally, the Mihaylo College of Business and Economic is one of the state's largest nationally accredited

undergraduate business programs, and its drama and musical theater programs are all nationally recognized. CSUF has one of the largest applicant pools in the CSUF system and is now considered an impacted campus for all disciplines and majors for first time freshman. As a result, CSUF has had to implement more rigorous standards for applicants. In Fall 2019, the campus accepted only 43 percent of applicants. The Department of Finance's demographic unit anticipates an uptick in graduation rates through the year 2023. Incremental statewide graduation rates combined with the number of transfer applicants from the California Community College system due to The California Promise will result in anticipated increases in student enrollment demand.

The Campus Master Plan sets a new enrollment target of 32,000 FTES, and accounts for future campus development required to accommodate this enrollment target. With the addition of 7,000 students and approximately 1,000 new faculty/staff to support student enrollment growth, additional facilities and resources are strategically implemented in phases through 2039.

### 2.3.3 Existing Campus Conditions

The campus is bisected by Gymnasium Campus Drive and is characterized by a central core of academic buildings in its southern half, with athletic facilities, residential housing, the Fullerton Arboretum, and parking areas primarily located in the northern portion of the campus.

#### **Northern Campus**

The northern portion of the campus consists mainly of the Arboretum, athletic facilities, student housing, the Child Development Center, and buildings for support services such as the Corporation Yard.

The 26-acre Arboretum, located in the northeastern portion of campus (shown on Figure 2-2), serves as a regional resource for research, recreation, education, and agricultural heritage. The Arboretum is accessed from West Campus Drive and North Campus Drive off Yorba Linda Boulevard, and is bounded by Folino Drive to the north, SR 57 to the east, a campus bicycle path and athletic fields to the west, and student residential housing to the south. The Arboretum is open to the public and contains waterfalls, ponds, trails, and plant collections. The Arboretum is one of only 21 arboretums in the world to be awarded Level IV accreditation for its plant collection and educational value. The Arboretum includes a visitor center, Heritage House historic building, plant nursery, and garden sale area. CSUF students use the space to complete research projects, and the Arboretum is also used for K-12 education and community programs.

The Arboretum began in a field of the region's iconic orange groves, and officially opened to the public in 1979. On March 24, 1976, a Joint Exercise Powers Agreement (JPA) was created between the Redevelopment Agency of the City of Fullerton and the Trustees creating an agency to be known as the Arboretum Authority. Part of the CSUF's contribution to the JPA was to grant the Arboretum Authority use of University owned land. In 1977, the Authority entered into a Site Lease with the University. The JPA is set to terminate in December 2020, with the Arboretum Authority maintaining responsibility for the living collections and the historic collections through December 3, 2020. At that time management and operation of the Arboretum will fall back to CSUF, who will administer the facility through CSUF Extension and International Programs (CSUF 2019b).

Most of CSUF's athletic program facilities are also located in the northern half of the campus. CSUF competes in 10 different sports, overseen by the Athletic Department. Athletic facilities consist of Titan Stadium, Goodwin Field, Anderson Family Field, and the Titan Sports Complex. Many of the athletic facilities are bordered by West Campus Drive, operations service buildings and paved

parking lots to the north and west, Gymnasium Campus Drive to the south, and the Arboretum and student housing to the east.

Most of CSUF's on-campus student housing is in the northern half of the campus. Residence halls are the most common type of on-campus housing for first-year students. Bedrooms in the residence halls are approximately 12 feet wide by 11 feet long and fit two or three twin extra-long beds. Each bedroom is equipped with closets, a dresser and a desk. Bedrooms in residence halls are clustered around community bathrooms, activity rooms, and study rooms. There are six meeting rooms located on the lobby floor of each residence hall. Additionally, the residence halls have access to a computer lab located in the Academic Resource Center, a fitness room located on the lobby of Cypress Hall, laundry rooms located in Cypress Hall and Juniper Hall, and a multipurpose room located in Cypress Hall. CSUF's residence halls are built with sustainable materials and incorporate sustainable components. Currently, there are approximately 2,000 student beds on campus and six faculty and staff beds.

As indicated in Figure 2-4, campus residence halls center around The Gastronome, the primary dining hall for on-campus residents. Students obtain a meal plan when registering for on-campus housing and have access to campus dining. Additionally, the Community Market and Late Night Café, both located adjacent to The Gastronome, offer quick grab-and-go dining options.

## Southern Campus

The southern portion of the campus is located south of Gymnasium Campus Drive. The southern portion of campus consists mainly of academic buildings, student support services, campus recreation facilities, and parking lots and structures. Academic buildings include Kinesiology and Health Sciences, Steven G. Mihaylo Hall, College of Humanities and Social Sciences, Pollak Library, Student Health and Counselor Services, Clayes Performing Arts Center, Education Classroom, Dan Black Hall, Langsdorf Hall, Gordon Hall, McCarthy Hall, Engineering, and Computer Science. Buildings are set among outdoor areas landscaped with lawns and other ornamental vegetation.

Student support and recreational facilities in the southern portion of campus include the Titan Bookstore, Titan Student Union, and the Student Recreation Center. The Titan Student Union serves as the primary gathering place for the campus community and includes event space, student art galleries, Titan Bowl & Billiards, a food court, automated teller machines, and ticket sales. The Student Recreation Center is available for both students and faculty and includes a full gym, basketball courts, a swimming pool, rock wall, private rooms for group exercise classes, and a children's center. Both the Titan Student Union and the Student Recreation Center are located on the western side campus east of Student Union Drive and west of Titan Walk.

Additionally, the campus quad, also known as The Piazza, marks the heart of the southern half of campus, or the campus core, as many of the academic buildings are strategically centered around the quad. The quad serves as an outdoor recreation and relaxation space for both students and faculty and consists of outdoor seating, speakers, and landscaping for student and faculty relaxation and enjoyment. Figure 2-5 illustrates the general layout of land uses on campus and Figure 2-6 through Figure 2-23 show photos of select campus facilities.

### 2.3.4 Existing Campus Access, Circulation, and Parking

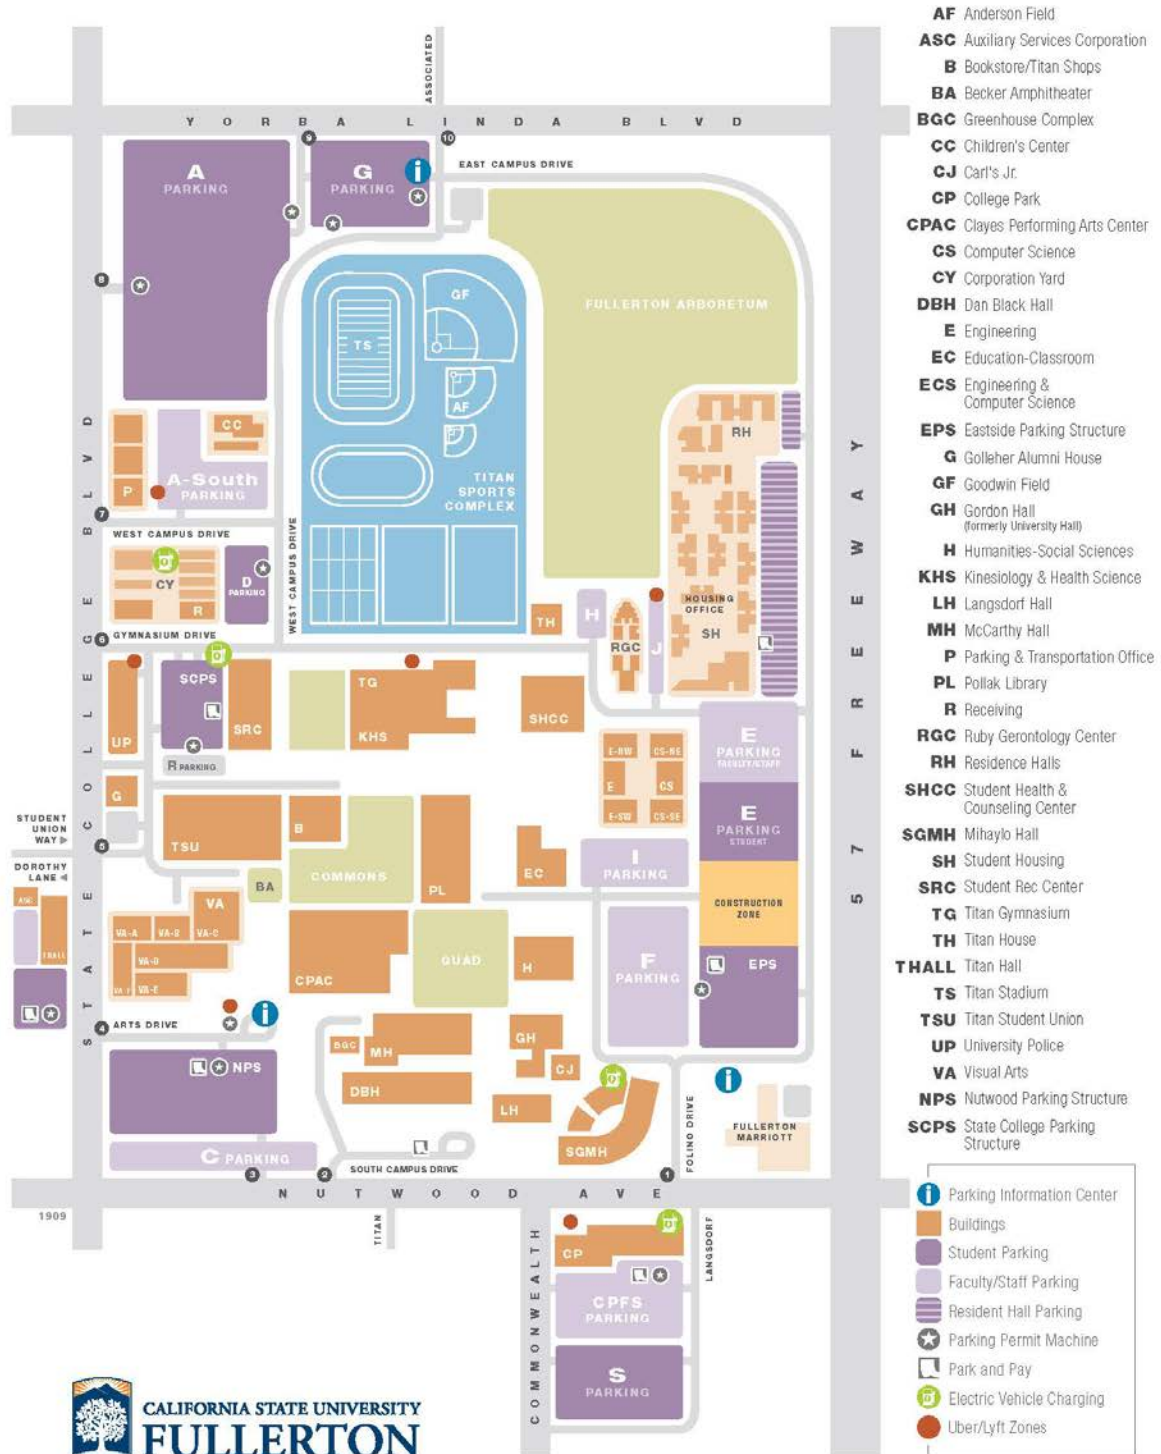

There are ten points of vehicular access to the main CSUF campus along Yorba Linda Boulevard, North State College Boulevard, and Nutwood Avenue. The eastern edge of campus runs parallel to SR 57, prohibiting access to the campus from the east. Figure 2-24 illustrates the access points and parking areas on campus. There are two access points on the northern edge of campus (Access Points 9 and 10), five access points on the western portion of campus (Access Points 4, 5, 6, 7, and 8) and three access points on the southern edge of campus (Access Points 1, 2, and 3). Access Points 8, 9 and 10 lead to student parking lots A and G. Access Point 7 leads to the staff parking lot A-South. Access Points 5 and 6 primarily lead into campus for pick-ups and turnarounds. Access Point 4 leads to the student Nutwood Parking Structure. Access Point 3 leads to the Staff Parking Lot C. Access Points 1 and 2 lead into campus with Access Point 1 also leading to parking lots and structures located on the east side of campus. The campus layout is designed to serve students who commute to and from the campus. Building layout was planned so that walking time between classes does not exceed ten minutes. Bicycle and pedestrian paths are webbed throughout campus, with bike racks and additional infrastructure provided for students to secure personal methods of transportation. Main academic and administrative functions are in the center of campus, while vehicular circulation, parking lots, and parking structures are located around the periphery.

On-campus parking for students and faculty is available via parking permit or a daily parking fee. The northern portion of campus contains several paved parking lots (Lots A, G, D, H, J and residential parking located adjacent to the housing). The southern portion of campus contains Lots R, C, F, I, and E and the University's three main parking structures: North State College Parking Structure in the western portion of campus just south of Gymnasium Drive, Nutwood Parking Structure in the southwest corner of campus near North State College Boulevard and Nutwood Avenue, and the most recent parking structure, Eastside Parking Structure in the southeast corner of campus and accessed via Folino Drive off Nutwood Avenue. The current total number of on-campus parking spaces is 12,340. Additionally, off-site parking is available for students and faculty at the EvFree Church at East Bastanchury Road and South Brea Boulevard. CSUF provides a shuttle from the EvFree Church to the campus which runs every 10 to 15 minutes.

In addition to on and off-campus parking, CSUF includes several alternative methods of transportation. The CSUF Bike Program encourages students to use designated bike paths to commute to and travel within the campus. Through the program, students can receive free bike safety checks as well as discounts on new bicycles and bicycle parts. The CSUF Bus Pass (U-Pass) program allows students to ride on all local Orange County Transportation Authority (OCTA) routes for a highly discounted rate. The Amtrak and Metrolink rail station is approximately 2.25 miles southwest of campus in downtown Fullerton and student discounts are available on rail fare. In addition, CSUF recently initiated the Zipcar CarShare program, which offers students temporary access to campus vehicles for students who don't have access to a personal vehicle.

Figure 2-24 Existing Campus Access and Parking

## 2.4 Project Objectives

The underlying purpose of the Campus Master Plan is to support the University's Academic Master Plan and the CSU's Graduation 2025 Initiative by guiding physical campus development through the year 2039 in ways that support anticipated enrollment growth and changes in pedagogy, academic and support programs, energy supplies and use, utility infrastructure, and transportation. CSUF's commitment to its students is underlined in the Campus Master Plan through the inclusion of the following overarching goals:

- Serve the future of society by providing a robust and relevant education.
- Improve graduation rates.
- Support problem-based learning.
- Promote research as learning and basic research as vital components of this knowledge-based community.
- Promote cross-discipline collaboration.
- Increase quality student/professional interaction.
- Build community connection and support.

The following objectives of the Campus Master Plan have been established in support of its underlying purpose:

- Enable the university to accommodate incremental planned enrollment growth in the future as required by the CSU.
- Construct new academic facilities that can house programs to fulfill the pedagogic needs of the future and contribute to meeting demand created by planned enrollment growth.
- Improve the connectivity and cohesion of physical spaces on campus and with improved linkages to Downtown Fullerton and public transit.
- Enable the campus to function as a 24-hour hub for student life through increased building density with amenities and access to goods and services in the campus core, the addition of student beds, informal and after-hours work spaces for students, and improved nighttime security.
- Restore the Green Loop that circumnavigates the campus to better function as an organizing feature for academic facilities and open space.
- Increase the density of academic facilities in the campus core to support program growth and change and enable cross-disciplinary collaboration in a space-efficient manner.
- Develop an Innovation Hub that allows students to experiment with processes and prototypes for the future, to serve all sectors of society.
- Establish an event center on campus for daily use by the entire campus community.
- As the campus resumes primary responsibility for management of the Arboretum, balance preservation of its natural and historic resources, protection of its function as a place of solitude and reflection for campus and community members, and enhancement of its use for academic purposes.

- Provide an additional 2,400,000<sup>1</sup> student beds and a range of residential options and associated amenities on campus, to support improved rates of retention and graduation for freshman and other students.
- Provide 350 units of faculty housing.
- Improve alternative, multimodal access to campus and reduce reliance on personal vehicle use and parking demand.
- Replace and improve storm management infrastructure to reduce the incidence of flooding.
- Incorporate resilience into the Campus Master Plan through emergency management planning and established locations for emergency operation centers and material storage.

## 2.5 Project Characteristics

The Campus Master Plan is a guide for the future development of the CSUF campus and is an update of the 2003 Master Plan. CSUF certified an Environmental Impact Report (EIR) for the 2003 Master Plan in August 2003. Figure 2-25 and Figure 2-26 illustrate the Campus Master Plan facilities plan, including proposed renovation and development.

According to the CSUF Division of Academic Affairs, CSUF reached the 25,000 on-campus FTES ceiling in the 2016-2017 academic year. The Campus Master Plan is designed to accommodate a 32,000 FTES ceiling through the year 2040, representing an increase of 5,000 FTES (20 percent) enrolled on the main campus. This ceiling would result from growth rate of 357 FTES per year, or a one percent annual increase. These FTES increases are based on anticipated future demand for CSUF's services. The Campus Master Plan would accommodate, not cause, these projected FTES increases, which are projected to occur with or without implementation of the Campus Master Plan. Expected FTES by four-year increments is shown in Table 2-1.

**Table 2-1 CSUF Expected Enrollment (FTES)**

2018	2022	2026	2030	2034	2038	2039
25,911	26,963	28,057	29,197	30,382	31,616	31,932

Notes: FTES calculated estimating a one percent growth rate

Source: Flad Architects, October 17, 2018

The Campus Master Plan is a strategy for modifying the physical campus of CSUF to accommodate expected growth and presents an overall picture of the future of the CSUF campus. The Campus Master Plan includes recommendations for land use, construction, enhancement and replacement of existing facilities, mobility networks, and sustainable practices. The land use plan included in the Campus Master Plan enables continuity between campus land uses which currently have distinct delineations, such as areas devoted to Academic, Athletics, and the Arboretum. The Campus Master Plan would replace facilities in need of demolition and add new facilities that would provide academic, housing, and recreational uses to support the anticipated increase in FTES and

<sup>1</sup> Approximately 600 of the proposed 3,000 student housing beds were evaluated under the 2003 Master Plan and are the subject of separate environmental review. These beds are included in this discussion as they have not yet been constructed and are a part of the projected 3,000 additional student beds accommodated under the Campus Master Plan.

faculty/staff. These renovations and additions would increase informal learning spaces and improve dining and campus living amenities for the campus population.

To achieve the project objectives, the Campus Master Plan would replace and renovate several facilities including the Health Sciences building, Titan Bookstore, Education Classroom building, the single-level engineering buildings, visual arts buildings, anthropology storage facilities, the Goodwin Field Press Box, and the corporation yard/management facilities. In addition, the Campus Master Plan proposes to add additional student housing (approximately 3,000<sup>2</sup> beds) and new campus amenities including a recreation center, student building, wellness center, and student success center. Furthermore, there would be the addition of faculty housing along with living learning communities (LLCs), retail space, an innovation center, an event center with a capacity of 6,000 people, mobility hubs, and parking structure(s). These new and updated facilities would provide more opportunities for students to live and work on campus, reduce the need for single-occupancy vehicles and make the overall campus more accessible to commuter and non-commuter students.

## 2.5.1 Campus Districts

CSUF is seeking to create a dynamic campus with daytime, evening, and weekend activities by applying urban design techniques that support vibrant and cohesive districts. The Campus Master Plan identifies three primary districts within the campus: the Events and Innovation District, the Mobility Hub and Entrance District, and the Residential and Student Life District. Figure 2-27 illustrates the approximate locations of these three proposed districts.

### Residential and Student Life District

The Residential and Student Life District would be in the northern area of campus and would create a welcoming environment for on-campus student housing. New student residence buildings would be developed in this district, and one building in the district would be entirely dedicated to student amenities to provide non-academic spaces for student programming and recreation.

Recommendations for this area are:

- Develop clear pedestrian pathways between student housing, the student union, and the Green Loop
- Include courtyards that support adjacent uses and provide a semi-private public realm
- Utilize versatile landscaping for informal recreation and gathering opportunities

### Events and Innovation District

The Events and Innovation District would be centered on the proposed 6,000-seat Event Center and the Innovation Hub. The goal of this district is to become the counterpart of the student Residential and Student Life District in order to draw students from other parts of campus. Recommendations for this district include:

- Establish a café in the events plaza on the ground floor
- Create clear pedestrian pathways between the Performance Center, Event Center, and Innovation Hub

---

<sup>2</sup> Approximately 600 of the proposed 3,000 student housing beds were evaluated under the 2003 Master Plan and are the subject of separate environmental review. These beds are included in this discussion as they have not yet been constructed and are a part of the projected 3,000 additional student beds accommodated under the Campus Master Plan.

- Place art at strategic nodes
- Maintain landscaping that creates a central outdoor space for the district
- Include a retail space in the Innovation Hub
- Create clear pedestrian pathways to on-campus housing

### **Mobility Hub and Entrance District**

The Mobility Hub and Innovation District would promote campus identity and increase activation of space on campus. This district would enhance existing campus entrance points and proposed mobility hubs to create places function as enjoyable places to linger and learn. Recommendations for this district include:

- Establish wayfinding information such as signage, pavers, and other physical cues
- Provide pedestrian connections from all main entrances to the Green Loop
- Place art at strategic nodes
- Incorporate outdoor seating into placemaking design
- Place a café or food access near main entrances

### **2.5.2 Academic Facilities**

The Campus Master Plan proposes to add approximately 881,526 gsf of additional academic space. There are 16 academic buildings identified in the Campus Master Plan that would undergo renovations or total replacement. New academic buildings identified in the Campus Master Plan would not be associated with a certain department or discipline to allow for flexibility of uses. CSUF acknowledges the importance of preserving and expanding open space and non-academic facilities. Therefore, academic buildings would be infill development within the existing campus footprint and six stories in height. Academic buildings would be designed with opportunities for student life spaces on the lobby of each academic space, creating informal learning spaces outside of the classroom for student study sessions, meetings with faculty, and individual study sessions. Additionally, cafés and other student life spaces would provide opportunities for student and faculty connection and rapport.

Additional buildings proposed in the Campus Master Plan to enhance academic success are the Innovation Hub, Event Center, and new facilities in the Arboretum. Although not part of the academic entitled space, the Innovation Hub would support multi-disciplinary learning and academic success. The Innovation Hub has three primary goals: Promoting Multi-Disciplinary Learning; Fostering Industry Partnership; and Driving Entrepreneurship. The Innovation Hub would include spaces such as lecture or large group rooms, maker-spaces, computer labs, rooms for club meetings, study rooms, and meeting rooms for students and faculty to meet with members of the business community. The Innovation Hub would be equipped with state-of-the-art technology and would support economic development for the campus and greater community. The Event Center would be a vital addition to the campus and used to support sporting events, concerts, graduation events and job fairs, and would be available for use by the campus population and broader community. Located near the academic core, the Event Center would include an outdoor event plaza located near public transportation hubs. Additionally, programmatic changes proposed for the Arboretum would support academic success.

### 2.5.3 Residential and Student Life Facilities

The Campus Master Plan proposes additional on-campus housing for students and faculty/staff for several reasons. CSUF desires to create an active campus 24-hour a day, seven days a week, which would be accomplished by developing additional on-campus housing and related amenities. Additionally, housing near campus has been identified as a challenge for faculty and staff considering employment at CSUF. Providing additional housing on campus would ultimately improve retention and graduation rates by removing commuting barriers, allowing for more flexibility for staff/faculty, and extending hours for more learning and participation in student programming, study groups, and overall collaboration.

#### LEGEND

Existing Facility / Proposed Facility

NOTE: Existing building numbers correspond with building numbers in the Space and Facilities Data Base (SFDB)

Figure 2-26 Campus Map

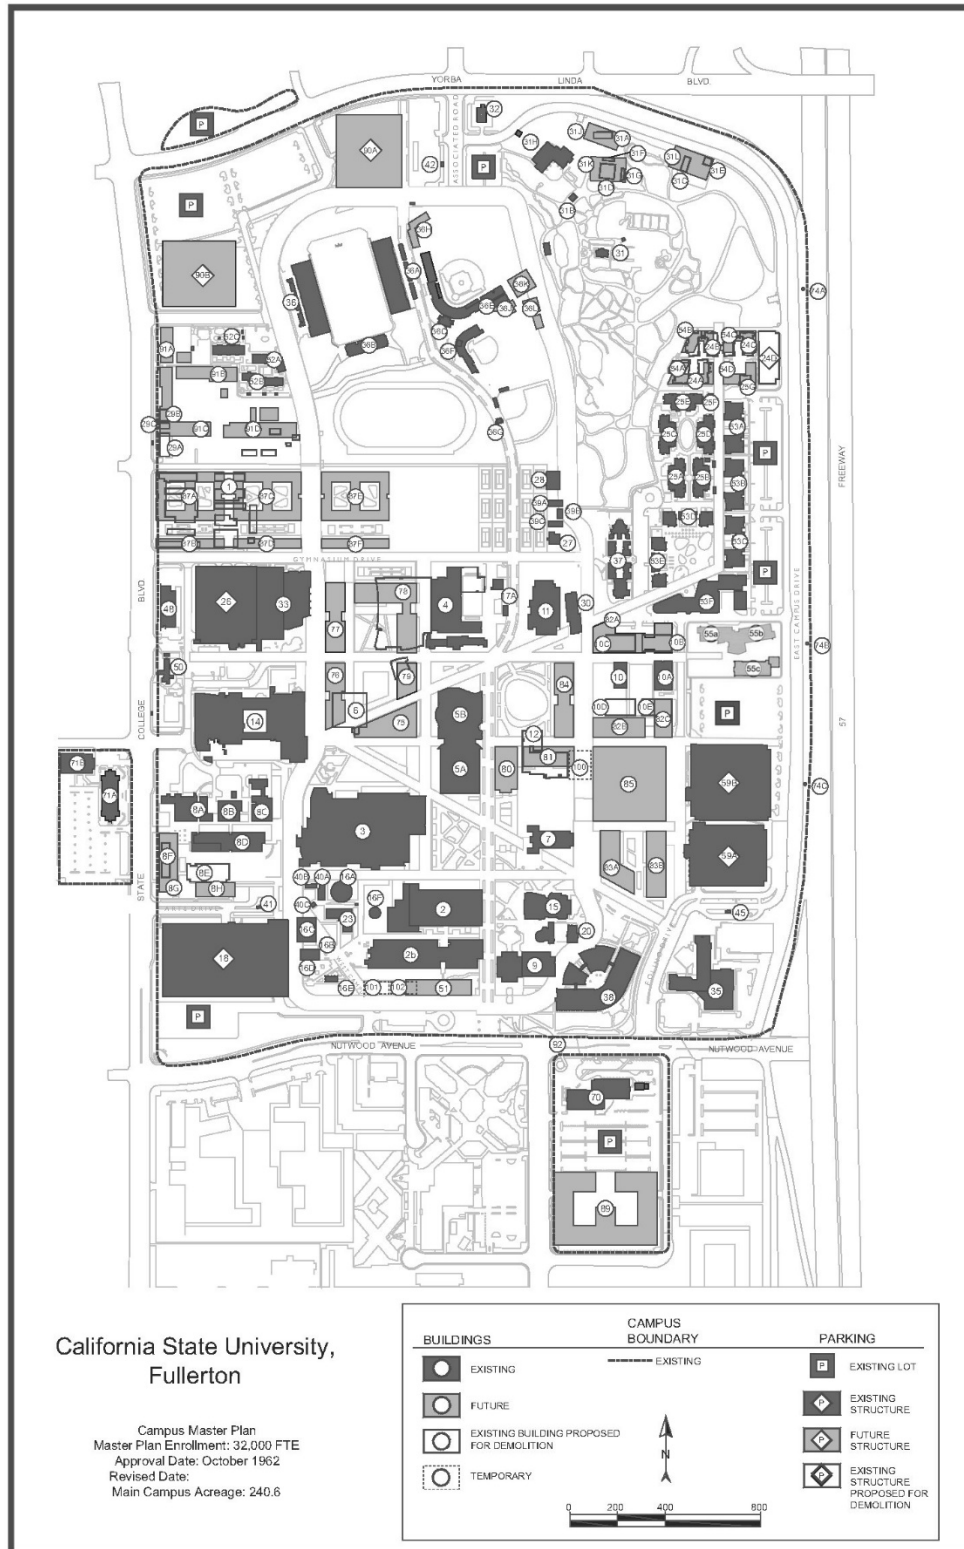

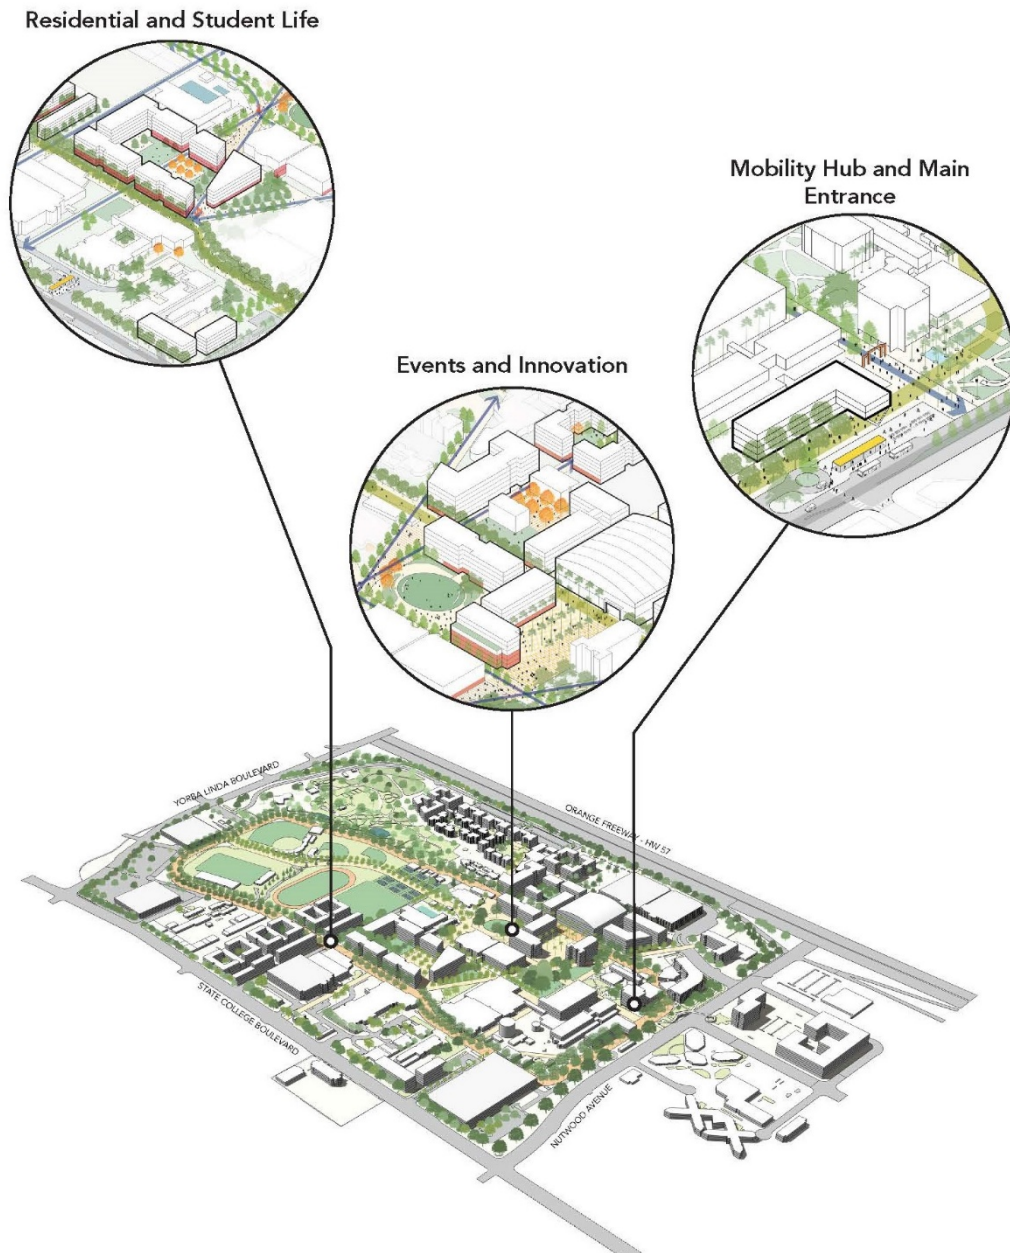

Figure 2-27 Campus Districts

The Campus Master Plan proposes an additional 803,880 gsf of on-campus student housing (approximately 3,000 beds) and an additional 539,000 gsf (approximately 350 beds) of on-campus faculty/staff housing. Of the 3,000 student beds, 600 are part of a separate project subject to separate environmental review, not included in the Campus Master Plan and are not analyzed in this EIR. These beds are included in this discussion as they have not yet been constructed and are a part of the projected 3,000 additional student beds accommodated under the Campus Master Plan. Student housing would be built in three clusters; two clusters would be built next to the existing residence halls located on the west side of campus, and one cluster would be constructed on the western side of the campus to increase student activity in this area. The faculty/staff housing complex would be located south of Nutwood Avenue by the existing College Park building.

The development of on-campus student housing would be centered around four primary considerations. First, student housing would include space for student life programming, specifically on main floor, for students to hang out, meet, socialize, study, relax, and recreate. Second, housing would be complimented by student amenities too support an all-day campus environment, such as cafes, dining halls, quick grab-and-go food counters, and small convenience stores. Third, amenities would be provided in various locations across campus to support commuting students and encouraging them to remain on campus to take advantage of non-academic activities and programs. Lastly, all housing, related amenities, and student spaces would be visible, safe, and accessible.

#### 2.5.4 Athletic and Recreational Facilities

Athletic and recreational facilities proposed in the Campus Master Plan include the Event Center, the Green Loop, and recreational areas in and around the on-campus residence halls. The Campus Master Plan proposes a 6,000 seat Event Center to create a campus life forecourt that lends itself to community recreational activities such as athletic sporting events, intramural sports programs, concerts, plays, fairs, and other recreational activities for both CSUF and the surrounding community.

In addition to the Event Center, the Campus Master Plan emphasizes the incorporation of green space and outdoor open space throughout campus to facilitate recreational activities. Open spaces such as lawns and shaded courtyards would be incorporated around the campus to encourage student engagement in informal recreational activities as well as gathering and studying. Open spaces would also be used for student programming such as displays, fairs, celebrations, and art installations.

The Green Loop would deliberately and thoughtfully connect each campus district as a space for recreation and active transportation such as biking, walking, and jogging. The Campus Master Plan would also incorporate green space adjacent to student residence halls to provide space for student recreational activities opportunities and relaxation.

#### 2.5.5 Design Characteristics

The design principles included in the Campus Master Plan reflect modern principles that can adequately provide a framework for future development. The architectural aesthetic directed by the design guidelines would create a cohesive campus identity that would also generate a comfortable, pedestrian-friendly environment. For example, the design guidelines would direct building massing would be articulated to create a comfortable relationship between the scale of a person and the scale of the building. Existing campus buildings accomplish a pedestrian-scale through the building's architectural or structural expression rather than applied decoration, and building elevations are

brought into pedestrian scale using more articulated or open ground floor elevations. New buildings should employ architectural articulation to create visual interest, incorporate surface effects in ways that are consistent with existing adjacent structures, and consider changes in material, color, or other architectural features to visually articulate or activate a building elevation.

Existing campus building façade materials are predominantly concrete, although metal panels, plaster, brick, and/or curtain wall systems are occasionally employed. The existing palette of materials can be augmented to create visual interest. Building material and color choices for proposed buildings would harmonize with existing campus palettes. Foreground buildings may employ materials and colors that create a distinct identity and distinguish them from other buildings on campus, as is appropriate for their functions.

The Campus Master Plan identifies five frameworks that would act as major drivers for campus organization and development:

- **Green Loop:** The Green Loop provides deliberate and thoughtful connection and organization around and through each part of the campus. These connections are activated by the path of the loop itself – with opportunities for various forms of active transportation such as walking, running, skating, scooting and biking – and by inserting programmatic learning opportunities along the path, which would provide visual orientation and a sense of identity in each campus district.
- **Axes:** Axes are cross-campus pedestrian/bicycle circulation paths that are linear and cut across and beyond the Green Loop. Axes provide several clear north-south and east-west connections and two diagonal pathways. Axes engage with the Green Loop at node points. These paths offer more direct access to various campus zones, and paired with the Green Loop, contribute to a network of walkable and bikeable access routes throughout the campus.
- **Height and Density:** The need to accommodate enrollment growth and increased demands on academic space while maintaining open space and a livable and functional campus has presented the opportunity to revisit mass and density on the campus. Considering the highest and best use for campus land has resulted in planning for growth to include new buildings up to seven stories in height.
- **Ground Floor Activation:** Being able to readily identify building functions and internal activities helps to orient the campus user and creates a clear and safe path and sense of arrival at each destination. This should be achieved by programming student-life functions at ground levels and by designing for transparency at the ground floor, creating “front porches” at each building. Entrances should be oriented toward and visible from circulation paths and should be well-lit, inviting spaces that are programmed for group study or socializing. They may provide café functions or other opportunities for students and others to congregate.
- **Campus Circulation:** In the campus core, walking is the primary mode, with scooters, skateboards, and campus carts permissible. Biking, while not explicitly designed for in the inner core is permitted with the exception of dismount zones. Vehicle access (along with all other modes) is permitted around the perimeter of campus. All parking is located in this outermost area, with only minimal access to more inner parts of campus. Other components of the campus circulation strategy include perimeter circulation and connection points to the surrounding community. Perimeter points are entry places where commuters or visitors enter campus via buses, cars, bikes, or skateboards and continue to the core of campus on foot.

## 2.5.6 Sustainability

The Campus Master Plan aims to uphold the CSU Sustainability Policy throughout its lifespan. The CSU Sustainability Policy aims to integrate sustainability into the academic curriculum, develop employee and student workforce skills in the “green jobs” sector, and pursue sustainable practices on university campuses in business operations, facilities operations, food services, and design and construction.

With an increasing presence in the CSU system and community at large, CSUF recognizes the importance of being a leader in sustainability. The campus has maintained a high level of commitment to create a more resilient and sustainable campus community. CSUF has established and implemented a wide variety of sustainable practices regarding energy efficiency, water efficiency, waste diversion and reduction, and transportation. The University has achieved a high level of energy efficiency through its on-campus 4.6 megawatt (MW) trigeneration plan, resulting in the campus being able to meet approximately 70 percent of its energy needs. Additional sustainable practices include the robust use of solar power on campus, the switch from campus landscaping to drought tolerant plants, and the investment of higher efficiency energy and water meters.

The Campus Master Plan contains goals and policies to realize a more sustainable and resilient future. A primary goal of the Campus Master Plan is to maintain the current campus footprint through the principles of compact development and sustainable design. The campus was the first in the CSU system to obtain a Leadership in Energy and Environmental Design (LEED) Platinum Certification for a student housing complex by the United States Green Building Council (USGBC). The campus would continue to follow best practices for green building design for newly built and renovated buildings. Additionally, Campus Master Plan aims to reduce the need for transportation by increasing on-campus housing and student amenities and implementing alternative transportation options and programs identified in the University’s transportation demand management (TDM) plan. The Campus Master Plan aligns with current CSUF initiatives for conscientious decision-making at both the administrative and student level.

Development of a resilient campus will be supported by the following measures:

- The creation of a 24-hour community
- The expansion of food options on campus
- A shift to multi-modal mobility
- The designation of critical buildings and infrastructure
- A shift to adaptive landscape elements
- The expansion of on-site electricity generation and the creation of a microgrid

Utility resiliency:

- Seismic restraints and retrofit for applicable MEP equipment, including Central Utility Plant and Thermal Energy Storage Tanks.
- Location of critical building MEP systems above flood plain

## 2.5.7 Open Space

There are four different types of open space included in the proposed Campus Master Plan: (1) contemplative outdoor space, (2) learning courtyard, (3) event space and innovation hub, and

(4) quads. Contemplative outdoor spaces would consist mainly of the Arboretum on the north side of campus. There would be additional contemplative outdoor spaces scattered throughout campus, primarily on the west side of campus near proposed residential housing. Learning courtyards would focus in the center of campus near academic facilities. Three on-campus learning courtyards are proposed in the Campus Master Plan. Event space and innovation hub functions more as an interactive creative space where students and faculty can think freely and exchange ideas. One main event space and innovation hub is proposed near the current Humanities-Social Sciences building and Education Classroom. Two quads are proposed as part of the Campus Master Plan including one designated quad space, and additional quad space on the Titan Lawn.

In addition, 26 acres of the campus comprise the Arboretum, the largest open space on campus. It consists of several “lakes,” ponds, and plant collections, providing opportunity for people to both recreate and conduct research. The major existing features of the Arboretum would remain following implementation of the Campus Master Plan. Figure 2-28 illustrates proposed on-campus open space.

### 2.5.8 Utilities and Infrastructure

The proposed project would require the installation of additional water main lines, lateral connections, and hydrants within the campus to serve planned facilities. The campus currently has a combined firewater and domestic water system. The Campus Master Plan would involve the replacement of several high-risk water pipes that are made out of asbestos material. Additionally, several pipes were found to be running at full capacity. The addition of new campus facilities would require additional pipes and water lines to service water for both fire and domestic uses.

Wastewater within the campus is currently served by three public sanitary sewer mains that run along Yorba Linda Boulevard, North State College Boulevard, and East Nutwood Avenue. Many portions of the sewer mains are considered high risk due to root intrusion, pipe cracking, and increases in sewage level due to displacement in pipes. Existing buildings that will be demolished and replaced are currently generating approximately 207,152 gallons per day (GPD) of wastewater. Proposed facilities in the Campus Master Plan would generate approximately 1,528,572 GPD. This would result in a net increase of approximately 1,321,420 GPD of wastewater. Four out of the seven sewer pipes that run through campus would require upsizing to accommodate additional capacity. Certain proposed facilities conflict with existing campus sewer lines which would be demolished and relocated. Additional analysis for these facilities would be conducted. Proposed parking structures within the Campus Master Plan would not generate wastewater.

Stormwater within the campus is currently managed through three storm drain hard pipe connections that run from campus to city main lines. The current pipes are flowing under pressure and are flowing past 100 percent full in the event of a two-year storm. Many of the pipes are undersized and at inadequate slopes. Certain areas of campus, such as the athletic fields and areas west of the Pollack Library are notable flood areas. To alleviate stress on current stormwater infrastructure, the Campus Master Plan includes on-site post construction Low Impact Design (LID) and best management practices (BMP). Structural BMP's would mitigate impacts of runoff and stormwater pollution close to the source. Strategies include infiltration systems, stormwater capture and use, and high efficiency biofiltration/bioretenion systems.

The campus supply of natural gas is derived from Southern California Gas (SCG) which currently delivers natural gas to campus through three major lines. CSUF privately distributes medium pressure gas throughout the campus. Current natural gas lines are outdated, have inadequate isolation valves, and some are missing earthquake valves. The campus is aiming to reduce its fossil

fuel use. However, natural gas infrastructure is still expected to be in need of repair. Replacement of old pipes, installation of more strategic isolation valves, and installation of earthquake valves to other buildings would be near-term, natural gas infrastructure upgrades within the campus. New service points and additional meter locations would make natural gas delivery, maintenance, and monitoring more efficient.

Figure 2-28 Proposed Open Space

## 2.5.9 Access, Circulation, and Parking

CSUF's site access and vehicular circulation plan is shown in Figure 2-29 and would not change with the updated Campus Master Plan. Current circulation within the campus would remain in its current state, with the exception of expanding bicycle access on existing campus pathways. Yorba Linda Boulevard, North State College Boulevard and Nutwood Avenue would remain the primary arterials and access points around campus. No new access points from these arterials would be constructed as part of the updated Campus Master Plan.

The University acknowledges a high demand of parking for both students and faculty. The 2019 Campus Master Plan would count for an increase in student enrollment, building square footage on campus, and additional amenities needed to support these increases, including parking. The increase of FTES, staff and on-campus housing would require the addition of parking spaces on the project site. The Campus Master Plan has assumed the addition of 3,000 new student beds, 1,000~~99~~ new faculty/staff, and an increase in the total number of FTES to 32,000. Increases in both the number of student beds and faculty and staff would result in the need for 4,473 additional parking spaces. Two additional parking structures, totaling 1,677,374 gsf, have been proposed to help reduce the number of needed on-campus parking. However, a deficit of parking would remain and need to be addressed through alternative methods of transportation such as the campus subsidized transit program, the ridesharing program and taking advantage of campus pedestrian and bicycle services.

To help offset the high demand parking spaces, the Campus Master Plan includes a comprehensive TDM program. The TDM program aims to relieve some of the high demand for parking spaces, reduce single-occupancy vehicle trips to and from campus, and encourage students and faculty commuting to and from campus to use more efficient and sustainable methods of transportation. To do this, CSUF plans to expand and implement programs including a ridesharing program, a subsidized transit program, a shuttle to downtown Fullerton and the Fullerton Metrolink Station, and a market rate parking pricing program. Implementation of the TDM program would ultimately result in a reduced parking demand and a reduction in greenhouse gas (GHG) emissions associated with vehicle trips. Additionally, implementation of the TDM program would help increase connectivity between campus and the surrounding community, reducing the need for vehicles in order to make these connections. Figure 2-30 shows the proposed pedestrian bridge over Nutwood Avenue.

Figure 2-29 Site Access and Vehicle Circulation

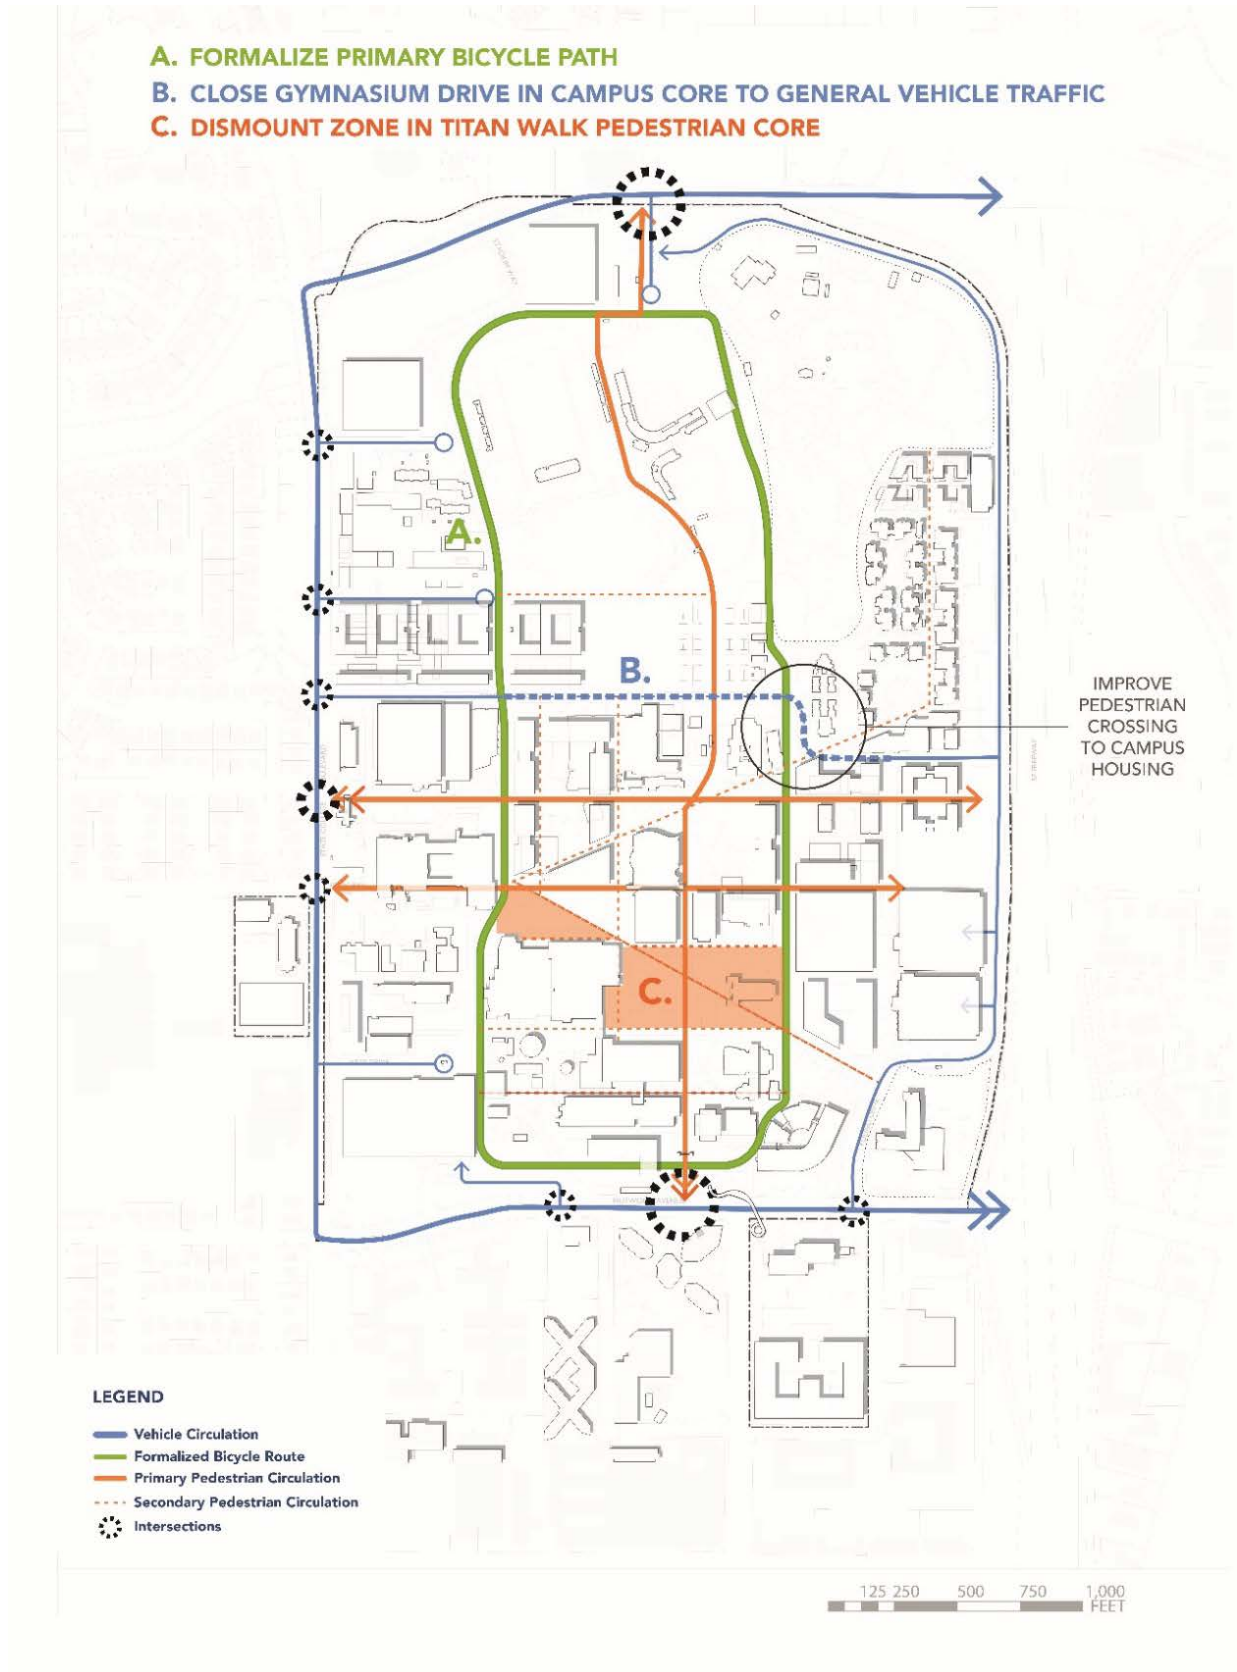

Figure 2-30 Proposed Pedestrian Bridge

To help support the TDM program, three mobility hubs are proposed with the Campus Master Plan. These hubs include one on the northern edge of campus along Yorba Linda Boulevard, the southern edge of campus along Nutwood Avenue and the western edge of campus along North State College Boulevard. The mobility hubs would include access and infrastructure to support transit, bikeshare, scootershare, carshare, on-demand rideshare, microtransit, electric vehicles (EVs) and rideables. Outside of the TDM program, CSUF aims to add different amenities and services onto campus such as dining, jobs, and additional housing. Providing these services on campus would help alleviate the need for students to commute off campus and have single-occupancy vehicles.

### 2.5.10 Proposed Facilities Development

The Campus Master Plan is a strategy for modifying the CSUF campus to accommodate growth and change over the next 20 years. It presents an overall picture of the future developed campus and includes recommendations for new construction, building renovations, change of use, and site development projects. These activities would be carried out throughout the life of the Campus Master Plan. Drawings of proposed facilities in the Campus Master Plan are conceptual sketches that highlight the location and purpose of improvements. The final design of each site and facility project will take place as projects are funded and detailed programming and design occurs.

Table 2-2 shows the breakdown of existing and proposed building square footage on the campus and Table 2-3 lists proposed new buildings and facilities. Figure 2-31 depicts the proposed projects on a campus map. The timing for implementation of individual projects during the course of Master Plan buildout implementation would depend on a number of considerations, including but not limited to priority of need, availability of surge space to accommodate the temporary relocation of programs, infrastructure needs, the need to minimize disruption of campus operations, and the availability of funding.

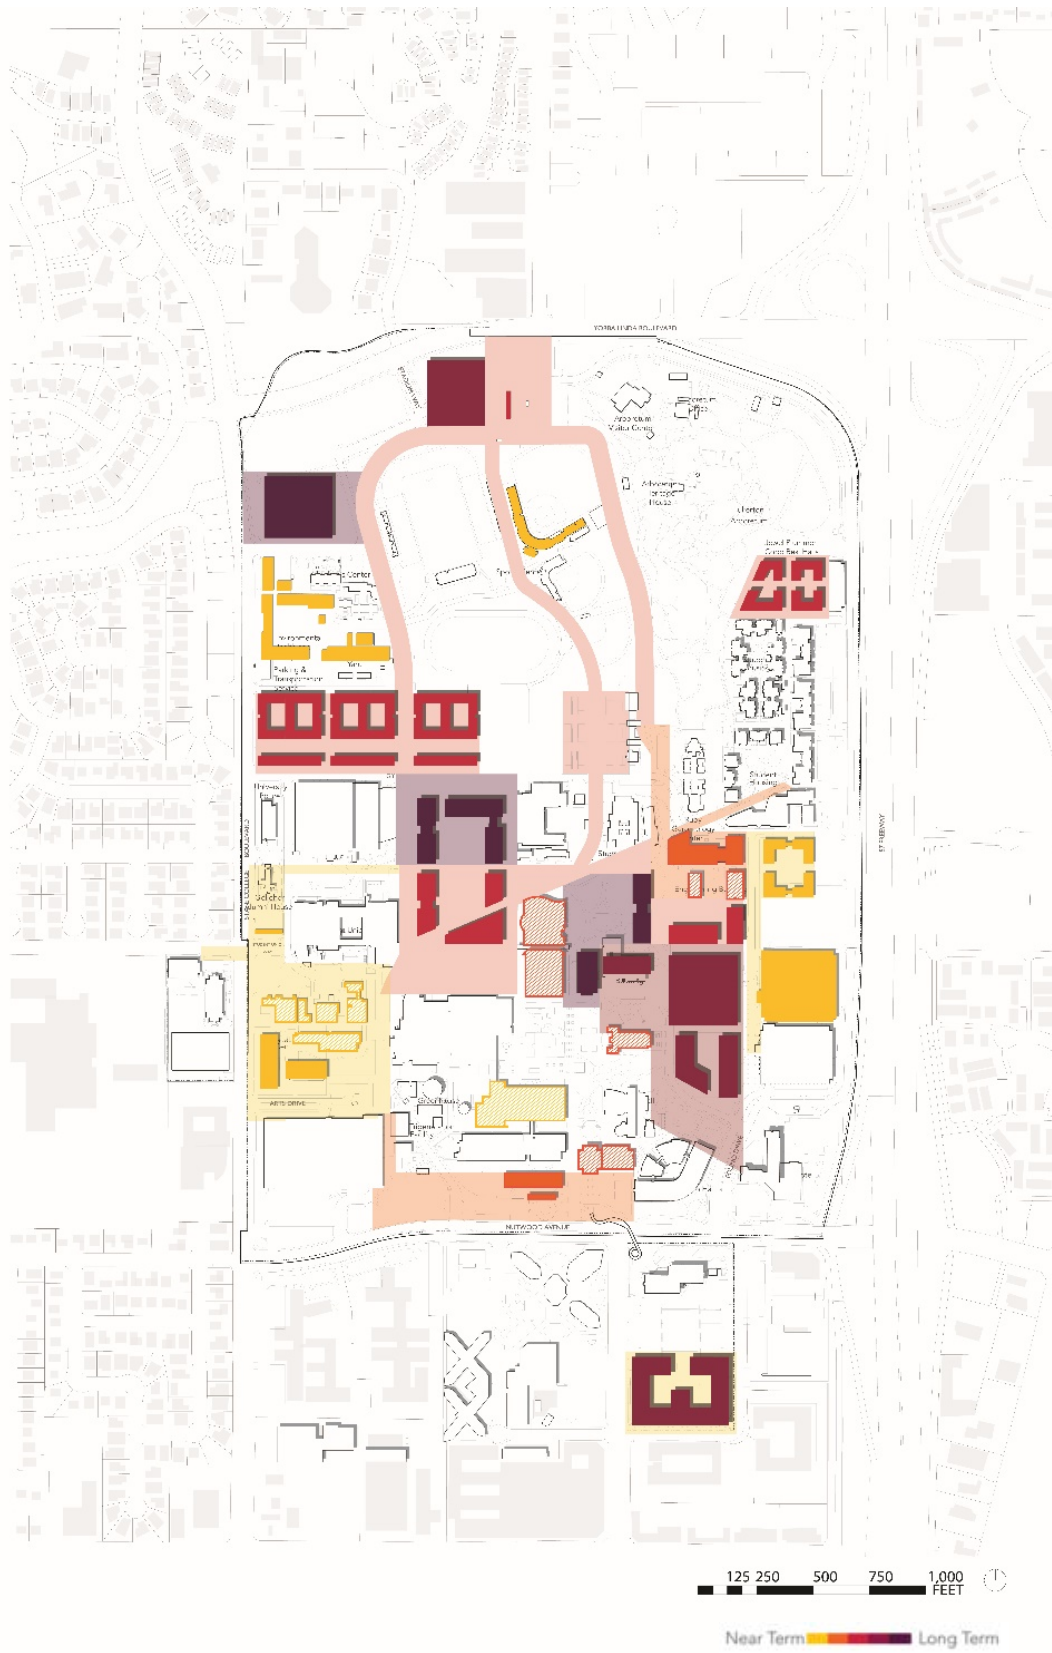

Table 2-2 Existing and Proposed Square Footage

Facilities	Existing (gsf)	New (gsf)	Total (gsf)
Academic Space	2,545,851	881,526	<b>3,425,577</b>
Non-Academic Space	305,589	40,000	<b>344,077</b>
Student Housing	464,111	803,880	<b>1,265,574</b>
Campus Amenities	355,807	800,000	<b>1,155,807</b>
Faculty Housing	117,538	539,000	<b>644,420</b>
Innovation Center	0	72,762	<b>72,762</b>
Arboretum	20,244	100,000	<b>120,244</b>
Event Center	0	254,100	<b>254,100</b>

## 2.6 Intended Uses of the EIR and Required Approvals

This EIR provides program-level analysis of the Master Plan and will be used by the CSU Board of Trustees to evaluate the potential environmental impacts associated with adoption of the proposed Campus Master Plan. As individual Campus Master Plan projects are proposed for implementation (i.e., when CSUF is ready to move forward with individual project planning and construction), additional CEQA compliance review, including site- and condition-specific analysis and specific permits and/or approvals may be necessary, depending on the circumstances of the particular project. Accordingly, each project will be evaluated at the time it is proposed for implementation to determine the need for additional environmental review. This EIR could also be relied upon by responsible agencies, if any, with permitting or approval authority over any project-specific action to be implemented in connection with a project.

The CSU Board of Trustees is the lead agency for this EIR and has sole authority to consider and approve the Campus Master Plan, certify the EIR, and adopt the Mitigation Monitoring and Reporting, Program, Findings of Fact, and Statement of Overriding Considerations. Table 2-4 lists agencies who may be required to issue permits or approve certain aspects of a particular Campus Master Plan project.

This EIR, and any environmental analysis relying on this EIR, is expected to be used to satisfy CEQA requirements of the listed responsible and/or trustee agencies and is anticipated to provide useful information those agencies that may issue a permit in support of the Campus Master Plan.

**Table 2-4 Anticipated Permits and Approvals for Campus Master Plan Implementation**

Agency	Permit/Approval
<b>Lead Agency</b>	
California State University, Board of Trustees	<ul style="list-style-type: none"> <li>▪ Approval and adoption of the Campus Master Plan</li> <li>▪ Approval of conceptual plans, development agreements and schematic plans for public-private partnerships</li> <li>▪ Approval of schematic plans for future facilities and improvements</li> <li>▪ EIR Certification</li> </ul>
<b>Other Agencies</b>	
Regional Water Quality Control Board	<ul style="list-style-type: none"> <li>▪ Section 401 Certification</li> <li>▪ Stormwater discharge permits</li> </ul>
State Fire Marshal	<ul style="list-style-type: none"> <li>▪ Future facility fire safety review and approval</li> </ul>
City of Fullerton Fire Department	<ul style="list-style-type: none"> <li>▪ Potential access to facilities</li> </ul>
Orange County Air Pollution Control District	<ul style="list-style-type: none"> <li>▪ Air quality construction and operational permits</li> </ul>
Orange County Transit Authority (OCTA)	<ul style="list-style-type: none"> <li>▪ Approval of any future regional bus service improvements</li> </ul>
City of Fullerton	<ul style="list-style-type: none"> <li>▪ Encroachment permits for work within city streets and rights-of-way</li> </ul>
Division of the State Architect	<ul style="list-style-type: none"> <li>▪ Accessibility Compliance</li> </ul>

## 3 Environmental Setting

---

This section provides a general overview of the environmental setting for the proposed project. More detailed descriptions of the environmental setting for each environmental issue area can be found throughout Section 4.0, *Environmental Impact Analysis*.

### 3.1 Regional Setting

California State University, Fullerton (CSUF) is located in the City of Fullerton, in the northern portion of Orange County, about 1,000 feet west of the Placentia city limit, two miles northeast of downtown Fullerton, and 3.25 miles northeast of downtown Anaheim. The City is bordered by the cities of La Mirada, La Habra, and Brea to the north, unincorporated County of Orange and City of Anaheim to the south, Cities of Yorba Linda and Placentia to the east, and unincorporated County of Orange and cities of La Mirada and Buena Park to the west. Figure 2-1 in Section 2.0, *Project Description*, shows the location of the project site in the region and the relationship to the surrounding neighborhood.

Regional access to the City is provided via the State Route (SR) 57, which is located near the City's eastern boundary, and the SR 91, which forms the City's southern boundary. Interstate 5 is situated at the southwest corner of the City. Local access is provided by various arterial highways that intersect the City, including Harbor Boulevard and Malvern Avenue/Chapman Avenue, among others.

The Mediterranean climate of the region and the coastal influence produce moderate temperatures year-round, with rainfall concentrated in the winter months. Although air quality in the area has steadily improved in recent years, the Orange County region remains a nonattainment area for ozone (urban smog).

### 3.2 Project Site Setting

CSUF is located on the eastern edge of the City of Fullerton and is bounded by educational institutions, residential, and mixed commercial uses. CSUF is approximately 240 acres, and includes a mix of residential, academic, and recreational buildings. Parking lots and structures are spread out along the campus' perimeter along with pedestrian and bicycle facilities interspersed throughout the center of campus.

The campus is located at 800 North State College Boulevard in the City of Fullerton, Orange County, and is primarily bounded by Nutwood Avenue to the south, North State College Boulevard to the west, Yorba Linda Boulevard to the north, and SR 57, to the east. Academic buildings, housing, and the university's pedestrian/bicycle system are interspersed throughout the campus. The campus' location approximately two miles from downtown Fullerton, makes it a semi-urban campus. The City's parks and trail systems serve CSUF for nature and recreational purposes. CSUF's campus is located approximately 16 miles northeast from the coastline of the Pacific Ocean.

The campus is characterized by a central core of academic and student support buildings in the southern half of the campus, with athletic facilities, on-campus residential, and surface parking lots spread across the northern portion of the campus. The northern and southern portions of the campus are separated by Gymnasium Campus Drive, which running east to west, bisects the

campus. The campus is predominantly developed with the exception of athletic fields and the campus' 26-acre Arboretum located in the northeastern corner of campus. CSUF is located near several transit stops and provides different transportation services for students and faculty/staff to commute to and from the surrounding region. Figure 2-2 shows CSUF in relation to its immediate surroundings.

Primary access to CSUF is provided by Yorba Linda Boulevard, North State College Boulevard, and Nutwood Avenue. These streets are maintained by the City of Fullerton and provide the main access to the campus via several access streets and driveways. Gymnasium Campus Drive bisects the center of campus while Folino Drive runs along the eastern edge of the campus and is located within the campus limits. This street connects with North Campus Drive and Yorba Linda Boulevard at the northern edge of the campus, and Nutwood Avenue at the southern edge of the campus.

## 4 Environmental Impact Analysis

---

This section discusses the possible environmental effects of the CSUF Campus Master Plan for the specific issue areas that were identified through the scoping process as having the potential to experience significant effects. A “significant effect” as defined by the *CEQA Guidelines* §15382:

means a substantial, or potentially substantial, adverse change in any of the physical conditions within the area affected by the project including land, air, water, minerals, flora, fauna, ambient noise, and objects of historic or aesthetic significance. An economic or social change by itself shall not be considered a significant effect on the environment. A social or economic change related to a physical change may be considered in determining whether the physical change is significant.

The assessment of each issue area begins with a discussion of the environmental setting related to the issue, which is followed by the impact analysis. In the impact analysis, the first subsection identifies the methodologies used and the “significance thresholds,” which are those criteria adopted by the City and other agencies, universally recognized, or developed specifically for this analysis to determine whether potential effects are significant. The next subsection describes each impact of the proposed project, mitigation measures for significant impacts, and the level of significance after mitigation. Each effect under consideration for an issue area is separately listed in bold text with the discussion of the effect and its significance. Each bolded impact statement also contains a statement of the significance determination for the environmental impact as follows:

- **Significant and Unavoidable.** An impact that cannot be reduced to below the threshold level given reasonably available and feasible mitigation measures. Such an impact requires a Statement of Overriding Considerations to be issued if the project is approved per §15093 of the CEQA Guidelines.
- **Less than Significant with Mitigation Incorporated.** An impact that can be reduced to below the threshold level given reasonably available and feasible mitigation measures. Such an impact requires findings under §15091 of the CEQA Guidelines.
- **Less than Significant.** An impact that may be adverse but does not exceed the threshold levels and does not require mitigation measures. However, mitigation measures that could further lessen the environmental effect may be suggested if readily available and easily achievable.
- **No Impact.** The proposed project would have no effect on environmental conditions or would reduce existing environmental problems or hazards.

Following each environmental impact discussion is a list of mitigation measures (if required) and the residual effects or level of significance remaining after implementation of the measure(s). In cases where the mitigation measure for an impact could have a significant environmental impact in another issue area, this impact is discussed and evaluated as a secondary impact. The impact analysis concludes with a discussion of cumulative effects, which evaluates the impacts associated with the proposed project in conjunction with other planned and pending developments in the area listed in Section 3.0, *Environmental Setting*.

The Executive Summary of this EIR summarizes all impacts and mitigation measures that apply to the proposed project.

*This page intentionally left blank.*

## 4.1 Aesthetics

---

This section evaluates the Campus Master Plan's potential impacts related to aesthetics, including potential impacts on scenic vistas, visual character and quality, and impacts from light and glare.

### 4.1.1 Environmental Setting

#### a. Regional Setting

The CSUF campus is located on the eastern side of the City of Fullerton in northeastern Orange County, California. The City of Fullerton is characterized by a pattern of auto-oriented, low- to medium-density land uses in an established urban environment, with areas of higher density and greater diversity of uses in the downtown area and along Chapman Avenue and Commonwealth Avenue, approximately two miles from campus. North of downtown is the North Harbor Corridor area, which flanks both sides of Harbor Boulevard and contains St. Jude's Hospital, other medical facilities, and the North Justice Center County courthouse. West Coyote Hills in northwest Fullerton, which lies north of Rosecrans Avenue and extends to the northern City limits, includes the Bob Ward Nature Preserve, the last large continuous piece of undeveloped land in the City. Industrial areas are located in the northern area of the City between Harbor Drive and Imperial Highway, and in the southeastern area of the City east of East Walnut Avenue and the railroad right-of-way utilized by Metrolink's Orange County Line and Amtrak's Pacific Surfliner.

The CSUF campus is located in a densely developed urban area of the City. The campus is located in the Education Focus Area of the City's General Plan (The Fullerton Plan), characterized by five education institutions and surrounding commercial and residential areas. The City envisions this area as a potential "student village" with future higher-density housing and commercial services to serve the student population (City of Fullerton 2012).

#### b. Campus Setting

CSUF is a relatively compact campus of approximately 240 acres bordered by local streets and surrounded primarily by residential, commercial, and educational uses. The main campus is bounded on the east by State Route (SR) 57, the south by Nutwood Avenue, the west by North State College Boulevard and the north by Yorba Linda Boulevard. Two small off-site areas are also part of the campus, including a block which lies on the southern side of Nutwood Avenue, bounded by Langsdorf Drive to the east, College Place to the south, and North Commonwealth Avenue to the west. The nine-story College Park building on this site, built in 1970, is the tallest CSUF building and houses the College of Communications and College of Education and additional classrooms and office space for staff and faculty (see Figure 4.1-2, View 9). That site also contains a parking lot and a 1,468 square foot HVAC unit on its eastern side. An additional portion of the campus is located on the west side of North State College Boulevard, south of Dorothy Lane, and north and east of La Vista High School. The campus is well-integrated into the surrounding urban environment, with several access points and parking facilities to serve a predominantly commuter student population.

The surrounding community is primarily characterized as urban with a mix of single-family and multi-family residences, commercial retail, and educational facilities, developed along major arterials and freeways in a manner typical of urban communities in southern California. The northern portion of campus abuts Yorba Linda Boulevard, a relatively flat seven lane roadway that intersects with North State College Boulevard to the west of campus and leads to SR 57 to the east

of campus. Across Yorba Linda Boulevard, the land is primarily flat with a mix of one-story civic and community uses, gas station, and a three-story multi-family housing complex. One of CSUF's three discontinuous parts of campus, a large parking lot, is located directly across Yorba Linda Boulevard. In between developments are large trees that span the length of Yorba Linda Boulevard, hiding public views along Yorba Linda Boulevard from several developments across CSUF. Notable buildings in this area are shown in Figure 4.1-1, and include The Dong Shin Church of Southern California, Fullerton Fire Department Station 5, and MB Ketchum University.

The western portion of CSUF abuts North State College Boulevard, a flat seven lane arterial in the City that provides access points into the west side of campus. Across from North State College Boulevard is land that is primarily flat with single-family housing, public facilities ranging in different heights, and surface parking lots. One of CSUF's three discontinuous parts of campus, Titan Hall, is located directly across North State College Boulevard. A large retaining wall spans the majority of North State College Boulevard which partially obscures public views of the single-family housing developments. Some public facilities have an older architectural style and are one to two stories in height. Newer public facilities affiliated with CSUF have a more modern architectural style and are taller in height, some being four stories, with larger mass. Certain areas along North State College Boulevard consist of lawns and tall trees, keeping a consistent aesthetic with Yorba Linda Boulevard. Notable buildings in this area include The Troy High School (on Dorothy Lane), and La Vista/Sierra High Schools.

The southern edge of campus abuts Nutwood Ave, a six-lane roadway that spans the entire length of the southern portion of CSUF. Across from Nutwood Avenue is relatively flat land that is characterized as a moderately dense urban area with residential, commercial, office, and institutional development. Existing development consists of educational facilities, student and multi-family residential complexes, neighborhood commercial centers, and office buildings that are separated by landscaping and surface parking lots. One of CSUF's three discontinuous parts of campus, College Park, is located directly across Nutwood Avenue. Development is primarily setback with landscaping and trees set before it. Residential complexes are architecturally more modern and are three stories in height. Other development is primarily one or two stories in height with moderate massing with the exception of the 9-story College Park Building affiliated with CSUF. Hope International University and a restaurant complex with two one-story buildings, parking lots, and sitting areas are located in this area.

East of Campus lies SR 57. SR 57 is an at-grade multi-lane freeway with a concrete divider and sparse vegetation and trees lining the western edge adjacent to the campus. Across SR 57 is a sound barrier wall and residential neighborhoods and commercial structures.

## Campus Visual Character

The visual character of the campus is characterized by both urban and suburban development. The campus is characterized by a central core of academic buildings in the southern half of the campus, with athletic facilities at the central core of the northern portion of the campus. The northern and southern portions of the campus are separated by Gymnasium Campus Drive, which running east to west, bisects the campus. Photographs of the campus are contained in Section 2.0, *Project Description*.

### *Northern Campus*

The visual character of the northern portion of the campus is largely defined by the Arboretum, athletic facilities, student housing, surface parking lots, and smaller, temporary and permanent

structures. The Titan Sports Complex, featuring the multipurpose 10,000-seat Titan Stadium, baseball pavilion, track and tennis courts, was completed in 1992. Due to the range of uses in this portion of campus, the visual framework is defined by a variety of architectural forms, styles, and physical spaces. With the exception of the Arboretum, this portion of campus is not densely landscaped, with mature street trees lining North State College Boulevard, Yorba Linda Boulevard, and SR 57, and placed somewhat sparingly within surface parking lots.

The northern portion of the campus is not densely developed and is therefore easily visible from the surrounding community. The campus can be seen from both the surrounding residential neighborhoods to the west and north, and from SR 57 located to the east. With the exception of student housing structures along the eastern edge of this portion of campus, the buildings in the northern part of campus are one to two stories in height, allowing for views from the campus, towards points located to the north, east, and west.

The 26-acre Arboretum serves as a regional resource for research, recreation, education, and agricultural heritage. The Arboretum is accessed from West Campus Drive and North Campus Drive off Yorba Linda Boulevard, and is bounded by Folino Drive to the north, SR 57 to the east, a campus bicycle path and athletic fields to the west, and student residential housing to the south. It includes a collection of rare plants from around the world and features scenic landscapes, two ponds, streams, and walking trails. The facility began in a field of the region's iconic orange groves, and officially opened to the public in 1979. It is characterized by vegetation and winding paths that bisect the various gardens. In 2006, the university opened the Fullerton Arboretum Visitor Center and the Orange County Agricultural and Nikkei Heritage Museum, the campus's first "green" building. The Arboretum also is home to Heritage House, an eligible historic resource. This restored 19th-century dwelling is one of the last remaining examples of the Eastlake Victorian style in Fullerton and was moved to its current site in 1972. It serves as a cultural museum for North Orange County (CSUF 2019b).

### *Southern Campus*

The visual character of the southern portion of the campus is defined by academic buildings, student support facilities, campus recreation facilities, and both parking structures and surface parking lots. This portion of the campus is more densely developed with large, multistory structures. As the hub of academic life at CSUF, this portion of campus contains a wide mix of uses and buildings with some clearly defined architectural styles. While the edges of the southern portion of campus are visible from North State College Boulevard, Nutwood Avenue, and SR 57, larger buildings obscure views of the campus, as well as views from the campus.

Within the southern portion of campus, each main cluster of academic buildings is accompanied by a landscaped quad or other type of landscaped courtyard area. Additionally, each academic building consists of a "front porch"; an area that is immediately near the entrance of each building that is landscaped to help connect each building to exterior quads and other landscaped areas. As stated previously, the campus has transitioned to more drought-tolerant landscaping due to the regional climate. As such, trees are strategically placed on campus in certain main quad areas to provide shading. Smaller landscaped areas outside certain buildings include smaller foliage and other drought-tolerant foliage but do not consist of larger trees. Areas that consist of higher levels of shading include The Commons adjacent to the Titan Walk, The Engineering and Computer Science Quad, the Quad in front of the Pollak Library, and the quad areas outside Gordon Hall.

Additionally, the campus quad marks the heart of the southern half of campus, or the campus core. Buildings located within the campus core include McCarthy Hall, Claves Performing Arts Center,

Pollak Library, Humanities and Social Sciences Building, and Langsdorf Hall. As discussed in Section 4.3, *Cultural Resources*, these buildings have a distinctive New Formalist/Late Modern architectural style and exhibit a unified site design with an emphasis on monumentality. Smooth white and natural-toned concrete exteriors and repeating hexagonal motifs are seen throughout the district.

The southern portion of campus hosts CSUF's sculpture art collection. The collection is mainly centered around the Visual Arts Center near North State College Boulevard. Other sculpture locations include courtyards and open space areas near the Titan Gym, Titan Bookstore, Titan Student Union, Pollak Library, and Langsdorf Hall.

### *Architectural Styles*

CSUF's primary architecture is a mix of historical and modern. Uniformity in scale is maintained between the older and contemporary buildings, and many of the taller buildings are five or six stories in height. Langsdorf Hall, Fullerton Towers I, and College Park are the tallest buildings on campus at nine stories in height.

Approximately 40 percent of the campus' current building stock was constructed during the heyday of New Formalism, Brutalism, and Late Modernism between 1960 and 1974. The 1960 Master Plan (Figure 4.3-1) in Section 4.3, *Cultural Resources*, called for the construction of six buildings: Letters and Sciences (1963), Music-Speech-Drama (1965), Physical Education and Gymnasium (1965), Library (1966), Cafeteria-Commons (1967), and Humanities and Social Sciences (1969). Created as part of the first major building campaign at CSUF, the buildings display a unified site plan, with each component arranged around a central quad and commons. Unified by axial circulation corridors and landscaping, the early campus core was completed between 1963 and 1969.

Notable campus architects are discussed in Section 4.3, *Cultural Resources*. Popular during the 1960s and 1970s, Brutalist design is characterized by buildings that are usually formed with striking blockish, geometric, and repetitive shapes – namely, hexagonal forms (see example in Figure 4.1-2, View 5). The structure is typically heavy and unrefined with coarsely molded surfaces, usually exposed concrete. Langsdorf Hall and the Pollak Library were designed in Brutalist form, as were other buildings in the City of Fullerton, such as the North Orange County Municipal Court complex (Fullerton Heritage 2019). As discussed in Section 4.3, *Cultural Resources*, four historic-period buildings are located on the CSUF campus: the George G. Golleher Alumni House (Mahr House), the Titan House (Henry T. Hetebrink House), the Heritage House (Dr. George C. Clark Home and Office), and the Pollak Library.

As visible in a 1972 aerial, the unified, axial site plan of the campus was already intact by the early 1970s, with administrative and academic buildings located in the south of the campus and athletic fields in the northern extent of the campus (Figure 4.3-3 in Section 4.3, *Cultural Resources*). The northeastern area of campus, dedicated to the Fullerton Arboretum since 1979, is characterized by vegetation and winding paths that bisect the various gardens. By the 1980s and 1990s, as the campus expanded, new buildings, including student housing, were constructed primarily on the periphery of the central quad.

Buildings added to the campus after 2000 were primarily built in a contemporary architectural style characterized by large windows, transparency, and dynamic styles, such as the redesigned addition of the Titan Student Union. New buildings typically use concrete, steel, and glass for design elements, such as the Titan Student Union and Becker Amphitheatre.

### *Open Space and Landscaping*

The campus typically uses grass or xeriscape landscaping, pine or palm trees, or drought-resistant groundcover between buildings, along bicycle and pedestrian pathways, and in parking areas. In recent years, CSUF has been replacing large lawn areas with drought-tolerant landscaping, including Chitalpa pink dawn, Desert Museum Palo Verde, Mexican bird of paradise, feather grass, salvia leucantha, lantana, agave, dwarf bougainvillea and geraniums (CSUF 2014). Large grass areas remain in several locations for recreational purposes, such as the outdoor gathering space outside Becker Amphitheatre.

Areas between buildings are mainly hardscaped pathways and ornamental landscaping. The largest hardscaped courtyards are the Central Quad, Humanities Quad, the Steven G. Mihaylo Hall Courtyard, Titan Gym Porch, and outside the Kinesiology Building. The Titan Walk is the main pedestrian thoroughfare in the academic core, connecting the Pollak Library, and is lined with palm trees and outdoor furniture such as benches. The Titan Walk provides access to several other bike paths that are intertwined throughout campus. The Central Quad is a mix of pervious ground cover and hardscape with large shade trees. The Campus Bike Path is a connection of hardscape pathways around the campus. Additionally, parking lots typically have shade trees lining the edges in row planters.

The largest open space on campus is the Arboretum that is nestled in the northeastern corner of campus. As further discussed in Section 2.0, *Project Description*, the Arboretum is a 26-acre botanical garden that consists of several bodies of water along with plants from all over the world. The Arboretum is divided into five main areas: the educational/visitor area, Mediterranean Collection, Desert Collection, Woodlands Collection, and Cultivated Collection. Each of these collections consists of substantially different landscaping that fits in with the region the collection is showcasing. Some collections such as the Woodlands Collection are more arboreal, with a higher amount of tree cover and shading. Other collections such as the Cultivated Collection, Desert Collection, and Mediterranean Collection are less arboreal containing a variety of shrubs, bushes, and plants. The Cultivated Collection is designed and oriented to help emphasize the Heritage House that lays at the western edge of the collection. Section 4.4.2, *Cultural Resources within the Project Site*, includes more detailed information on the Heritage House. Collections are separated from each other by pedestrian dirt paths that weave and connect throughout the entire Arboretum.

## **Views of Campus from Public Viewpoints**

### *Viewer Sensitivity*

According to the Federal Highway Authority (FHWA), viewer sensitivity is considered in assessing the impacts of visual change and is a function of several factors. The sensitivity of the viewer, or viewer concern, is based on the visibility of resources in the landscape, proximity of the viewers to the visual resource, elevation of the viewers relative to the visual resource, frequency and duration of views, numbers of viewers, and types and expectations of individuals and viewer groups (FHWA 1981).

Views of high quality have topographic relief, a variety of vegetation, rich colors, impressive scenery, and unique natural and/or built features. Views of medium quality have interesting but minor landforms, some variety in vegetation and color, and/or moderate scenery. Views of low quality have uninteresting features, little variety in vegetation and color, uninteresting scenery, and/or common elements.

### *Off-Campus Viewpoints*

Off-campus viewpoints are those that are off-site public vantage points looking towards the direction of campus. The locations are shown in Figure 4.1-1 and displayed as photographs in Figure 4.1-2.

Views of the campus from off-campus viewpoints are primarily available towards tall buildings such as the Mihaylo building, College Park building, and the Fullerton Marriott (as shown in Figure 4.1-2, Viewpoints 10 and 11), and parking lots, parking garages, single-story campus facilities, on-campus residential facilities, and tree and hedge-lined landscaping. The campus and its immediate surroundings are located on land that is generally flat, a condition which limits views of the campus from off-site viewpoints. North State College Boulevard, Yorba Linda Boulevard, and Nutwood Avenue provide the most direct views of the campus.

East-facing views of the campus from North State College Boulevard are of medium to high visual quality due to the dense landscaping and built features visible from campus (see Figure 4.1-2, Viewpoints 1 and 2). Limited eastward views of the campus can be seen from the nearby residential developments and La Vista/Sierra High Schools on North State College Boulevard. Views generally consist of parking lots, parking structures, gates, ornamental landscaping, and one-story buildings such as the George G. Golleher Alumni House, University Police Station, and the Environmental Health and Instructional Safety trailer. The State College Parking Structure can be viewed in the background of some of these buildings, as it is taller than the single-story structures.

Views of the northern areas of campus, looking south from Yorba Linda Boulevard, are restricted to parking lots and the outer edge of the Fullerton Arboretum and Goodwin Stadium (see Figure 4.1-2, Viewpoints 3 and 4). These views are generally low to medium quality due to a lack of central focus points and definition of edges between visual structures.

North-facing views of the campus from Nutwood Avenue and Folino Drive are generally high visual quality, as they include more developed campus edges, entranceway signs, and views of landmark buildings (see Figure 4.1-2, Viewpoints 8, 10, and 11, and Figure 4.1-2, Viewpoints 5 and 6). Streets south of Nutwood Avenue, such as Titan Avenue, Commonwealth Avenue, and Langsdorf Drive, provide direct views of the campus when traveling directly north towards the campus. However, views may be limited to landscaping and parking facilities depending on the vantage point. Eastward views of the campus from Nutwood Avenue (see Figure 4.1-2, Viewpoint 7) include campus buildings and facilities on both sides of the street, including the College Park building south of Nutwood Avenue.

Westward views looking toward campus from SR 57 are generally low to medium visual quality due to the chain fence and sporadic vegetation. Sporadic views of residential housing complexes on campus can be seen (see Figure 4.1-2, Viewpoint 8). Westward views looking toward campus from the multi-family residential areas east across SR 57 are also generally low quality, as views are blocked by the sound barrier wall or landscaping.

Figure 4.1-1 Surrounding Land Uses, Photograph Locations, and Viewpoint Locations

Imagery provided by Microsoft Bing and its licensors © 2020.

Fig 4.1-1 Surrounding Land Uses and Photograph Locations

Figure 4.1-2 Public Views: Representative Viewpoints

**Viewpoint 1.** Eastward view to CSUF campus, Corporation Drive Driveway, from North State College Boulevard. Presents a typical view of campus from North State College Boulevard just west of campus, from an access road for a residential housing development. Views mainly consist of fencing, single-story campus buildings, ornamental trees and landscaping, utility infrastructure, lighting, and sidewalk.

**Viewpoint 2.** Eastward view to CSUF campus from North State College Boulevard and Melody Lane. Presents a typical view of campus from North State College Boulevard just west of campus, from an access road for a residential housing development. Views mainly consist of fencing, a parking garage, the single-story University Police Station (left), the George G. Golleher Alumni House (right), ornamental trees and landscaping, utility infrastructure, lighting, and sidewalk.

**Viewpoint 3.** Southward view to CSUF campus from Yorba Linda Boulevard and Stadium Way. Presents a typical view of campus from Yorba Linda Boulevard just north of campus. Views mainly consist of parking areas, streetlights, ornamental trees and landscaping, entranceway signage, lighting, and sidewalk. More distant views include stadium signage.

**Viewpoint 4.** Southward view to CSUF campus from Yorba Linda Boulevard and N. Campus Drive. Presents a typical view of campus from Yorba Linda Boulevard just north of campus. Views mainly consist of parking areas, entranceway signs, streetlights, ornamental trees and landscaping, utility infrastructure, lighting, and sidewalk. More distant views include stadium signage.

**Viewpoint 5.** Northward view to CSUF campus from Nutwood Avenue near N. Commonwealth Avenue. Presents a typical view of campus from Nutwood Avenue. Views mainly consist of hardscape and landscape, decorative elements such as fountains, trees, and tall buildings.

**Viewpoint 6.** Eastward view on Nutwood Avenue at N. Commonwealth Avenue. Views mainly consist of high-quality views of Minaylo College of Business and Economics to the north (left) and the College Park building to the south (right). Immediate views include street infrastructure, trees, sidewalks, and lighting. SR 57 overpass is seen in the distance.

**Viewpoint 7.** Northward view to CSUF campus from Nutwood Avenue near the Nutwood Parking Structure. Presents a typical view of campus from Nutwood Avenue. Views mainly consist of the parking structure, street lighting, trees, sidewalks, and landscaping.

**Viewpoint 8.** Southwest-facing view to CSUF campus from SR 57. Views mainly consist of the Elm, Fig, and Holly student residence halls, parking, fencing, trees, and vegetation.

## Scenic Views and Vistas

A viewshed is generally defined as an area that can be seen from a given vantage point and viewing direction. A viewshed is composed of foreground items (items closer to the viewer) that are seen in detail and background items (items at some distance from the viewer) that frame the view. A scenic vista is generally defined as a view of undisturbed natural lands exhibiting a unique or unusual feature that comprises an important or dominant portion of the viewshed. Scenic vistas may also be represented by a particular distant view that provides visual relief from less attractive views of nearby features. Other designated Federal and State lands, as well as local open space or recreational areas, may also offer scenic vistas if they represent a valued aesthetic view within the surrounding landscape.

Scenic views of the hills and open space preserves are the predominant scenic vistas in the area. The closest open space area to the campus is the Coyote Hills East Preserve area (including the Panorama Nature Preserve, Vista Park, and Mountain View Park), located approximately 0.50-mile northwest of the campus. Due to the generally low elevation change and the urban development between the campus and the Coyote Hills East Preserve area, no views of the Coyote Hills East Preserve are currently accessible from CSUF on the street level. Views of the Coyote Hills East Preserve or other distant foothills may be seen from tall buildings on the campus, such as Langsdorf Hall, but these views are not considered publicly accessible. Distant northern views of the Los Angeles National Forest, South San Jose Hills, and Santa Ana Mountains are present at limited locations on the campus, mainly around athletic fields and other open spaces (see Figure 4.1-2, View 1). Due to the generally low elevation change, urban development, and trees on and off campus, scenic views of distant mountains or hills are extremely limited. Some views of the campus are accessible from the Panorama Nature Preserve and other areas of high elevation but are generally limited to the taller buildings on campus.

The City of Fullerton identifies scenic corridors in its General Plan. A segment of North State College Boulevard has been identified as a scenic corridor, with its southern end at the intersection of North State College Boulevard and Yorba Linda Boulevard at the northwest corner of the campus and northern end at Rolling Hills Drive near the City of Fullerton boundary line. A limited view of segment of North State College Boulevard scenic corridor is accessible from the northwest corner of the campus, which is a parking lot. There are no State Scenic Highways in or near the City of Fullerton.

The Fullerton Arboretum, located in the northeastern portion of campus, contains landscaping features such as waterfalls, ponds, trails, and plant collections, provides a scenic landscape on campus (see Figure 4.1-2, View 2). The Arboretum provides a scenic area of visual relief for students and staff and is accessible to the general public. Views of the Arboretum may be accessed from inside the residential hall buildings located on the east side of campus, but views of the Arboretum are not accessible from public vantage points on or off campus.

## Lighting and Glare

Glare is a visual sensation caused by excessive and uncontrolled brightness. It can be disabling or simply uncomfortable. Light trespass is also referred to as nuisance glare that is visible from adjacent properties. Uncontrolled light sources such as floodlights and unshielded luminaires at low elevations can create glare and can also be the cause of light trespass. Lighting temperature also determines light impacts. Too high of a lighting temperature and the associated blue light can impact circadian rhythm, cause glare, and contribute more to light pollution (CSU 2018).

### *On-Campus Light and Glare*

The majority of existing sources of nighttime illumination on the campus include interior and exterior building illumination and lighting along internal campus roadways, in surface parking lots, and along pedestrian pathways. Other prominent sources of nighttime illumination include overhead lighting installed at the aquatics center, tennis courts, and fields and stadiums during nighttime games and practices. Since 2015, CSUF replaced 68,000 interior tube lights with more efficient LED lights, which has reduced nighttime light pollution (CSUF 2019b).

With respect to daytime sources of glare, existing campus building façade materials are predominantly concrete; some buildings employ metal panels, plaster, brick, and/or curtain wall systems. Some of the modern buildings on the campus, particularly those constructed after 2000, were designed with reflective materials such as metal and large windows facing campus walkways and central areas. With their large expanses of reflective materials, these buildings have the potential to generate glare at certain times of the day (see Titan Student Union as example, Figure 2-8).

### *Off-Campus Light and Glare*

According to The Fullerton Plan, and considered herein for informational purposes (see Regulatory Setting for further discussion), sensitive light and glare receptors in and around the City include residential uses, natural wildlife habitat areas, and open space lands adjacent to existing or planned development. There are no natural wildlife areas or open space lands adjacent to campus; however, residential development exists along North State College Boulevard, Yorba Linda Boulevard, and Nutwood Avenue.

Off-campus lighting sources include overhead street lighting on North State College Boulevard, Yorba Linda Boulevard, Nutwood Avenue, and SR 57. La Vista/La Sierra High School and Troy High School on North State College Boulevard, approximately 100 feet east of campus, feature a lighting system for their facilities, including parking lots and athletic fields. Outdoor lighting sources along Yorba Linda Boulevard include streetlights, outdoor lighting around buildings and in parking lots serving the Dong Shin Church approximately 330 feet north of campus, Marshall B. Ketchum University, businesses, and multi-family housing complexes, all approximately 100 feet north of campus. Exterior illuminated signage and outdoor lighting at the commercial businesses, Hope International University, and multi-family housing complexes located along Nutwood Avenue. The Marriott Hotel, located in the southeastern corner of the CSUF campus, has its own exterior lighting around the buildings, parking lots, and pool area, and light emanating from building interiors.

The use of reflective building materials is generally low in the areas surrounding the campus. Buildings in the area are typically constructed of brick, stucco, or wood, but some buildings feature large windows that face the street, such as Hope International University and some of the commercial buildings along Nutwood Avenue. As such, opportunities for noticeable glare during daytime hours are low. The City of Fullerton does not include any areas known for night sky observation.

## 4.1.2 Regulatory Setting

As a state entity, the California State University (CSU), of which CSUF is a part, is not subject to regional or local plans and policies of cities or counties that regulate development. Although CSUF is not subject to local plans of cities and counties, such plans and policies are of interest or concern because it is University policy to seek consistency with regional and local plans and policies, where

feasible. Information pertinent to visual resources from the City and County general plans also follows, for informational purposes.

## Federal

There are no applicable federal regulations regarding the protection of visual resources that would be applicable to the Campus Master Plan or the campus.

## State

### *California Code of Regulations, Title 24*

Title 24 of the California Code of Regulations (CCR), also known as the California Building Standards Code, consists of regulations to control building standards throughout the State. The California Electrical Code (Title 24, Part 3) and Green Building Standards Code (also referred to as the CaLGreen Code; Title 24, Part 11) stipulate minimum light intensities for safety and security at pedestrian pathways, circulation ways, and paths of egress.

The CaLGreen Code (24 CCR, Part 11, Paragraph 5.106.8, Light Pollution Reduction) provides that all nonresidential outdoor lighting must comply with the following:

- The minimum requirements in the California Energy Code (CEC) for Lighting Zones 1–4 as defined in Chapter 10 of the California Administrative Code; and
- Backlight, Uplight, and Glare (BUG) ratings as defined in the Illuminating Engineering Society’s Technical Memorandum on Luminaire Classification Systems for Outdoor Luminaires; and
- Allowable BUG ratings not exceeding those shown in Table A5.106.8 in Section 5.106.85 of the CaLGreen Code; or
- A local ordinance lawfully enacted pursuant to Section 101.7 of the CaLGreen Code, whichever is more stringent.

The 2019 updates to the CaLGreen Code, which went into effect on January 1, 2020, require nonresidential buildings to maximize light emitting diode (LED) technology in indoor and outdoor lighting.

### *California State Scenic Highway Program*

The California Scenic Highway Program was created in 1963 by California State legislature to “protect and enhance the natural scenic beauty of California highways and adjacent corridors through special conservation treatment,” and includes state routes identified as scenic by The California Department of Transportation (Caltrans). The “eligible” designation applies to a specific segment of the designated highway, and depends on several factors, including the breadth of the landscape that is visible by travelers, the scenic quality of the landscape, and the extent to which development intrudes upon a traveler’s enjoyment of the view. The California State Legislature makes state highways eligible for designation as a scenic highway, listing them in the Streets and Highways Code Sections 260-284. For a highway to be declared scenic by Caltrans, the local government with jurisdiction over abutting land must adopt a “scenic corridor protection program” that limits development, outdoor advertising, and earthmoving, and Caltrans must agree that it meets the criteria (California Office of Legislative Counsel 1969).

### *California State University Guidelines, Standards, and Policies*

The CSU has developed guidelines, standards, and policies for development and facilities on CSU campuses, including energy, utilities, indoor and outdoor lighting, access, and construction. CSUF is currently replacing lights with LED lighting per compliance with the CSU Outdoor Lighting Design Guidelines. A major source of light on university campuses is stadium floodlights during games and practices. By switching to LED lighting, stadium floodlights on athletic fields would control light distribution to the playing surface, avoiding light pollution and unwanted light spill. LED lighting is also better for viewing of big screens and scoreboards, and result in flicker free, super-slow-motion TV (CSU 2018).

The CSU Outdoor Lighting Design Guidelines contain the following policies to reduce impacts from light and glare:

- Walkways and parking lots are required to be 0.5fc minimum and 1.0fc average and be within Cal-Green Tier II compliance.
- Per California Energy Code requirements, all permanently installed outdoor lighting must be controlled by a photosensor or astronomical time switch to automatically turn off lighting when daylight is available.
- Lighting of building facades, parking lots, garages and canopy luminaires mounted below 24 feet must be controlled such that the power usage in watts can be reduced by 40-90 percent.
- Use fully shielded luminaires for area lighting.
- Do not over-light areas.
- Avoid any direct light into adjacent building windows. Luminaires attached to exterior building façades should be located between windows, not directly above windows.
- Consider dimming or turning off lighting when not needed and activate with motion sensors or timers when activity occurs to minimize light trespass into building interiors.
- All brightness levels in the nighttime environment should be in approximately the same range.
- Switch to LED lighting, as the light output is directed where it is needed, not into the night sky or neighboring properties. LED lighting also provides good visibility with lower light levels. LED parking structure fixtures are designed to control surface glare through optical shielding.
- Careful placement and dimming of light fixtures can prevent or reduce light trespass outside of the structure or property line.

### **Regional and Local**

As stated in the beginning of this Regulatory Setting section, CSUF may consider, for informational purposes, aspects of local plans and policies for the communities surrounding the campus when it is appropriate, but is not bound by local or regional planning regulations or documents such as the City's General Plan or municipal code.

#### *The Fullerton Plan*

The Fullerton Plan is the City's governance tool focused on achieving the "Fullerton Vision" (City of Fullerton 2012). The Fullerton Vision is a statement of aspirations associated with improved quality of life included in The Fullerton Plan. Part II of The Fullerton Plan consists of individual elements and goals and *Master Element A: The Fullerton Built Environment*, which contains goals and policies relevant to aesthetic resources. The Fullerton Plan includes Scenic Corridors but does not identify

scenic vistas or resources. The City of Fullerton does not have jurisdiction over CSUF; however, CSUF considers aspects of local plans and policies for the communities surrounding the campus when it is appropriate and feasible, although it is not bound by those plans and policies in its planning efforts. Relevant goals and policies of the *Master Element A: The Fullerton Built Environment* related to community character, design, and aesthetics include the following:

**Goal 1: Resilient and vital neighborhoods and districts.**

- **P1.1 Regional Coordination.** Support regional and subregional efforts to create a strong sense of place and support the efficient use of land.
- **P1.2 Subregional Coordination.** Support projects, programs and policies to promote compatibility and mutually beneficial built environments and land uses with adjacent jurisdictions and other agencies.
- **P1.3 Protection and Restoration of Natural Resources.** Support projects, programs, policies and regulations to protect, and where appropriate restore, the natural landscape, topography, drainage ways, habitat, and other natural resources when planning improvements to existing and new neighborhoods and districts.
- **P1.4 Connection and Integration of Uses.** Support projects, programs and policies to improve connections between housing, shops, workplaces, schools, parks and civic facilities, and integrate uses where possible and appropriate.
- **P1.5 Maintenance and Improvements of Existing Built Environment.** Support projects, programs, policies and regulations to maintain positive attributes of the built environment and seek continual improvement.
- **P1.8 Consideration of Neighborhood Impacts.** Support projects, programs, policies and regulations to evaluate and consider short- and long-term impacts of significant planning efforts or developments on nearby neighborhoods.
- **P1.10 Focus Area Planning.** Support projects, programs, policies and regulations to evaluate ways to contribute to the resiliency and vitality of neighborhoods and districts as part of community-based planning of Focus Areas.
- **P1.11 Compatibility of Design and Uses.** Support programs, policies and regulations to consider the immediate and surrounding contexts of projects to promote positive design relationships and use compatibility with adjacent built environments and land uses, including the public realm.

**Goal 2: A positive identity and distinctive image.**

- **P2.1 Perceived Image and Identity.** Support regional and subregional efforts to improve the public image and perception of Southern California, Orange County, and North Orange County.
- **P2.2 Distinctive and Memorable Places.** Support projects, programs, policies and regulations to promote distinctive, high-quality built environments whose form and character respect Fullerton's historic, environmental and architectural identity and create modern places that enrich community life and are adaptable over time.
- **P2.3 Distinctive Landmarks.** Support projects, programs, policies and regulations to preserve existing landmarks and encourage the creation of new landmarks that reinforce Fullerton's identity and image.
- **P2.4 Sense of Place.** Support projects, programs, policies and regulations to reinforce the character and sense of place of established neighborhoods and districts by preserving and

enhancing the attributes which contribute to neighborhood and district identity, vitality and livability.

- **P2.5 Maintenance and Management.** Support programs and policies to facilitate the efforts of property and business owners within neighborhoods and districts to maintain and manage the quality of their environments.
- **P2.6 Focus Area Planning.** Support projects, programs, policies and regulations to create a positive identity and distinctive image as part of community-based planning of Focus Areas.
- **P2.7 Relationship to Street.** Support projects, programs, policies and regulations to site and design buildings to create a positive, accessible image along the street and reinforce a vibrant and comfortable public realm.
- **P2.8 Responsiveness to Context.** Support projects, programs, policies and regulations to respect the local context, including consideration of cultural and historic resources, existing scale and character and development patterns of the surrounding neighborhood or district.

**Goal 4: Valued and preserved historic resources.**

- **P4.4 Historic Character and Sense of Place.** Support projects, programs, policies and regulations to reinforce the character and sense of place of established neighborhoods and districts by protecting and preserving those elements in both the private and public realms which contribute to the historic character through the use of tools including, but not limited to, preservation overlay zones and landmark districts.
- **P4.5 Historic Building Preservation.** Support projects, programs, policies and regulations to encourage the protection and preservation of individual historic structures throughout the City, but with particular attention to the preservation of noteworthy architecture in the downtown.
- **P4.6 Focus Area Planning.** Support projects, programs, policies and regulations that contribute to the preservation of historic resources as part of community-based planning of applicable Focus Areas.
- **P4.7 Responsiveness to Historic Context.** Support projects, programs, policies and regulations to design new buildings that respect the integrity of nearby historic buildings while clearly differentiating the new from the historic.
- **P4.9 Historic Building Retrofits.** Support projects, programs, policies and regulations to encourage the retrofit of historic buildings in ways that preserve their architectural design character, consistent with life safety considerations, maintaining the unique visual image of Fullerton.

The Mobility Chapter of The Fullerton Plan “seeks to link Fullerton’s system of roadways, bicycle and pedestrian facilities, bus and rail transit systems, and airport—all of which collectively provide for the movement of persons, goods, and services throughout the City, the region, and beyond” (Fullerton 2012). It identifies Scenic Corridors in the City for the purpose of directing quality of life considerations for future growth. The only street segment in proximity to the campus identified as a Scenic Corridor is North State College Boulevard, between Yorba Linda Drive and Rolling Hills Drive.

*City of Fullerton Scenic Corridor Design Guidelines*

Originally Appendix D of the 1994 General Plan Update, the Scenic Corridor Design Guidelines provide guidance for scenic corridor treatment and preservation, including preservation of the

natural grade and landscape, building design and viewshed protection, and preserving the pastoral qualities of rural streets.

### *City of Fullerton Municipal Code*

The City of Fullerton Municipal Code identifies land use categories, development standards, and other general provisions that ensure consistency between The Fullerton Plan and proposed development projects. The following provisions from the Municipal Code concern aesthetic features and design.

- **Title 9 (Parks), Chapter 9.06 (Community Forestry).** This chapter addresses the planning, planting, maintenance, and removal of trees and landscaping in the City, including street trees and certain trees on private property. It seeks to preserve the City’s urban forest in order to “enhance the City’s overall character and sense of place.” The ordinance establishes criteria, including aesthetic concerns, for the official designation of “landmark trees.”
- **Title 15 (Zoning), Section 15.15.055 (Design Review).** This section states that any request to develop property in the City may be subject to a review by the Design Review Committee (DRC) if the Director of Development Services determines that there are design issues that require a review to serve the public interest. The DRC’s recommendations are submitted to the Planning Commission and/or City Council prior to the making of a decision on the project.
- **Title 15 (Zoning), Chapter 15.47 (Site Plan Review).** This chapter identifies the set of factors that are contemplated by the Director of Development Services, Staff Review Committee and/or the Planning Commission when a site plan is reviewed, including aesthetic concerns such as visual buffering and screening, the relationship between buildings, and the appearance of landscaping.
- **Title 15 (Zoning), Chapter 14.49 (Sign Standards and Regulations).** This chapter regulates the size, height, design, quality of materials, construction, illumination, location, and maintenance of all signs and sign structures in the City.

## 4.1.3 Impact Analysis

### a. Thresholds of Significance

To determine whether a project would result in a significant impact to Aesthetics, Appendix G of the CEQA Guidelines requires consideration of whether a project would:

1. Have a substantial adverse effect on a scenic vista;
2. Substantially damage scenic resources, including but not limited to, trees, rock outcroppings, and historic buildings within a State Scenic Highway;
3. In nonurbanized areas, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality; or
4. Create a new source of substantial light or glare that would adversely affect daytime or nighttime views in the area.

## b. Methodology

The evaluation of potential aesthetic and visual resource impacts is based on review of site photographs representing key vantage points; the nature, scale, and design of Campus Master Plan projects; and documents pertaining to the campus and surrounding area. In determining the level of significance, this analysis focuses on the nature and magnitude of visual change associated with the development under the Campus Master Plan, the number of public vantage points from which changes would be visible, and the number of viewers who would be affected.

The following analysis identifies important, or “key,” views that could, theoretically, be noticeably altered by the Campus Master Plan. As recommended by the FHWA, these views are described according to view character and quality, the visual resources present, viewer group and viewer group sensitivity, as well as the duration of the views (1981). The terminology is described below.

- The character of a view is described by the topography, land uses, scale, form, and natural resources depicted in the view. The assessment of the visual character is descriptive and not evaluative because it is based on defined attributes.
- Visual quality refers to the aesthetics of the view. Determining the quality of a view can be subjective because it is based in part on the viewer’s values and notions about what constitutes a quality setting. In an effort to establish an objective framework, this assessment applies the evaluative criteria (i.e., vividness, intactness, and unity) and qualitative rankings (low, medium, and high) presented in the FHWA guidelines. Vividness is the visual power or memorability of landscape components as they combine in striking and distinctive visual patterns. Intactness is the visual integrity of the natural and man-made landscape and its freedom from encroaching elements. Unity is the visual coherence and compositional harmony of the landscape considered as a whole.
- Viewer response to a proposed project is predicted according to the land use and/or activities of the viewers, the relative number of viewers, and the amount of exposure to the view. Viewer groups/sensitivity refers to those who would see the project both during construction and after its completion and whether they would be likely to have a low, moderate, or high level of concern about aesthetic changes resulting from the project. It is presumed that residents who can see the project from their place of residence would have a relatively high level of sensitivity. By contrast, the typical motorist/commuter driving through the area to and from work or making deliveries is presumed to have a low level of sensitivity because attention is focused chiefly on driving or work-related activities.

It is assumed that projects implemented under the Campus Master Plan would comply with applicable CSU, CSUF, and other state policies, regulations, and procedures pertaining to development within the campus. This includes Campus Master Plan goals and policies related to visual siting, design, and quality of proposed projects.

## Campus Master Plan

The Plan highlights several key design considerations relevant to aesthetics and visual resources:

- Unobstructed views along axes should be maintained to improve the legibility of the campus.
- Edges should be well defined through the built form of through planting.
- All axes should be well lit with pedestrian-scaled lighting.
- Paving materials should be used to help designate the difference between secondary and tertiary axes.

- Academic buildings:
  - Would be up to six stories or 75 feet from the ground level to the top floor level, and 80-90 feet in width
  - Ground and upper floor heights shall be 15 feet floor-to-floor
  - Building width balances floor plan programming and opportunities for increased depth of daylight penetration
- Residential buildings:
  - Shall be up to seven stories or 75 feet from the ground level to the top floor level, and 40-45 feet in width
  - Ground floor heights shall be 15 feet floor-to-floor
  - Upper floor heights shall be 12 feet floor-to-floor
  - Depth of building footprint allows for efficient dorm layout and daylight penetration in occupied spaces
- Student-life programs shall be integrated into each academic and residential building planning program, with a special focus on the ground floor for activation purposes.
- Student-life program areas should have visual transparency to adjacent space and the outdoors.

### c. Impact Analysis

<b>Threshold 1:</b> Would the project have a substantial adverse effect on a scenic vista?
--

**Impact AES-1** PROPOSED DEVELOPMENT WOULD NOT SIGNIFICANTLY BLOCK OR IMPEDE VIEWS OF SCENIC VISTAS, NOR WOULD THE SCALE OF PROPOSED DEVELOPMENT SIGNIFICANTLY IMPACT VIEWS FROM IDENTIFIED SCENIC CORRIDORS. IMPACTS WOULD BE LESS THAN SIGNIFICANT. NO MITIGATION MEASURES ARE REQUIRED.

---

New development proposed under the Campus Master Plan would mainly be within the existing CSUF campus footprint. New construction outside of the existing campus would be limited to the proposed elevated pedestrian bridge that would span the Nutwood Avenue right-of-way. Scenic views of the hills and open space preserves are the predominant scenic vistas in the area, however no views of the Coyote Hills East Preserve or other open space preserves are currently accessible from CSUF on the street level. Distant northern views of the Los Angeles National Forest, South San Jose Hills, and Santa Ana Mountains are present at limited locations on the campus, mainly around athletic fields and other open spaces (see Figure 4.1-2, View 1). The existing limited views of distant mountains or foothills that are accessible on campus would not be impacted by Campus Master Plan, as the athletic fields would not be altered under the Campus Master Plan. Additionally, the Campus Master Plan would not substantially impact views of campus from areas of scenic enjoyment, since development under the Campus Master Plan would not include buildings or structures taller than existing buildings.

The Fullerton Arboretum, located in the northeastern portion of campus, contains landscaping features such as waterfalls, ponds, trails, and plant collections, provides a scenic landscape on campus. The Arboretum provides a scenic area of visual relief for students and staff and is accessible to the general public. Views of the Arboretum may be accessed from inside the residential hall buildings located on the east side of campus, but views of the Arboretum are not accessible from public vantage points on or off campus. Development proposed in the Fullerton Arboretum,

including 100,000 gross square feet of additional facility space, would not degrade the existing scenic views or visual character of the Arboretum. Improvements would be made to increase access to the Arboretum through the proposed Green Loop, including a potential entrance on its southern side. With increased access, the ability for students, faculty, and visitors to enjoy the scenic views in the Arboretum would potentially increase. Therefore, impacts on scenic vistas would be less than significant.

### Mitigation Measures

No mitigation required.

### Significance After Mitigation

Impacts would be less than significant without mitigation.

<b>Threshold 2:</b> Would the project substantially damage scenic resources, including but not limited to, trees, rock outcroppings, and historic buildings within a state scenic highway?
--

**Impact AES-2** THERE ARE NO STATE SCENIC HIGHWAYS IN THE VICINITY OF THE CAMPUS. THUS, IMPLEMENTATION OF THE CAMPUS MASTER PLAN WOULD NOT SIGNIFICANTLY DAMAGE SCENIC RESOURCES WITHIN A STATE SCENIC HIGHWAY. IMPACTS WOULD BE LESS THAN SIGNIFICANT. NO MITIGATION MEASURES ARE REQUIRED.

---

There are no officially designated scenic resources on or near the CSUF campus, and there are no State Scenic Highways in the vicinity of the campus (Caltrans 2019). Currently, motorists looking west on SR 57 near CSUF have a view consisting mostly of surface parking lots along the east side of campus. No distant and scenic views are available from this location. Therefore, development under the Campus Master Plan would not substantially damage scenic resources within a State Scenic Highway, and there would be no impact.

### Mitigation Measures

No mitigation required.

### Significance After Mitigation

There would be no impact and mitigation would not be required.

**Threshold 3:** Would the project, if in a nonurbanized area, substantially degrade the existing visual character or quality of public views of the site and its surroundings? (Public views are those that are experienced from publicly accessible vantage point). If the project is in an urbanized area, would the project conflict with applicable zoning and other regulations governing scenic quality?

**Impact AES-3** DEVELOPMENT UNDER THE CAMPUS MASTER PLAN WOULD CONSTRUCT NEW FACILITIES AND GREEN SPACE ON THE CSUF CAMPUS, RENOVATE EXISTING STRUCTURES. PHYSICAL CHANGES WOULD NOT DEGRADE THE VISUAL CHARACTER OF THE CAMPUS OR SURROUNDING AREAS. IMPACTS WOULD BE LESS THAN SIGNIFICANT. NO MITIGATION MEASURES ARE REQUIRED.

---

## Construction Impacts

Potential visual impacts would arise from intermittent construction activities (i.e., barricade installation, construction staging, and grading). Additionally, the presence of trucks with building materials and equipment would result in short-term visual impacts. However, these activities would be limited primarily to properties outside the campus, such as residences and schools on North State College Boulevard and commercial and educational facilities on Nutwood Boulevard. The majority of the construction work would be centralized to the campus interior. Additionally, while construction staging could be unsightly, it would be short in duration, phased over time, and not expected to pose a significant impact on sensitive viewers. It is assumed that construction would mainly be limited to daytime hours; and therefore, use of construction lighting would be minimal and no significant artificial lighting impacts are anticipated during construction.

## Visual Character

Existing visual quality of the campus is generally high, due to the existing high number of visual resources such as consistent architectural elements, landscaping, and resources such as the Arboretum. New development would be designed to activate student and faculty spaces on campus and enhance visual and physical connections within the campus and surrounding area. As described in Section 2.0, *Project Description*, new development under the Campus Master Plan would include four housing centers, 16 academic facilities, three transit hubs, innovation hub, event center, parking garage, Corporation yard/facilities, and new multi-modal pathways.

A number of new buildings and facilities would be replaced, including Jewel Plummer Cobb Residential Hall, Titan Bookstore, the Education Classroom Building, single-level Engineering buildings, Visual Arts buildings, Anthropology storage facility, Goodwin Field Press Box, Corporation Yard/Facilities Management buildings, and parts of the Kinesiology and Health Science Building.

New development and redevelopment of existing facilities would primarily impact the visual character of the CSUF campus from on-campus viewpoints, namely in the academic core and student housing areas on the eastern and western edges of campus. Proposed buildings range from two to seven stories. The tallest buildings would be primarily located in the central core of the campus. Academic buildings would be up to six stories and 80 to 90 feet wide, and residential buildings would be up to seven stories and 40 to 45 feet wide. Residential buildings developed under the Campus Master Plan would be higher and more densely populated but would also include open space courtyards and ground-floor transparency. The Campus Master Plan directs new building material and color choices to harmonize with exiting campus palettes.

New development would densify the campus due to increased building massing and height, but would be consistent with the large, rectangular style of existing buildings, particularly the modern aesthetic of the buildings developed after 2000. Entranceways would be oriented toward and visible from circulation paths, and be well-lit, inviting spaces, and may include cafes or other opportunities for students and others to congregate. The façade architecture of the ground floors of new buildings would connect people to the outdoor environment and allow for daylight penetration and views into the building. The proposed six-story faculty housing complex south of Nutwood Avenue would be consistent with the massing of existing College Park building and surrounding multi-family housing complexes and improve the visual continuity of the streetscape along North Commonwealth Avenue and College Place.

The Campus Master Plan also includes plans for enhanced entranceways with new architectural components and wayfinding signs on the south, north, and west sides of the main campus, a pedestrian bridge across Nutwood Avenue, and improved pedestrian and bicycle routes and green/open spaces. The Campus Master Plan would also develop the 20-foot-wide, oval-shaped Green Loop multi-modal pathway that will encircle the center of campus, and a network of 15- to 20-foot-wide pedestrian and bicycle “axes” that cut across campus. The Green Loop and axes would be primarily constructed upon a network of existing bicycle and pedestrian pathways, not all of which are currently connected, and would add landscaping and public art to define edges.

New facilities would be constructed in conformance with existing state and CSU guidelines and policies, including the CSU Outdoor Lighting Design Guidelines which state that the lighting aesthetic must compliment the campus architecture and should be consistent between similar areas across the campus. Sensitive viewers on campus include students, faculty, and staff, especially those residing on campus. Facility improvements and new developments would generally be consistent with the existing visual character on campus and would provide improvements to visual resources, such as increased green and open space. Therefore, the Campus Master Plan would not significantly degrade the visual quality for sensitive viewers on campus.

## Off-Campus Views

Proposed development under the Campus Master Plan would primarily impact off-campus public views looking towards campus from the main arterial streets such as North State College Boulevard, Yorba Linda Boulevard, and Nutwood Avenue. Based on location and duration of views, sensitive viewers include residents, students and employees at adjacent educational facilities, and employees at public and commercial facilities on Yorba Linda Boulevard and Nutwood Avenue.

### *Views from Yorba Linda Boulevard*

Southward views from sensitive viewers on Yorba Linda Boulevard (represented by Figure 4.1-2, Viewpoints 3 and 4) would not substantially change from the development of parking structures at the northern side of campus, as current views are low to moderate quality and consist mainly of parking areas and landscaping. The Campus Master Plan would add perimeter improvements and visual resources on this side of campus, including tree canopy, beautifying plant buffer along Yorba Linda Boulevard, and entranceway signage at Yorba Linda Boulevard and Campus Drive, as described in Section 2, *Project Description*. Existing views would be marginally improved by the Campus Master Plan and there would be no significant adverse impacts in this area.

### *Views from North State College Boulevard*

Visual quality on campus as seen from sensitive viewers along North State College Boulevard (represented by Figure 4.1-2, Viewpoints 1 and 2) is currently low to moderate in quality. The visual quality would improve from the development proposed under the Campus Master Plan, which would replace visually inconsistent single-story facilities with six and seven-story residential and academic buildings along the western edge of the main campus. The Campus Master Plan would also implement perimeter improvements, including tree canopy, beautifying plant buffer, and five points of art or signage on the length of North State College Boulevard between Yorba Linda Boulevard and Nutwood Avenue. This development North State would add visual resources, strengthen the visual connection of the campus with the street and surrounding off-campus community. While the development would be more intense in this area than along Yorba Linda Boulevard, development would be expected to enhance the visual quality through improved landscaping and unified architectural treatments.

A portion of North State College Boulevard is identified as a Scenic Corridor in The Fullerton Plan. However, the CSUF campus is not visible from this segment of North State College Boulevard except for a very limited view of a parking area on the northwestern corner of campus. Development associated with the Campus Master Plan would not interfere with publicly accessible viewsheds of North State College Boulevard or other identified scenic corridors. Existing views would be marginally improved by the Campus Master Plan and there would be no significant adverse impacts in this area.

### *Views from Nutwood Avenue*

Northward views from sensitive viewers Nutwood Avenue (represented by Figure 4.1-2, Viewpoints 5 and 7) would be the most impacted with development under the Campus Master Plan, mainly due to the addition of a footbridge from the southern area of the campus to the College Park building across the street. The addition of a new academic building and transit hub near Nutwood Avenue would increase connectivity to the street. Construction of the new footbridge (as seen on Figure 2-30 in Section 2.0, *Project Description*) would substantially change the eastern and western views on Nutwood Avenue (see Figure 4.1-2, Viewpoint 6 for eastern view). Nutwood Avenue is not an identified scenic road, and drivers along Nutwood are not considered sensitive viewers. Sensitive viewers include students, faculty, and staff and employees of commercial businesses along Nutwood Avenue, and the footbridge would impact existing views of the street. However, the footbridge would add an attractive visual element that in massing and style would be consistent with the visual character of elements along Nutwood Avenue, and therefore would not degrade existing visual character or scenic views.

A porous line of street trees would be planted along the campus perimeter with Nutwood Avenue to enable fluid movement, and the Campus Master Plan would add new art or signage at the entrance facing Commonwealth Avenue. As with other campus perimeters adjacent to local streets, the Campus Master Plan would be expected to enhance the visual quality of views looking toward campus.

### *Views from SR 57*

Views from SR 57 (represented by Figure 4.1-2, Viewpoint 8) are not scenic and generally low-quality. Additionally, drivers on non-scenic freeways are not considered sensitive viewers, since the duration of views are short. Although the Campus Master Plan would add two new student residence buildings, a new parking structure, and several academic buildings and an event center on

the eastern side of campus, westward views from SR 57 would not change substantially, as the existing row of tall trees would impede most views of the campus. There may be a minor improvement in visual quality with the development of the landscaped buffer proposed along the campus perimeter.

Overall, the Campus Master Plan would strengthen the visual connections from the main campus to the surrounding streets, enhance entranceways and landscaping, and improve visual resources and overall quality of views from sensitive viewers both on and off campus. New buildings would have similar massing, scale, and materials as existing modern buildings, and visual character of the campus would be maintained or improved. Construction impacts would be temporary and not substantially impact sensitive viewers. Therefore, the Campus Master Plan would have less than significant impacts on visual character and public views.

### Mitigation Measures

No mitigation required.

### Significance After Mitigation

Impacts would be less than significant without mitigation.

**Threshold 4:** Would the project create a new source of substantial light or glare that would adversely affect daytime or nighttime views in the area?

**Impact AES-4** IMPLEMENTATION OF THE CAMPUS MASTER PLAN WOULD LEAD TO MORE INTENSIVE DEVELOPMENT ON THE CAMPUS AND NEW SOURCES OF NIGHTTIME ILLUMINATION; HOWEVER, FUTURE DEVELOPMENT WOULD BE REQUIRED TO COMPLY WITH CAMPUS MASTER PLAN GUIDELINES, CSU GUIDELINES, AND CALIFORNIA POLICIES AND STANDARDS SPECIFICALLY DESIGNED TO REDUCE LIGHTING IMPACTS. ADHERENCE TO THESE POLICIES AND STANDARDS WOULD REDUCE LIGHT AND GLARE IMPACTS TO A LESS THAN SIGNIFICANT LEVEL. IMPACTS WOULD BE LESS THAN SIGNIFICANT. NO MITIGATION MEASURES ARE REQUIRED.

Implementation of the Campus Master Plan would create new light sources associated with new or remodeled residential and academic buildings, event center, innovation hub, parking garages, and lighting for pathways, signs, transit hubs, security, and pedestrian crossings.

The exterior or façade of facilities developed under the Campus Master Plan could include reflective surfaces such as glass and metal that have the potential to create glare. New sources of exterior lighting, which have the potential to create glare, would be subject to the development guidelines and policies of the California Energy Standards and the CSU system.

The Campus Master Plan provides the following guidance for limiting and reducing impacts from light and glare:

- Create a dense landscape buffer along the perimeter adjacent to SR 57 to block light pollution.
- Residential and academic buildings should be designed with ground-floor illumination from natural sunlight to the extent possible.

The campus is currently characterized by a moderate to high level of nighttime illumination to allow for nighttime operation of campus facilities and events, on-campus residential life, and safety/security purposes. The increase in light or glare as a result of the project would not be substantial, may not be noticeable from off-site locations, and would not adversely affect day or nighttime views in the area. Sensitive light and glare receptors in the City include residents. Those

residents most impacted would be the single-family homes bordering North State College Boulevard, approximately 103 feet east of campus. However, these houses face away from North State College Boulevard which backyards bordered by a concrete wall, which would limit impacts. Multi-family residences approximately 100 feet south and east of the proposed faculty and staff housing facility may experience an increase light or glare from exterior lighting and nighttime traffic from that project. On-campus residents in the student residence halls would experience an increase in nighttime lighting from increased development, but increases would not be substantially more than existing conditions.

However, existing CSU policies and guidelines included in the Campus Master Plan would reduce excessive light on campus and impacts on the surrounding community from light associated with existing development and new development under the Campus Master Plan. Therefore, impacts of the Campus Master Plan related to light and glare would be less than significant.

### **Mitigation Measures**

No mitigation required.

### **Significance After Mitigation**

Impacts would be less than significant without mitigation.

## 4.2 Air Quality

---

This section analyzes the potential air quality impacts associated with construction and operation of the Campus Master Plan, including from conflicts with applicable air quality plans, exceedance of air quality standards from criteria pollutant emissions, exposure of sensitive receptors to substantial pollutant concentrations, and odor emissions. The analysis in this section is based in part on modeling using the California Emissions Estimator Model (CalEEMod); modeling outputs are included in Appendix C of this document.

### 4.2.1 Environmental Setting

#### a. Existing Air Quality Setting

##### Local Climate and Meteorology

The California State university, Fullerton (CSUF) campus is located in the South Coast Air Basin (SCAB), which is bound by the Pacific Ocean to the west and the San Gabriel, San Bernardino, and San Jacinto Mountains to the north and east, and includes all of Orange County and the non-desert portions of Los Angeles, Riverside, and San Bernardino Counties, in addition to the San Geronio Pass area in Riverside County. The regional climate in the SCAB is semi-arid and is characterized by warm summers, mild winters, infrequent seasonal rainfall, moderate daytime onshore breezes, and moderate humidity. Air quality in the SCAB is primarily influenced by meteorology and a wide range of emissions sources, such as dense population centers, substantial vehicular traffic, and industry.

Air pollutant emissions in the SCAB are generated primarily by stationary and mobile sources. Stationary sources can be divided into two major subcategories: point and area sources. Point sources occur at a specific location and are often identified by an exhaust vent or stack. Examples include boilers or combustion equipment that produce electricity or generate heat. Area sources are widely distributed and include such sources as residential and commercial water heaters, painting operations, lawn mowers, agricultural fields, landfills, and some consumer products. Mobile sources refer to emissions from motor vehicles, including tailpipe and evaporative emissions, and are classified as either on-road or off-road. On-road sources may be legally operated on roadways and highways. Off-road sources include aircraft, ships, trains, and self-propelled construction equipment. Air pollutants can also be generated by the natural environment, such as when high winds suspend fine dust particles.

##### Air Quality Standards

The federal and state governments have established ambient air quality standards for the protection of public health. The United States Environmental Protection Agency (USEPA) is the federal agency designated to administer air quality regulation, while the California Air Resources Board (CARB) is the state equivalent in the California Environmental Protection Agency (CalEPA). County-level Air Pollution Control Districts (APCDs) provide local management of air quality. The South Coast Air Quality Management District (SCAQMD) is the designated air quality control agency in the SCAB. CARB has established air quality standards and is responsible for the control of mobile emission sources, while the local APCDs are responsible for enforcing standards and regulating stationary sources. CARB has established 14 air basins statewide.

The USEPA has set primary national ambient air quality standards (NAAQS) for ozone (O<sub>3</sub>), carbon monoxide (CO), nitrogen dioxide (NO<sub>2</sub>), sulfur dioxide (SO<sub>2</sub>), PM<sub>10</sub>, PM<sub>2.5</sub>, and lead (Pb). Primary standards are those levels of air quality deemed necessary, with an adequate margin of safety, to protect public health. In addition, California has established health-based ambient air quality standards for these and other pollutants, some of which are more stringent than the federal standards. Table 4.2-1 lists the current federal and state standards for regulated pollutants.

**Table 4.2-1 Federal and State Ambient Air Quality Standards**

Pollutant	Averaging Time	Federal Primary Standards	California Standard
Ozone	1-Hour	–	0.09 ppm
	8-Hour	0.070 ppm	0.070 ppm
Carbon Monoxide	8-Hour	9.0 ppm	9.0 ppm
	1-Hour	35.0 ppm	20.0 ppm
Nitrogen Dioxide	Annual	0.053 ppm	0.030 ppm
	1-Hour	0.100 ppm	0.18 ppm
Sulfur Dioxide	Annual	–	–
	24-Hour	–	0.04 ppm
	1-Hour	0.075 ppm	0.25 ppm
PM <sub>10</sub>	Annual	–	20 µg/m <sup>3</sup>
	24-Hour	150 µg/m <sup>3</sup>	50 µg/m <sup>3</sup>
PM <sub>2.5</sub>	Annual	12 µg/m <sup>3</sup>	12 µg/m <sup>3</sup>
	24-Hour	35 µg/m <sup>3</sup>	–
Lead	30-Day Average	–	1.5 µg/m <sup>3</sup>
	3-Month Average	0.15 µg/m <sup>3</sup>	–

ppm = parts per million

µg/m<sup>3</sup> = micrograms per cubic meter

Source: California Air Resource Board (CARB) 2016

SCAB is designated nonattainment for the federal and state one-hour and eight-hour ozone standards, the state PM<sub>10</sub> standard, the federal 24-hour PM<sub>2.5</sub> standard, and the state and federal annual PM<sub>2.5</sub> standard. SCAB is in attainment of all other federal and state standards.

### Air Quality Pollutants of Primary Concern

The federal and state clean air acts mandate the control and reduction of certain air pollutants. Under these laws, USEPA and CARB have established ambient air quality standards for certain criteria pollutants. Ambient air pollutant concentrations are affected by the rates and distributions of corresponding air pollutant emissions, and by the climate and topographic influences discussed above. Proximity to major sources is the primary determinant of concentrations of non-reactive pollutants, such as CO and suspended particulate matter. Ambient CO levels usually follow the spatial and temporal distributions of vehicular traffic. A discussion of each primary criterion pollutant is provided below.

### *Ozone*

Ozone is produced by a photochemical reaction (i.e., triggered by sunlight) between nitrogen oxides ( $\text{NO}_x$ ) and reactive organic gases (ROG).<sup>1</sup>  $\text{NO}_x$  is formed during the combustion of fuels, while ROG is formed during combustion and evaporation of organic solvents. Because ozone requires sunlight to form, it mostly occurs in substantial concentrations between the months of April and October.

Ozone is a pungent, colorless, toxic gas with direct health effects on humans including respiratory and eye irritation and possible changes in lung functions. Groups most sensitive to ozone include children, the elderly, people with respiratory disorders, and people who exercise strenuously outdoors.

### *Carbon Monoxide*

CO is an odorless, colorless gas and causes a number of health problems including fatigue, headache, confusion, and dizziness. The incomplete combustion of petroleum fuels in on-road vehicles and at power plants is a major cause of CO. CO is also produced during the winter from wood stoves and fireplaces. CO tends to dissipate rapidly into the atmosphere; consequently, violations of the state CO standards are associated generally with major roadway intersections during peak-hour traffic conditions.

Localized CO “hotspots” can occur at intersections with heavy peak-hour traffic. Specifically, hotspots can be created at intersections where traffic levels are sufficiently high that the local CO concentration exceeds the NAAQS of 35.0 ppm or the CAAQS of 20.0 ppm.

### *Nitrogen Dioxide*

$\text{NO}_2$  is a by-product of fuel combustion, with the primary source being motor vehicles and industrial boilers and furnaces. Nitric oxide is the principal form of nitrogen oxide produced by combustion, but nitric oxide reacts rapidly to form  $\text{NO}_2$ , creating the mixture of NO and  $\text{NO}_2$  commonly called  $\text{NO}_x$ . Nitrogen dioxide is an acute irritant. A relationship between  $\text{NO}_2$  and chronic pulmonary fibrosis may exist, and an increase in bronchitis may occur in young children at concentrations below 0.3 ppm. Nitrogen dioxide absorbs blue light and causes a reddish brown cast to the atmosphere and reduced visibility. It can also contribute to the formation of  $\text{PM}_{10}$  and acid rain.

### *Suspended Particulate Matter*

$\text{PM}_{10}$  is particulate matter measuring no more than 10 microns in diameter;  $\text{PM}_{2.5}$  is fine particulate matter measuring no more than 2.5 microns in diameter. Suspended particulates are mostly dust particles, nitrates, and sulfates. Both  $\text{PM}_{10}$  and  $\text{PM}_{2.5}$  are by-products of fuel combustion and wind erosion of soil and unpaved roads and are directly emitted into the atmosphere through these processes. Suspended particulates are also created in the atmosphere through chemical reactions. The characteristics, sources, and potential health effects associated with the small particulates (those between 2.5 and 10 microns in diameter) and fine particulates (those 2.5 microns and below) can be very different.

---

<sup>1</sup> Organic compound precursors of ozone are routinely described by a number of variations of three terms: hydrocarbons (HC), organic gases (OG), and organic compounds (OC). These terms are often modified by adjectives such as total, reactive, or volatile, and result in a rather confusing array of acronyms: HC, THC (total hydrocarbons), RHC (reactive hydrocarbons), TOG (total organic gases), ROG (reactive organic gases), TOC (total organic compounds), ROG (reactive organic compounds), and VOC (volatile organic compounds). While most of these differ in some significant way from a chemical perspective, two groups are important from an air quality perspective: non-photochemically reactive in the lower atmosphere, or photochemically reactive in the lower atmosphere (HC, RHC, ROG, and VOC).

The small particulates generally come from windblown dust and dust kicked up by mobile sources. The fine particulates are generally associated with combustion processes, and form in the atmosphere as a secondary pollutant through chemical reactions. Fine particulate matter is more likely to penetrate deeply into the lungs and poses a health threat to all groups, but particularly to the elderly, children, and those with respiratory problems. More than half of the small and fine particulate matter inhaled into the lungs remains there. These materials can damage health by interfering with the body's mechanisms for clearing the respiratory tract or by acting as carriers of an absorbed toxic substance.

### *Toxic Air Contaminants*

The California Health and Safety Code defines a toxic air contaminant (TAC) as "an air pollutant which may cause or contribute to an increase in mortality or in serious illness, or which may pose a present or potential hazard to human health." The majority of the estimated health risks from TACs can be attributed to relatively few compounds, the most important being diesel particulate matter (DPM) from diesel-fueled engines. According to CARB, diesel engine emissions are believed to be responsible for about 70 percent of California's estimated known cancer risk attributable to TACs and they make up about 8 percent of outdoor PM<sub>2.5</sub> (CARB 2016b).

### *Lead*

Lead (Pb) is a metal found in the environment and in manufacturing products. The major sources of Pb emissions historically have been mobile and industrial sources. In the early 1970s, the USEPA set national regulations to gradually reduce the lead content in gasoline. In 1975, unleaded gasoline was introduced for motor vehicles equipped with catalytic converters. The USEPA completed the ban prohibiting the use of leaded gasoline in highway vehicles in December 1995. As a result of the USEPA's regulatory efforts to remove lead from gasoline, atmospheric lead concentrations have declined substantially over the past several decades. The most dramatic reductions in lead emissions occurred prior to 1990 due to the removal of lead from gasoline sold for most highway vehicles. Lead emissions were further reduced substantially between 1990 and 2008, with reductions occurring in the metals industries at least in part as a result of national emissions standards for hazardous air pollutants (USEPA 2013). Because of phasing out leaded gasoline, metal processing is now the primary source of lead emissions. The highest level of lead in the air is found generally near lead smelters. Other stationary sources include waste incinerators, utilities, and lead-acid battery manufacturers.

## **Current Air Quality**

The SCAQMD operates a network of air quality monitoring stations throughout the SCAB. The purpose of the monitoring stations is to measure ambient concentrations of pollutants and determine whether ambient air quality meets the California and federal standards. The monitoring station located closest to the project is the Anaheim-Pampas Lane station, located at 1630 W. Pampas Lane, Anaheim, approximately 4.5 miles southwest of the project site. Table 4.2-2 indicates the number of day that each of the air quality standards have been exceeded at the Anaheim-Pampas Lane station.

**Table 4.2-2 Ambient Air Quality at the Anaheim Pampas Lane Monitoring Station**

Pollutant	2016	2017	2018
8-Hour Ozone (ppm), 8-Hour Maximum	0.074	0.076	0.071
Number of Days of State exceedances (>0.070)	4	4	1
Number of days of Federal exceedances (>0.070)	4	4	1
Ozone (ppm), 1-Hour Maximum	0.103	0.090	0.112
Number of days of State exceedances (>0.09 ppm)	2	0	1
Number of days of Federal exceedances (>0.112 ppm)	0	0	0
Nitrogen Dioxide (ppb) - 1-Hour Maximum	64.3	81.2	66.0
Number of days of State exceedances (>0.18 ppm)	0	0	0
Number of days of Federal exceedances (0.10 ppm)	0	0	0
Particulate Matter 10 microns, $\mu\text{g}/\text{m}^3$ , 24-Hour Maximum	74.0	95.7	94.6
Number of days above Federal standard (>150 $\mu\text{g}/\text{m}^3$ )	0	0	0
Particulate Matter <2.5 microns, $\mu\text{g}/\text{m}^3$ , 24-Hour Maximum	44.4	53.9	63.1
Number of days above Federal standard (>35 $\mu\text{g}/\text{m}^3$ )	1	7	7

Source: CARB 2019

## Sensitive Receptors

Ambient air quality standards have been established to represent the levels of air quality considered sufficient, with a margin of safety, to protect public health and welfare. They are designed to protect that segment of the public most susceptible to respiratory distress, such as children under 14, the elderly over 65, persons engaged in strenuous work or exercise, and people with cardiovascular and chronic respiratory diseases. The majority of sensitive receptor locations are, therefore, schools, hospitals, and residences.

## 4.2.2 Regulatory Setting

### Federal

#### *Federal Clean Air Act*

The USEPA is charged with implementing national air quality programs. USEPA's air quality mandates are drawn primarily from the federal Clean Air Act (CAA), passed in 1963 by the U.S. Congress and amended several times. The 1970 federal CAA amendments strengthened previous legislation and laid the foundation for the regulatory scheme of the 1970s and 1980s. In 1977, Congress again added several provisions, including non-attainment requirements for areas not meeting NAAQS and the Prevention of Significant Deterioration program. The 1990 federal CAA amendments represent the latest in a series of federal efforts to regulate air quality in the United States. The federal CAA allows states to adopt more stringent standards or to include additional pollution species.

### *National Ambient Air Quality Standards*

The federal CAA requires USEPA to establish primary and secondary NAAQS for a number of criteria air pollutants. The air pollutants for which standards have been established are considered the most prevalent air pollutants known to be hazardous to human health. NAAQS have been established for ozone, CO, NO<sub>2</sub>, SO<sub>2</sub>, PM<sub>10</sub>, PM<sub>2.5</sub>, and Pb.

## **State**

### *California Clean Air Act*

The California CAA, signed into law in 1988, requires all areas of the state to achieve and maintain the CAAQS by the earliest practical date. CARB is the state air pollution control agency and is a part of CalEPA. CARB is the agency responsible for coordination and oversight of state and local air pollution control programs in California, and for implementing the requirements of the California CAA. CARB oversees local district compliance with federal and California laws, approves local air quality plans, submits the state implementation plans to the USEPA, monitors air quality, determines and updates area designations and maps, and sets emissions standards for new mobile sources, consumer products, small utility engines, off-road vehicles, and fuels.

### *California Ambient Air Quality Standards*

The California CAA requires CARB to establish CAAQS. Similar to the NAAQS, CAAQS have been established for ozone, CO, NO<sub>2</sub>, SO<sub>2</sub>, PM<sub>10</sub>, PM<sub>2.5</sub>, Pb, vinyl chloride, hydrogen sulfide, sulfates, and visibility-reducing particulates. In most cases, the CAAQS are more stringent than the NAAQS. The California CAA requires all local air districts to endeavor to achieve and maintain the CAAQS by the earliest practical date. The California CAA specifies that local air districts should focus attention on reducing the emissions from transportation and area-wide emission sources and provides districts with the authority to regulate indirect sources.

## **Regional and Local**

### *Southern California Association of Governments*

The Southern California Association of Governments (SCAG) is a regional planning agency that serves as a forum for regional issues relating to transportation, economics, community development, and environmental issues. SCAG is not an air quality management agency, but it is responsible for development transportation, land use, and energy conservation measures that impact air quality. SCAG's Regional Comprehensive Plan and Guide provide growth forecasts used by SCAQMD to develop air quality and land use strategies (SCAG 2008). SCAG is charged with developing and implementing Senate Bill 375, a measure that addresses greenhouse gas reduction in the state, with participation from Riverside County and the other cities and counties that make up SCAG.

### *South Coast Air Quality Management District Air Quality Management Plan*

The SCAQMD is required to prepare a plan for air quality improvement for pollutants for which the District is in non-compliance. The District's Air Quality Management Plan (AQMP) is updated every three years, and each update has a 20-year horizon. The 2016 AQMP was adopted on March 3, 2017 and incorporated new scientific data and notable regulatory actions that have come about since

adoption of the 2012 AQMP, including the approval of the new federal eight-hour ozone standard of 0.070 ppm that was finalized in 2015 (SCAQMD 2017).

The 2016 AQMP addresses several federal and state planning requirements and incorporates new scientific information, primarily in the form of updated emissions inventories, ambient measurements, and updated meteorological air quality models (SCAQMD 2017). The 2016 AQMP builds upon the approaches taken in the 2012 AQMP for the attainment of federal particulate matter and ozone standards and highlights the significant reductions to be achieved. It emphasizes the need for interagency planning to identify strategies to achieve reductions within the timeframes allowed under the federal CAA, especially in the area of mobile sources. The 2016 AQMP also includes a discussion of emerging issues and opportunities, such as fugitive toxic particulate emissions, zero-emission mobile source control strategies, and the interacting dynamics among climate, energy, and air pollution. The AQMP includes attainment demonstrations of the new federal eight-hour ozone standard and vehicle miles traveled emissions offsets, according to recent USEPA requirements.

### *The Fullerton Plan*

The Air Quality and Climate Change Element of the Fullerton Plan recognizes the importance of achieving the regional air quality objectives. The Fullerton Plan seeks to protect the well-being of citizens within the City of Fullerton through improvement of air quality. The Fullerton Plan includes the following goals and policies related to air quality:

**Goal 5:** A balanced system promoting transportation alternatives that enable mobility and an enhanced quality of life.

**Policy 5.16:** Support projects, programs, policies and regulations to encourage the development of private and/or public infrastructure facilitating the use of alternative fuel vehicles.

**Goal 6:** A bicycle-friendly city where bicycling is a safe and convenient alternative to motorized transportation and a recreational opportunity for people of all ages and abilities.

**Policy 6.1:** Support regional and subregional efforts to ensure bicyclists are considered when developing new or retrofitting existing transportation facilities and systems.

**Policy 6.7:** Support projects, programs, policies, and regulations to reduce negative impacts to and increase opportunities for bicycle users and the bicycle network in private and public development projects.

**Policy 6.12:** Support projects, programs, policies, and regulations to provide convenient bicycle parking and other bicycle facilities in existing and potential high demand locations within the City, such as educational institutions, parks, business districts, transit stops, retail, commercial and employment centers.

**Policy 6.14:** Support projects, programs, policies and regulations to consider bicycle friendly design using new technologies and innovative treatments.

**Goal 21:** Protection and improvement of Air Quality

**Policy 21.4:** Support projects, programs, policies and regulations to promote a balance of residential, commercial, industrial, recreational and institutional uses located to provide options to reduce vehicle trips and vehicle miles traveled.

**Policy 21.6:** Support projects, programs, policies and regulations to reduce impacts to air quality caused by private and public construction projects.

**Policy 21.7:** Support projects, programs, policies and regulations to reduce impacts to air quality caused by the design or operation of a site or use.

### 4.2.3 Impact Analysis

#### a. Thresholds of Significance

To determine whether a project would result in a significant impact to air quality, Appendix G of the CEQA Guidelines requires consideration of whether a project would:

1. Conflict with or obstruct implementation of the applicable air quality plan
2. Result in a cumulatively considerable net increase of any criteria pollutant for which the project region is in non-attainment under an applicable federal or state ambient air quality standard
3. Expose sensitive receptors to substantial pollutant concentrations
4. Result in other emissions (such as those leading to odors) adversely affecting a substantial number of people

#### *Regional Significance Thresholds*

The SCAQMD recommends quantitative regional significance thresholds for temporary construction activities and long-term project operation in the SCAB, shown in Table 4.2-3.

**Table 4.2-3 SCAQMD Regional Significance Thresholds**

Construction Thresholds	Operational Thresholds
75 pounds per day of ROG	55 pounds per day of ROG
100 pounds per day of NO <sub>x</sub>	55 pounds per day of NO <sub>x</sub>
550 pounds per day of CO	550 pounds per day of CO
150 pounds per day of SO <sub>x</sub>	150 pounds per day of SO <sub>x</sub>
150 pounds per day of PM <sub>10</sub>	150 pounds per day of PM <sub>10</sub>
55 pounds per day of PM <sub>2.5</sub>	55 pounds per day of PM <sub>2.5</sub>

Source: SCAQMD 2015

#### *Localized Significance Thresholds*

In addition to the above regional thresholds, the SCAQMD has developed Localized Significance Thresholds (LSTs) in response to the Governing Board’s Environmental Justice Enhancement Initiative (1-4), which was prepared to update the *CEQA Air Quality Handbook* (1993). LSTs were devised in response to concern regarding exposure of individuals to criteria pollutants in local communities and have been developed for NO<sub>x</sub>, CO, PM<sub>10</sub>, and PM<sub>2.5</sub>. LSTs represent the maximum emissions from a project that will not cause or contribute to an air quality exceedance of the most stringent applicable federal or state ambient air quality standard at the nearest sensitive receptor, taking into consideration ambient concentrations in each source receptor area (SRA), distance to the sensitive receptor, and project size. LSTs have been developed for emissions within construction areas up to five acres in size. However, LSTs only apply to emissions in a fixed stationary location and are not applicable to mobile sources, such as cars on a roadway (SCAQMD 2008). As such, LSTs

are typically applied only to construction emissions because the majority of operational emissions are associated with project-generated vehicle trips.

The SCAQMD provides LST lookup tables for project sites that measure one, two, or five acres. Overall project construction would occur over several hundred acres, and each phase modeled (described below under *Methodology*) would cover an area that exceeds five acres. Therefore, the LST analysis conservatively uses five-acre LSTs. LSTs are provided for receptors at a distance of 82 to 1,640 feet from the project disturbance boundary to the sensitive receptors. The border of construction activity would occur approximately 50 feet nearest to on-site sensitive receptors and 75 feet to off-site sensitive (multi-family residential buildings). According to the SCAQMD’s publication, *Final LST Methodology*, projects with boundaries located closer than 82 feet to the nearest receptor should use the LSTs for receptors located at 82 feet. Therefore, the analysis below uses the LST values for 82 feet. In addition, the project is located in SRA 16 (North Orange County). LSTs for construction in SRA 16 on a 5-acre site with a receptor 82 feet away are shown in Table 4.2-4.

**Table 4.2-4 SCAQMD LSTs for Construction (SRA 11)**

Pollutant	Allowable Emissions for a 5-acre Site in SRA 16 for a Receptor 82 Feet Away (lbs/day)
Gradual conversion of NO <sub>x</sub> to NO <sub>2</sub>	221
CO	1,311
PM <sub>10</sub>	11
PM <sub>2.5</sub>	6

Source: SCAQMD 2009

### *Health Risk Thresholds*

SCAQMD has developed significance thresholds for the emissions of TACs based on health risks associated with elevated exposure to such compounds. For carcinogenic compounds, cancer risk is assessed in terms of incremental excess cancer risk. A project would result in a potentially significant impact if it would generate a Maximum Incremental Cancer Risk of 10 in 1 million or a cancer burden of 0.5 excess cancer cases in areas exceeding 1 in 1 million risk. Additionally, non-carcinogenic health risks are assessed in terms of a Hazard Index. A project would result in a potentially significant impact if it would result in a chronic and acute Hazard Index greater than 1.0 (SCAQMD 2015).

### **b. Methodology**

Criteria pollutant and GHG emissions for project construction and operation were calculated using the CalEEMod, Version 2016.3.2. CalEEMod is a statewide land use emissions computer model designed to provide a uniform platform for government agencies, land use planners, and environmental professionals to quantify potential criteria pollutant and GHG emissions associated with both construction and operations from a variety of land use projects. The model was developed by BREEZE Software for the California Air Pollution Control Officers Association (CAPCOA) in collaboration with the California air districts. CalEEMod allows for the use of standardized data (e.g., emission factors, trip lengths, meteorology, source inventory) provided by the various California air districts to account for local requirements and conditions, and/or user-defined inputs. The model calculates criteria pollutant emissions and GHGs emissions, reported as CO<sub>2</sub>e (discussed

further in Section 4.7, *Greenhouse Gas Emissions*). The calculation methodology and input data used in CalEEMod can be found in the CalEEMod User's Guide Appendices A, D, and E (CAPCOA 2017). The input data and subsequent construction and operation emission estimates for the project are detailed in the following discussion. CalEEMod output files for the project are included in Appendix C of the EIR.

### *Construction Emissions*

Project construction would primarily generate temporary criteria pollutant and GHG emissions from construction equipment operation on-site, construction worker vehicle trips to and from the site, and from export of materials off-site. Construction input data for CalEEMod include but are not limited to: (1) the anticipated start and finish dates of construction activity; (2) inventories of construction equipment to be used; (3) areas to be excavated and graded; and (4) volumes of materials to be exported from and imported to the project site. The analysis assessed maximum daily emissions from individual construction activities, including demolition and site preparation, grading, building construction, paving, and architectural coating. Construction equipment estimates are based on surveys of construction projects within California conducted by members of CAPCOA (CAPCOA 2017). Diesel welders were removed from CalEEMod default construction list for building construction because they would not be anticipated to be used in construction; instead, electric welders are more common in modern construction and these would be covered by a generator set during the building construction phase.

Projects were not included in the modeling that were previously approved under the 2003 Campus Master Plan, that are currently under construction or funded through the CSUF Five-Year Capital Plan, and/or that have previously undergone environmental review. Projects under the approximately 5 million square feet of total new construction identified in Section 2, *Project Description*, were included in the modeling. It was assumed that construction of these projects would begin in 2024 to allow for construction of the previously approved projects and construction would continue until approximately 2039. For modeling purposes, it was assumed that these remaining projects would be completed in three phases, with the first phase occurring from 2024 to 2029, the second phase occurring from 2030 to 2034, and the third phase occurring from 2035 to 2039. Each phase was modeled as one large construction project; i.e., each phase was modeled with a demolition, site preparation, grading, building construction, paving, and architectural coating phases that occur sequentially where all buildings are constructed at once, graded at once, etc. This is a conservative approach as it assumes a continuous, intensive construction scenario. The default construction phase lengths were modified in certain phases to accommodate the phase lengths and buildout year of 2039.

The academic space and campus amenity square footage was divided between the three phases. It was assumed that the housing portions (both student and faculty) and event center would be constructed during the first phase. It was assumed that two parking structures would be constructed in the latter two phases, with each structure having a square footage of 838,688 square feet. With these assumptions, this would result in development intensities of approximately 2.2 million square feet during the Phase 1 (2024 to 2029), and 1.5 million square feet during Phase 2 (2030 to 2034) and Phase 3 (2035 to 2039). This would equate to an annual development intensity of approximately 367,000 sf during Phase 1 and 300,000 sf during Phases 2 and 3. This is a conservative assumption as it frontloads more development during earlier years where CalEEMod assumes higher emissions for construction equipment (i.e., as time progresses, construction equipment is assumed to be more efficient and result in lower emissions). It should be noted that the sequencing and phasing of proposed construction is only a prediction and is ultimately subject

to funding, demand, etc. Project-specific information used in model assumptions is based on information at this stage of planning; the information is preliminary and subject to change when specific individual projects are undertaken. The analysis is presented as a reasonable, conservative scenario of potential project impacts given available information. It is possible that later Campus Master Plan years include a higher development intensity than earlier years; however, by performing the analysis where higher development intensities occur in earlier years, the emissions estimates are more conservative.

Components identified in the Campus Master Plan as “renovation” or “open space” were not included in the CalEEMod modeling; these activities were assumed to not involve heavy construction equipment and would result in negligible construction emissions compared to demolition and construction activities of new components.

The amount of demolition for each phase was estimated by determining the buildings to be demolished for each building in each phase and measuring the building footprint square footage for each building to be demolished on Google Earth. The footprint square footage was then multiplied by the number of floors for each building to determine the total square footage to be demolished. The amount of import and export of soil for each phase was estimated by assuming a 20-foot cut depth for each new building’s square footage, and then assuming 50 percent of that soil would be exported and 50 percent imported.

CalEEMod has the capability to calculate reductions in construction emissions from the effects of dust control, diesel-engine classifications, and other selected emissions reduction measures. Emissions calculations assume application of water during grading and a 15-mph speed limit on unpaved surfaces in compliance with SCAQMD Rule 403, Fugitive Dust (as detailed in Section 2, *Project Description*), and use of architectural coatings with a VOC content of 50 g/L in compliance with SCAQMD Rule 1113. Based on CalEEMod version 2016.3.2, the PM<sub>10</sub> and PM<sub>2.5</sub> reduction for watering two times per day is 55 percent. In addition, as detailed in Section 2, Campus Master Plan projects would require use of at Tier 4 Final or more stringent construction equipment; Tier 4 equipment was included in the modeling.

### *Operational Emissions*

In CalEEMod, operational sources of criteria pollutant emissions include area, energy, and mobile sources. These sources are described below.

#### **ENERGY SOURCES**

Emissions from energy use that generate criteria pollutant emissions include natural gas use. The emissions factors for natural gas combustion are based on USEPA’s AP-42 (*Compilation of Air Pollutant Emissions Factors*) and California Climate Action Registry (CCAR) General Reporting Protocol (CCAR 2009). Electricity emissions only apply to GHG emissions (as discussed in Section 4.7, *Greenhouse Gas Emissions*, of this EIR) as the energy is generated off-site and therefore may not be relevant for local and regional air quality conditions.

#### **AREA SOURCES**

Emissions associated with area sources, including space and water heating, consumer products, landscape maintenance, and architectural coating were calculated in CalEEMod and utilize standard emission rates from CARB, USEPA, and emission factor values provided by the local air district (CAPCOA 2017).

## MOBILE SOURCES

Mobile source emissions are generated by the increase in vehicle trips to and from the project site associated with operation of onsite development. Baseline vehicle trips for the project were calculated using the Institute of Transportation Engineers (ITE) trip generation rates included in CalEEMod for each proposed land use. Baseline trip rates were then adjusted to account for the project-generated vehicle miles traveled (VMT) as determined by the project's Transportation Impact Study (TIS; Appendix M). The TIS determined that the project-generated VMT per service population would be 14.38 miles; this rate would be for the weekdays when students and employees are commuting to school. Assuming 261 weekdays per year with 8,000 people in the service population (4,000 commuter students, 3,000 resident students, and 1,000 employees), this would result in 30,025,440 annual VMT on weekdays. Due to the school use, for Saturday and Sunday trips and therefore VMT would be reduced. The proportion of trips on these days compared to the weekdays in CalEEMod was used to reduce the VMT accordingly;<sup>2</sup> therefore, 4,997,935 annual VMT would be generated on the 52 Saturdays in a year, and 1,976,785 VMT would be generated on the 52 Sundays in a year. Total project annual VMT was estimated at 37,000,160 VMT, and the CalEEMod output was modified to reflect this VMT total.

### c. Impact Analysis

<b>Threshold 1:</b> Would the project conflict with or obstruct implementation of the applicable air quality plan?
--

**IMPLEMENTATION OF THE CAMPUS MASTER PLAN WOULD NOT GENERATE POPULATION, HOUSING, OR EMPLOYMENT GROWTH EXCEEDING FORECASTS IN THE 2016 AQMP. HOWEVER, PROJECT OPERATION WOULD EXCEED THE SCAQMD THRESHOLDS FOR OZONE PRECURSORS (ROG AND NO<sub>x</sub>) ON WHICH THE AQMP BASES ATTAINMENT STRATEGIES AND MEASURES. THIS IMPACT WOULD BE SIGNIFICANT AND UNAVOIDABLE. FOLLOWING MITIGATION, IMPACTS WOULD STILL BE SIGNIFICANT AND UNAVOIDABLE.**

---

A project may be inconsistent with the AQMP if it would generate population, housing, or employment growth exceeding forecasts used in the development of the AQMP. The 2016 AQMP, the most recent AQMP adopted by the SCAQMD, incorporates local city general plans and the SCAG's 2016 RTP/SCS socioeconomic forecast projections of regional population, housing, and employment growth.

The updated growth forecasts in SCAG's 2016 RTP/SCS estimate that the population of the City of Fullerton would be 160,500 in 2040, up 22,500 people from a population of 145,700. The Campus Master Plan would involve an increase of 7,000 full time equivalent students (FTES) (from 25,000 to 32,000 FTES) and 1,000 faculty. This increase in population would be within the SCAG's projected 2040 population increase of 14,800 from 2020; in addition, many of these students and faculty would already be living within the City of Fullerton. Therefore, implementation of the Campus Master Plan would not cause the City of Fullerton to exceed official regional population projections.

The household growth forecasts in SCAG's 2016 RTP/SCS estimate that the total number of households would increase from 48,800 in 2020 to 55,200 in 2040, for an increase of 6,400. For purposes of this analysis, the Campus Master Plan would increase the number of student beds by

---

<sup>2</sup> For the student housing uses, Saturdays and Sundays would have 96 percent and 88 percent of the weekday total, respectively; for the university uses, Saturdays and Sundays would have 76 percent and zero percent of the weekday total, respectively.

---

2,400 and faculty housing units by 350<sup>3</sup>. This increase in households would be within SCAG's project 2040 household increase of 6,400 from 2020, and the project would not cause the City of Fullerton to exceed official regional household projections.

The employment growth forecasts in SCAG's 2016 RTP/SCS for the City of Fullerton estimate that the total number of jobs would increase from 78,000 in 2020 to 94,100 in 2040, for an increase of 16,100 jobs. The increase in employment anticipated from the Campus Master Plan of 1,000 would be within the SCAG's project 2040 employment increase of 16,100 jobs from 2020, and the project would not cause the City of Fullerton to exceed official regional employment projections.

Further in support of SCAG's overall goals in the 2016 RTP/SCS, the project would increase student housing opportunities on campus, which would work to reduce long commuter trips and area-wide congestion. The project is consistent with SCAG's growth projections and land use policies, including the policies of focusing growth and development within urban areas, encouraging infill development, and re-using previously developed urban land. CSUF implements, and would continue to implement pursuant through the Campus Master Plan, numerous programs and policies to improve air quality in the region, including Transportation Demand Management (TDM) measures that would reduce vehicle trips and minimizing energy use through project design.

The AQMP provides strategies and measures to reach attainment with the thresholds for 8-hour and 1-hour ozone and PM<sub>2.5</sub>. As shown in Table 4.2-5, project construction would not generate criteria pollutant emissions that would exceed SCAQMD thresholds for ozone precursors (ROG and NO<sub>x</sub>) and PM<sub>2.5</sub>. However, as shown in Table 4.2-6, project operation would exceed SCAQMD thresholds for ozone precursors. Therefore, although implementation of the project would not generate population, housing, or employment growth exceeding forecasts used in the development of the 2016 AQMP, project operation would exceed the SCAQMD thresholds for ozone that the AQMP provides strategies and measures to reach attainment with. Impacts would be potentially significant.

## Mitigation Measures

See mitigation measures under Impact AQ-2 below.

## Significance After Mitigation

With implementation of mitigation, project operation would still exceed SCAQMD thresholds for ozone precursors (ROG and NO<sub>x</sub>). Therefore, the project would result in **significant and unavoidable** impacts. Further discussion is provided to connect the project's air quality impacts to likely health consequences with the unmitigable impacts under Impact AQ-2 below.

---

<sup>3</sup> Approximately 600 of the proposed 3,000 student housing beds were evaluated under the 2003 Master Plan and are the subject of separate environmental review. Therefore, these 600 beds are not included in this environmental analysis.

**Threshold 2:** Would the project result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard?

CONSTRUCTION OF THE CAMPUS MASTER PLAN WOULD NOT GENERATE POLLUTANTS IN QUANTITIES THAT EXCEED SCAQMD SIGNIFICANCE THRESHOLDS. OPERATION WOULD EXCEED SCAQMD THRESHOLDS FOR ROG AND NO<sub>x</sub>. THIS IMPACT WOULD BE SIGNIFICANT AND UNAVOIDABLE. FOLLOWING MITIGATION, IMPACTS WOULD STILL BE SIGNIFICANT AND UNAVOIDABLE.

---

In accordance with CEQA Guidelines Section 15064(h)(3), the SCAQMD's approach for assessing cumulative impacts is based on the AQMP forecasts of attainment of ambient air quality standards in accordance with the requirements of the federal and State CAAs. If a project's mass regional emissions do not exceed the applicable SCAQMD, then the project's criteria pollutant emissions would not be cumulatively considerable.

On December 24, 2018, the California Supreme Court (Court) addressed the standard of review for claims challenging the legal sufficiency of an EIR's discussion of environmental impacts in *Sierra Club v. County of Fresno* (Friant Ranch, L.P.) (2018). In affirming in part the Court of Appeal's judgment, the Supreme Court held that the EIR for the Friant Ranch Project—a 942-acre master-planned, mixed-use development with over 2,500 senior residential units, 250,000 square feet of commercial space, and extensive open space/ recreational amenities on former agricultural land in north central Fresno County—was deficient in its informational discussion of the human health impacts of the Friant Ranch Project's significant and unavoidable impacts related to air quality.

The Court concluded that an EIR's discussion must: (1) "include sufficient detail to enable those who did not participate in its preparation to understand and to consider meaningfully the issues the project raises" (citing *Laurel Heights Improvement Assn. v. Regents of University of California* (1988) 47 Cal.3d 376, 405 ("Laurel Heights I")); and (2) "make a reasonable effort to substantively connect a project's air quality impacts to likely health consequences." It held that the Friant Ranch Project EIR did neither, and "should be revised to relate the expected adverse air quality impacts to likely health consequences or explain in meaningful detail why it is not feasible at the time of drafting to provide such an analysis, so that the public may make informed decisions regarding the costs and benefits of the project."

The following discussion provides additional information on the health consequences of ozone to what was discussed earlier in this section, and a discussion of the infeasibility to provide a quantitative analysis that connects ozone-related health impacts from the project to the immediate site area.

### *Health Consequences of Ozone*

A summary discussion of air pollution and potential health effects was provided in Section 4.2.1. In addition, the national and state criteria pollutants and the applicable ambient air quality standards were also provided in Section 4.2.1. As stated above, air pollution is a major public health concern and the adverse health effects associated with air pollution are diverse. Ozone is a pungent, colorless, toxic gas with direct health effects on humans, including respiratory and eye irritation and possible changes in lung functions and groups most sensitive to ozone include children, the elderly, persons with respiratory disorders, and people who exercise strenuously outdoors.

The adverse effects reported with short-term ozone exposure are greater with increased activity because activity increases the breathing rate and the volume of air reaching the lungs, resulting in

an increased amount of ozone reaching the lungs. Children may be a particularly vulnerable population to air pollution effects because they spend more time outdoors, are generally more active, and have a higher ventilation rate than adults. A number of adverse health effects associated with ambient ozone levels have been identified from laboratory and epidemiological studies. These include increased respiratory symptoms, damage to cells of the respiratory tract, decreases in lung function, increased susceptibility to respiratory infection, and increased risk of hospitalization.

The Children's Health Study, conducted by researchers at the University of Southern California, followed a cohort of children that live in 12 communities in southern California with differing levels of air pollution for several years. A publication from this study found that school absences in fourth graders for respiratory illnesses were associated with ambient ozone levels. An increase of 20 ppb ozone was associated with an 83 percent increase in illness-related absence rates (Gilliland et al. 2004). The number of hospital admissions and emergency room visits for all respiratory causes (infections, respiratory failure, chronic bronchitis, etc.) including asthma show a consistent increase as ambient ozone levels increase in a community. These excess hospital admissions and emergency room visits are observed when hourly ozone concentrations are as low as 0.08 to 0.10 ppm.

Numerous recent studies have found positive associations between increases in ozone levels and excess risk of mortality. These associations persist even when other variables including season and levels of particulate matter are accounted for. This indicates that ozone mortality effects are independent of other pollutants (Bell et al. 2004). Several population-based studies suggest that asthmatics are more adversely affected by ambient ozone levels, as evidenced by increased hospitalizations and emergency room visits. Laboratory studies have attempted to compare the degree of lung function change seen in age and gender-matched healthy individuals versus asthmatics and those with chronic obstructive pulmonary disease. While the degree of change evidenced did not differ significantly, that finding may not accurately reflect the true impact of exposure on these respiration-compromised individuals. Since the respiration-compromised group may have lower lung function to begin with, the same degree of change may represent a substantially greater adverse effect overall.

A publication from the Children's Health Study focused on children and outdoor exercise. In communities with high ozone concentrations, the relative risk of developing asthma in children playing three or more sports was found to be over three times higher than in children playing no sports (McConnell et al. 2002). These findings indicate that new cases of asthma in children are associated with heavy exercise in communities with high levels of ozone. The susceptibility to ozone observed under ambient conditions could be due to the combination of pollutants that coexist in the atmosphere or ozone may actually sensitize these subgroups to the effects of other pollutants. A study of birth outcomes in southern California found an increased risk for birth defects in the aortic and pulmonary arteries associated with ozone exposure in the second month of pregnancy (Ritz et al. 2000). In summary, acute adverse effects associated with ozone exposures have been well documented, although the specific causal mechanism is still somewhat unclear. Additional research efforts are required to evaluate the long-term effects of air pollution and to determine the role of ozone in influencing chronic effects.

The evidence linking these effects to air pollutants is derived from population based observational and field studies (epidemiological) as well as controlled laboratory studies involving human subjects and animals. There have been an increasing number of studies focusing on the mechanisms (that is, on learning how specific organs, cell types, and biochemicals are involved in the human body's response to air pollution) and specific pollutants responsible for individual effects. Yet the underlying biological pathways for these effects are not always clearly understood. Although

individuals inhale pollutants as a mixture under ambient conditions, the regulatory framework and the control measures developed are mostly pollutant-specific. This is appropriate, in that different pollutants usually differ in their sources, their times and places of occurrence, the kinds of health effects they may cause, and their overall levels of health risk. Different pollutants, from the same or different sources, may sometimes act together to harm health more than they would acting separately. Nevertheless, as a practical matter, health scientists, as well as regulatory officials, usually must deal with one pollutant at a time in determining health effects and in adopting air quality standards. To meet the air quality standards, comprehensive plans are developed such as the SCAQMD's AQMP.

#### *Project Impact on Human Health from Ozone*

In its Friant Ranch decision, the California Supreme Court conceded that the explanation of the connection between an individual project's pollutant emissions in excess of thresholds and human health effects may not be possible given the current state of environmental science modeling. However, the California Supreme Court concluded that an EIR itself must explain, in a manner reasonably calculated to inform the public, the scope of what is and is not yet known about the effect of a project's significant and unavoidable air quality impacts on human health. The specific language provided by the Court is:

The EIR fails to provide an adequate discussion of health and safety problems that will be caused by the rise in various pollutants resulting from the Project's development. At this point, we cannot know whether the required additional analysis will disclose that the Project's effects on air quality are less than significant or unavoidable, or whether that analysis will require reassessment of proposed mitigation measures. Absent an analysis that reasonably informs the public how anticipated air quality effects will adversely affect human health, an EIR may still be sufficient if it adequately explains why it is not scientifically feasible at the time of drafting to provide such an analysis.

The following information is provided to be consistent with the Court's opinion by adequately explaining why it is not scientifically feasible at the time of drafting this analysis to provide an analysis explaining the connection between a project's regional pollutant emissions and human health. This information is based upon the San Joaquin Valley Air Pollution Control District (SJVAPCD) and SCAQMD amicus briefs filed in the Friant Ranch decision that explain the difficulties in providing a correlation between regional pollutant emissions and human health. The findings and conclusions from the SJVAPCD and SCAQMD are considered applicable and germane to the issue. The complete amicus briefs are included as Appendix D.

With regard to the analysis of air quality-related health impacts, the SCAQMD, the air quality authority for the SCAB, has stated that "EIRs must generally quantify a project's pollutant emissions, but in some cases, it is not feasible to correlate these emissions to specific, quantifiable health impacts (e.g., premature mortality; hospital admissions)." In such cases, a general description of the adverse health impacts resulting from the pollutants at issue may be sufficient.

The SCAQMD has further stated that from a scientific standpoint, it takes a large amount of additional precursor emissions to cause a modeled increase in ambient ozone levels over an entire region. For example, the SCAQMD's 2012 AQMP showed that reducing NO<sub>x</sub> by 432 tons per day and reducing ROG by 187 tons per day would only reduce ozone levels at the SCAQMD's monitor site with the highest levels by only 9 parts per billion (SCAQMD 2013). SCAQMD staff does not currently

know of a way to accurately quantify ozone- related health impacts caused by NO<sub>x</sub> or ROG precursor emissions from relatively small projects.

SCAQMD acknowledged that it may be feasible to analyze air quality related health impacts for projects on a regional scale with very high emissions of NO<sub>x</sub> and ROGs, where impacts are regional. The example SCAQMD provided was for proposed Rule 1315, which authorized various newly-permitted sources to use offsets from the “internal bank” of emission reductions. The CEQA analysis accounted for essentially all of the increases in emissions due to new or modified sources in the District between 2010 and 2030, or approximately 6,620 pounds per day of NO<sub>x</sub> and 89,947 pounds per day of ROG, to expected health outcomes from ozone and particulate matter (e.g., 20 premature deaths per year and 89,947 school absences in the year 2030 due to ozone).

The SCAQMD stated, its staff does not currently know of a way to accurately quantify ozone- related health impacts caused by ozone from relatively small projects, then a general description of the adverse health impacts resulting from the pollutants at issue, described within this report, is all that can be provided at this time. Please see the above description of general adverse health impacts resulting from ozone.

The SJVAPCD amicus brief addresses whether it is scientifically feasible to correlate an individual project’s air quality emissions to specific health impacts. Human health impacts associated with criteria pollutants are analyzed and taken into consideration when the USEPA sets the NAAQS for each criteria pollutant (42 U.S.C. Section 7409(b)(1)). The health impact of a particular criteria pollutant is analyzed on a regional, not a facility level, based on how close the area is to complying with (attaining) the NAAQS. As discussed by the SJVAPCD, it is not feasible to conduct a criteria air pollutant analysis detailing health impacts, as currently available computer modeling tools are not equipped for this task.

In requiring a health risk type analysis for criteria air pollutants, it is important to understand how the relevant criteria pollutants (ozone and particulate matter) are formed, dispersed and regulated. Ground level ozone (smog) is not directly emitted into the air but is instead formed when precursor pollutants such as NO<sub>x</sub> and ROG are emitted into the atmosphere and undergo complex chemical reactions in the process of sunlight. Once formed, ozone can be transported long distances by wind. Because of the complexity of ozone formation, a specific tonnage amount of NO<sub>x</sub> or ROGs emitted in a particular area does not equate to a particular concentration of ozone in that area. Even rural areas that have relatively low tonnages of emissions of NO<sub>x</sub> or ROG can have high levels of ozone concentrations simply due to wind transport. Conversely, areas that have substantially more NO<sub>x</sub> and ROG emissions could experience lower concentrations of ozone simply because sea breezes disperse the emissions (SJVAPCD 2007).

The disconnect between the tonnage of precursor pollutants and the concentration of ozone formed is important because it is not necessarily the tonnage of precursor pollutants that causes human health effects; rather, it is the concentration of resulting ozone that causes these effects. The NAAQS, which are statutorily required to be set by USEPA at levels that are requisite to protect the public health, are established as concentrations of ozone and not as tonnages of their precursor pollutants. Because the NAAQS are focused on achieving a particular concentration region-wide, the SJVAPCD’s tools and plans for attaining the NAAQS are regional in nature.

The computer models used to simulate and predict an attainment date for ozone are based on regional inventories of precursor pollutants and meteorology within the air basin. At a very basic level, the models simulate future ozone levels based on predicted changes in precursor emissions basin wide. The computer models are not designed to determine whether the emissions generated

by an individual development project will affect the date that the air basin attains the NAAQS. Instead, the models help inform regional planning strategies based on the extent all of the emission-generating sources within the air basin must be controlled in order to reach attainment.

In the case of the Campus Master Plan, operational emissions exceed the SCAQMD operational significance thresholds for NO<sub>x</sub> and ROG. However, this does not mean that one can feasibly determine the concentration of ozone that would be created at or near a project site on a particular day or month of the year, or the specific human health impacts that may occur. Meteorology, the presence of sunlight, and other complex chemical factors all combine to determine the ultimate concentrations and locations of ozone. This is especially true for the Campus Mater Plan, where most of the criteria pollutant emissions derive not from a single “point source,” but from mobile sources (cars and trucks) driving to, from, and around the campus, or from consumer product and architectural coating use that can occur in many individual areas of the campus.

In addition, it would be infeasible to model the impact on NAAQS attainment that these emissions from the Campus Master Plan may have. As discussed above, the currently available tools are equipped to model the impact of all emission sources in the air basin on attainment. According to the SCAQMD’s 2016 AQMP, basin wide emissions in 2012 of ROG was 162.4 tons per day and 293.1 tons per day of NO<sub>x</sub> emissions (SCAQMD 2017). Running the photochemical grid model used for predicting ozone attainment with the emissions solely from a project (which equates to less than one tenth of one percent for both ROG and NO<sub>x</sub>) is not likely to yield valid information given the relatively small scale involved.

Consistent with the California Supreme Court’s Friant Ranch decision, the above information provides additional details regarding the potential health effects from the project’s significant and unavoidable criteria pollutant emissions. It also adequately explains why it is not scientifically feasible at the time of drafting of this report to substantively connect this individual project’s air quality impacts to likely health consequences so that the public may make informed decisions regarding the costs and benefits of the Campus Master Plan.

### *Construction*

Table 4.2-5 summarizes the estimated maximum daily emissions (lbs) of pollutants associated with buildout of the Campus Master Plan.

Table 4.2-5 Project Construction Emissions

	Maximum Emissions (lbs/day)					
	ROG	NO <sub>x</sub>	CO	SO <sub>2</sub>	PM <sub>10</sub>	PM <sub>2.5</sub>
<b>Phase 1 (2024 to 2029)</b>						
Construction Year 2024	1	4	24	<1	8	5
Construction Year 2025	2	29	46	<1	9	5
Construction Year 2026	9	33	73	<1	30	8
Construction Year 2027	8	32	70	<1	30	8
Construction Year 2028	8	32	67	<1	30	8
Construction Year 2029	58	31	65	<1	30	8
<b>Phase 2 (2030 to 2034)</b>						
Construction Year 2030	2	46	58	<1	12	5
Construction Year 2031	2	45	58	<1	19	6
Construction Year 2032	2	17	31	<1	9	2
Construction Year 2033	2	16	30	<1	9	2
Construction Year 2034	30	16	30	<1	9	2
<b>Phase 3 (2035 to 2039)</b>						
Construction Year 2035	2	33	52	<1	10	5
Construction Year 2036	2	33	52	<1	16	5
Construction Year 2037	2	16	29	<1	9	2
Construction Year 2038	2	16	29	<1	9	2
Construction Year 2039	29	16	29	<1	9	2
Maximum Emissions	58	46	73	<1	30	8
SCAQMD Regional Thresholds	75	100	550	150	150	55
<b>Threshold Exceeded?</b>	<b>No</b>	<b>No</b>	<b>No</b>	<b>No</b>	<b>No</b>	<b>No</b>
Maximum On-site Emissions	N/A	3	33	N/A	8	5
SCAQMD Localized Significance Thresholds (LSTs)	N/A	221	1,311	N/A	11	6
<b>Threshold Exceeded?</b>	<b>N/A</b>	<b>No</b>	<b>No</b>	<b>N/A</b>	<b>No</b>	<b>No</b>

Notes: See Appendix C for modeling results. Some numbers may not add up precisely due to rounding considerations. Maximum on-site emissions are the highest emissions that would occur on the project site from on-site sources, such as heavy construction equipment and architectural coatings, and excludes off-site emissions from sources such as construction worker vehicle trips and haul truck trips.

As shown in Table 4.2-5, ROG, NO<sub>x</sub>, CO, SO<sub>2</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub> emissions would not exceed SCAQMD regional thresholds or LSTs. The year with the maximum daily emissions for CO, SO<sub>2</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub> is under Phase 1 in 2026; the maximum daily emissions for ROG is under Phase 1 in 2029; and the year with the maximum daily emissions for NO<sub>x</sub> is under Phase 2 in 2030. Phase 1 and Phase 2 have a construction intensity of approximately 367,000 sf and 300,000 sf per year, respectively. Therefore, it can be stated that if the Campus Master Plan’s simultaneous construction does not exceed 300,000 gross square feet per year, the Campus Master Plan would not exceed SCAQMD thresholds. Construction activities associated with the Campus Master Plan would not result in a cumulatively considerable net increase of a criteria pollutant, and impacts would be less than significant.

*Operational*

Table 4.2-6 summarizes the operational emissions by emission source (area, energy, and mobile) from the Campus Master Plan. As shown below, the emissions generated by operation of the proposed project would not exceed SCAQMD regional thresholds for criteria pollutants for CO, SO<sub>2</sub>, PM<sub>10</sub>, and PM<sub>2.5</sub>. However, operational emissions would exceed the SCAQMD regional thresholds for ROG and NO<sub>x</sub>. The majority of ROG emissions are associated with area emissions from consumer product use. The majority of NO<sub>x</sub> emissions are from vehicle trips associated with the project. Therefore, the project would contribute substantially to an existing or projected air quality violation and would result in a cumulatively considerable net increase of criteria pollutants. Impacts would be potentially significant.

**Table 4.2-6 Project Operational Emissions**

Emission Source	Maximum Daily Emissions (lbs/day)					
	ROG	NO <sub>x</sub>	CO	SO <sub>2</sub>	PM <sub>10</sub>	PM <sub>2.5</sub>
Area	82	3	227	<1	1	1
Energy	2	16	11	<1	1	1
Mobile	9	41	112	1	72	20
<b>Project Emissions</b>	<b>93</b>	<b>60</b>	<b>350</b>	<b>1</b>	<b>74</b>	<b>22</b>
SCAQMD Regional Thresholds	55	55	550	150	150	55
<b>Threshold Exceeded?</b>	<b>Yes</b>	<b>Yes</b>	<b>No</b>	<b>No</b>	<b>No</b>	<b>No</b>

Notes: See Appendix C for modeling results. Some numbers may not add up precisely due to rounding considerations.

**Mitigation Measures**

*Reactive Organic Gases (ROG)*

The largest contribution to exceeding the SCAQMD thresholds for ROG emissions from project operation is from consumer product use. The following mitigation measure would be implemented to reduce this impact:

### **AQ-1 GREEN CLEANING PRODUCTION EDUCATION PROGRAM**

CSUF shall develop a Green Cleaning Product education program to be made available at housing offices, educational areas, and/or on websites. The education program is intended for students and institutional consumers and consists of:

- (1) Provision of educational materials in housing offices, educational areas, and/or on websites, about low ROG/VOC consumer products for planned housing and academic uses,
- (2) Educational materials addressing the use of detergents; cleaning compounds; polishes; floor finishes; cosmetics; personal care products; home, lawn and garden products; disinfectants; sanitizers; aerosol paints; automotive specialty products; low ROG/VOC paints and architectural coatings; and low emission landscape equipment.
- (3) Educational materials on the importance of recycling and purchasing recycled material.

#### *Nitrous Oxides (NO<sub>x</sub>)*

The Campus Master Plan includes a TDM Plan, that would include measures to reduce vehicle trips. This would have the effect of reducing operational NO<sub>x</sub> emissions. As NO<sub>x</sub> emissions would exceed the SCAQMD threshold of 55 lbs/day by 5 lbs/day, a reasonable reduction in mobile trips through the TDM Plan would likely have the effect of reducing emissions below thresholds. However, at this stage of planning, specifics on the TDM Plan that would be quantifiable in the modeling were not available. In addition, the operational air quality analysis assumes a worst-case scenario in estimating vehicular emissions associated with the Campus Master Plan as it assumes that all project vehicular trips are new trips to the region that would result in new additional mobile emissions. However, it is important to note that it is highly unlikely that those vehicular trips would be entirely additive to the traffic in the region. Many of the students and faculty that are a part of the campus growth live in the SCAQMD and undertake vehicle trips that already contribute to the NO<sub>x</sub> emissions of the area. In addition, the construction of new student and faculty housing on campus would allow for more students and faculty to live on campus instead of commuting, and the Campus Master Plan for some persons would thereby have a positive effect on reducing their vehicle miles traveled (VMT) and therefore a reduction in their NO<sub>x</sub> emissions.

The campus is well served by public transportation systems, including buses, providing alternative transportation options for students, employees, and visitors going to and from the campus. As discussed in Section 4.11, *Transportation*, the existing CSUF campus produces a lower VMT per service population (18.72 VMT) than the City of Fullerton (22.24 VMT). This is likely due to the reduction in trip and trip lengths associated with students and faculty who live on campus and the CSUF community's use of available transit services used to access the campus. However, we cannot currently assume that additional transit use associated with the project would significantly reduce operational NO<sub>x</sub> emissions. Therefore, at this stage of planning, mitigation measures are not available that would feasibly reduce impacts from operational NO<sub>x</sub> emissions to a less than significant level.

### **Significance After Mitigation**

Implementation of Mitigation Measure AQ-1 would provide educational information to students and staff of the campus to decrease their use of consumer products to benefit the air quality of the basin. The amount of reductions created by the educational material is not quantifiable at this stage of planning, as the reductions would ultimately depend on future individual consumer behavior.

Therefore, it is conservatively assumed that the project would still result in operational ROG emissions that exceed SCAQMD regional thresholds. In addition, as described above, at this stage of planning, project design features and mitigation are not available that would feasibly reduce impacts from operational NO<sub>x</sub> mobile emissions to a less than significant level. Therefore, impacts from operational emissions would be significant and unavoidable.

<b>Threshold 3:</b> Would the project expose sensitive receptors to substantial pollutant concentrations?
---

**Impact AQ-1** THE PROJECT WOULD NOT EXPOSE SENSITIVE RECEPTORS TO SUBSTANTIAL POLLUTANT CONCENTRATIONS FROM CO HOTSPOTS OR TACs. IN ADDITION, THE PROJECT WOULD NOT SITE NEW SENSITIVE LAND USES NEAR SUBSTANTIAL POLLUTANT GENERATING LAND USES. IMPACTS WOULD BE LESS THAN SIGNIFICANT. NO MITIGATION MEASURES ARE REQUIRED.

---

### Carbon Monoxide Hotspots

A CO hotspot is a localized concentration of CO that is above a CO ambient air quality standard. Localized CO hotspots can occur at intersections with heavy peak hour traffic. Specifically, hotspots can be created at intersections where traffic levels are sufficiently high such that the local CO concentration exceeds the federal one-hour standard of 35.0 ppm or the federal and State eight-hour standard of 9.0 ppm (CARB 2016a).

A detailed CO analysis was conducted during the preparation of SCAQMD's 2003 AQMP. The locations selected for microscale modeling in the 2003 AQMP included high average daily traffic (ADT) intersections in the SCAB, those which would be expected to experience the highest CO concentrations. The highest CO concentration observed was at the intersection of Wilshire Boulevard and Veteran Avenue on the west side of Los Angeles near Interstate 405 (I-405). The concentration of CO at this intersection was 4.6 ppm, which is well below the state and federal standards. The Wilshire Boulevard/Veteran Avenue intersection has an ADT of approximately 100,000 vehicles per day.

The highest ADT for nearby roadways to the proposed project would occur on Yorba Linda Boulevard, which under the existing plus project scenario would generate 41,890 ADT (Fehr & Peers 2019), which is less than the 100,000-vehicle count on the Wilshire Boulevard/Veteran Avenue intersection that was already well below the standards. Furthermore, due to stricter vehicle emissions standards in newer cars and new technology that increases fuel economy, CO emission factors under future land use conditions would be lower than those under existing conditions. Thus, even though there would be more vehicle trips under the proposed project than under existing conditions, project-generated local mobile-source CO emissions would not result in or substantially contribute to concentrations that exceed the one-hour or eight-hour CO standard. Therefore, impacts would be less than significant.

### Toxic Air Contaminants

Construction-related activities would result in short-term, project-generated emissions of DPM exhaust emissions from off-road, heavy-duty diesel equipment for site preparation (e.g., excavation, grading, and clearing), building construction, and other miscellaneous activities. DPM was identified as a TAC by CARB in 1998. The potential cancer risk from the inhalation of DPM, as discussed below, outweighs the potential non-cancer health impacts (CARB 2017b).

Generation of DPM from construction typically occurs in a single area for a short period. Construction of the Campus Master Plan projects would occur over nearly two decades but use of diesel-powered construction equipment in any one area would likely occur for no more than a few years and would cease when construction is completed in that area. The dose to which the receptors are exposed is the primary factor used to determine health risk. Dose is a function of the concentration of a substance or substances in the environment and the extent of exposure that person has with the substance. Dose is positively correlated with time, meaning that a longer exposure period would result in a higher exposure level for the Maximally Exposed Individual. The risks estimated for a Maximally Exposed Individual are higher if a fixed exposure occurs over a longer period of time. According to the Office of Environmental Health Hazard Assessment (OEHHA), health risk assessments, which determine the exposure of sensitive receptors to toxic emissions, should be based on a 70-year exposure period; however, such assessments should be limited to the period/duration of activities associated with the project.

Sensitive receptors to DPM would be considered the segments of the population most susceptible to poor air quality (children, the elderly, or those with pre-existing serious health problems; CARB 2005). This includes land uses where sensitive receptors such as children are more likely to spend time outside, such as a daycare. Most of the campus would be occupied by students or faculty who would not be considered the most susceptible to DPM. The campus does have an on-site daycare facility, the Children's Center, which is located in the northwestern portion of the project site. Sensitive receptors at the daycare are considered the Maximally Exposed Individual for this analysis. The closest construction to the Children's Center would occur approximately 150 feet to the north across Children's Way for one of the Campus Master Plan's proposed parking garages. Sensitive receptors such as children or the elderly may also live in the residences located in the area, and children would be present at the La Vista and La Sierra High School east of the campus. However, these sensitive receptors would be located at a further distance than the Children's Center; therefore, analyzing DPM risks at the Children's Center would represent the most conservative scenario.

To conduct a screening-level analysis for cancer and non-cancer health impacts to the nearest sensitive receptors to project construction, the  $PM_{2.5}$  and  $PM_{10}$  emissions for the phase with the highest emissions (Phase 1) were summed from the CalEEMod outputs (the inputs of which are discussed in further detail under Section 4.2.2). These emissions were then inputted into AERSCREEN, USEPA's screening model for air quality dispersion. The annual concentration from AERSCREEN was then input into cancer risk and non-cancer risk formulas based upon the OEHHA's Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments (OEHHA 2015).

Under the analyzed scenario, the project would result in a cancer risk of 3.6 in 10 million at the closest sensitive receptor, the Children's Center. The project's Hazard Index would be 0.2 at the Children's Center. Given the aforementioned, DPM generated by project construction is not expected to create conditions where the Maximum Incremental Cancer Risk probability is greater than 10 in 1 million for the Maximally Exposed Individual or to generate ground-level concentrations of noncarcinogenic TACs that exceed a Hazard Index greater than 1 for the Maximally Exposed Individual. This impact would be less than significant.

## Project Siting

CARB documentation from 2005 gave a recommendation to avoid siting new residences within 500 feet of a freeway, urban roads with 100,000 vehicles/day, or rural roads with

50,000 vehicles/day (CARB 2005). The project could place sensitive receptors living in housing within approximately 300 feet of the centerline of SR 57. In 2017, SR 57 had traffic volumes of up to 278,400 ADT on the freeway segments next to campus (Caltrans 2019). According to the project TIS, adjacent roadways with project traffic in either the existing or future (2040) scenarios would have traffic volumes as high as 41,890 (on Yorba Linda Boulevard), which would not exceed the recommended limit of 100,000 vehicles/day for urban roads.

CARB released a technical advisory in 2017 on reducing air pollution near high-volume roadways to clarify the 500-foot recommendation from 2005 due to the increased focus on and benefits from infill development, which can often occur within 500 feet of a major roadway (CARB 2017a). As described in the technical advisory, California has implemented various measures to improve air quality and reduce exposure to traffic emissions. These include the Diesel Risk Reduction Plan, which aims to reduce particulate matter emissions from diesel vehicles. The continued electrification of California's vehicle fleet would also reduce PM<sub>2.5</sub> levels, and ongoing efforts to reduce emissions from cars and trucks and to move vehicles towards "zero emission" alternatives will continue to drive down traffic pollution (CARB 2017a).

As shown in Table 4.2-2, the nearest monitoring stations to the project have shown the area to have relatively clean air, as over the past three years of monitoring data the worst year there was only 11 violations (in 2017). In addition, the project would implement the residential indoor air quality requirements in the 2019 Title 24 Building Energy Efficiency Standards which require Minimum Efficiency Reporting Value (MERV) 13 (or equivalent) filters for heating/cooling systems and ventilation systems in residences (Section 150.0[m]), or would implement future standards that would be anticipated to be more stringent than 2019 standards. Given the aforementioned, the siting of the residences near SR 57 would not be anticipated to expose sensitive receptors to substantial pollutant concentrations, and impacts would be less than significant.

## Mitigation Measures

Mitigation measures are not required.

## Significance After Mitigation

Impacts would be less than significant without mitigation.

<b>Threshold 4:</b> Would the project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?
--

**Impact AQ-2** IMPLEMENTATION OF THE PROJECT WOULD NOT CREATE OBJECTIONABLE ODORS THAT COULD AFFECT A SUBSTANTIAL NUMBER OF PEOPLE. IMPACTS WOULD BE LESS THAN SIGNIFICANT. NO MITIGATION MEASURES ARE REQUIRED.

For construction activities, odors would be short-term in nature and are subject to SCAQMD Rule 402 *Nuisance* (SCAQMD 1976). Construction activities would be temporary and transitory and associated odors would cease upon construction completion. Accordingly, the proposed project would not create objectionable odors affecting a substantial number of people during construction, and short-term impacts would be less than significant.

Common sources of operational odor complaints include sewage treatment plants, landfills, recycling facilities, and agricultural uses. The proposed project would not include any of these uses. In addition, solid waste generated by the proposed on-site uses would be collected by a contracted

waste hauler, ensuring that any odors resulting from on-site waste would be managed and collected in a manner to prevent the proliferation of odors. Operational odor impacts would be less than significant.

### **Mitigation Measures**

Mitigation measures are not required.

### **Significance After Mitigation**

Impacts would be less than significant without mitigation.

*This page intentionally left blank.*

## 4.3 Cultural and Historical Resources

---

This section provides an overview of the cultural/tribal cultural and historical resources in the project vicinity and, in accordance with CEQA, evaluates direct and indirect impacts associated with development of the proposed project. This section includes the following: (1) identification and evaluation of the significance of any cultural resources falling within the project area and area of potential impacts; (2) determination if implementation of the proposed project would have any adverse impacts on those resources; and (3) identification of mitigation measures for any significant impacts (pursuant to CEQA Guidelines Section 15126.2) on cultural/tribal and historical resources.

The analysis in this section is based in part on the Archaeological Resources Technical Report and the Historic Resources Survey Report (HRSR), prepared for this project by Rincon Consultants, Inc. (Rincon). Both reports are included in Appendix E and Appendix F of this document, respectively.

Project impacts on tribal cultural resources are based, in part, on the results of consultation completed with local California Native Americans, conducted pursuant to Assembly Bill (AB) 52. Consultation records are included in Appendix G of this document.

### 4.3.1 Environmental Setting

#### a. Cultural Setting

##### Prehistory

The project site lies in what generally is described as California's Southern Bight (Byrd and Raab 2007). This region extends from the Mexican border to Santa Monica and includes Orange and San Diego counties, western Riverside County, and the Southern Channel Islands. The prehistoric cultural chronology for the Southern Bight is presented in the Archaeological Resources Technical Report (Appendix E) following Byrd and Raab (2007), who have divided the chronology into the Early [9600- 5600 Before the Common Era (BCE)], Middle (5600-1650 BCE), and Late (1650 BCE- 1769 CE) Holocene.

##### Ethnography and Tribal Resource Setting

The project site is located within the traditional territory of the Native American group known as the Gabrieliño. The name Gabrieliño was applied by the Spanish to those natives that were attached to Mission San Gabriel (Bean and Smith 1978:538). Today, most contemporary Gabrieliño prefer to identify themselves as Tongva, a term that was used in the Archaeological Resources Technical Report (Appendix E) and will be used throughout the remainder of this section.

Tongva territory included the Los Angeles basin and southern Channel Islands, as well as the coast from Aliso Creek in the south to Topanga Creek in the north. Their territory encompassed several biotic zones, including Coastal Marsh, Coastal Strand, Prairie, Chaparral, Oak Woodland, and Pine Forest (Bean and Smith 1978).

Prior to European contact, deceased Tongva were either buried or cremated, with burial more common on the Channel Islands and the adjacent mainland coast and cremation on the remainder of the coast and in the interior (McCawley 1996:157). After pressure from Spanish missionaries, cremation essentially ceased during the post-contact period (McCawley 1996:157).

Review of previously recorded resources and results of a pedestrian field survey by an archaeologist did not reveal findings of significant tribal cultural resources present on the project site (Appendix E). There are no known tribal cultural resources present on the project site; notification of Native American tribes of the Gabrieleño/Tongva Nation in the vicinity of the project site is required for this project under Assembly Bill 52 (AB 52).

## **b. Historic Setting**

The post-Contact history of California is generally divided into three periods: the Spanish period (1769–1822), the Mexican period (1822–1848), and the American period (1848–present). These historical periods are described in the Archaeological Resources Technical Report (Appendix E).

The remainder of this section provides the historic setting and context information for CSUF, divided chronologically and according to significant themes. This contextual information was compiled for a historic resources survey of the CSUF campus; the survey included permanent, built environment properties 45 years of age and older (the full Historic Evaluation Survey Report, along with all figures, historic aerial photographs, site plans and maps, follows in Appendix F). Therefore, the focus of this historic setting section is the eras and themes represented in the extant environment of CSUF—namely, pre-CSUF during the City of Fullerton’s citrus age, and the postwar boom and institutional expansion of Fullerton and Orange County, given the campus’s 1957 establishment and subsequent expansion in the 1960s and 1970s (and beyond). This section also considers the larger themes that affected the region, such as the institutional development of the CSU system.

### **Fullerton’s Founding Years and the Citrus Age**

The City of Fullerton is located in the northern region of Orange County in Southern California. The land that currently encompasses Fullerton was part of the Spanish Mission San Gabriel Arcángel in the 18<sup>th</sup> century. With the liberation of Mexico from Spain in 1821 and the dissolution of the missions in 1833, Mexico established agency over the newly secularized land in Alta California. One way in which the new country rewarded loyalty and began to populate these northern stretches was with land grants. In 1837, the Mexican government bestowed one such grant of 35,970 acres of land on soldier Juan Pacifico Ontiveros. This area encompasses much of present-day Anaheim, Placentia, and Fullerton. By the mid-19<sup>th</sup> century, Ontiveros sold much of the land, which was parceled out to new Anglo settlers moving westward (Brunet 1990). Numerous settlers purchased land in the area, although most development was scattered until the 1880s.

Prior to the establishment of Fullerton proper, a number of families made the trek to the area to establish farms. The town only started to emerge, however, following the arrival of brothers George and Edward Amerige, grain merchants from Boston. In 1886, the Amerige brothers visited the region for a quail hunting excursion when they learned that the Santa Fe Railway was planning its expansion into the area. The enterprising pair purchased over 400 acres of land with the intent of establishing a town near the railroad.

In 1887, the Amerige brothers negotiated with George H. Fuller, president of the Pacific Land and Improvement Company, to include the townsite in the railway’s survey in exchange for free right-of-way and half interest in the land. The town of Fullerton was officially founded on July 5, 1887, when Edward Amerige plotted the town in the middle of a mustard field, naming the new town after George H. Fuller (Maag 1939). In 1904, Fullerton was incorporated as a city. It was recorded as occupying 18 miles with a population of 3,000 people.

Agricultural development in the area occurred during two main development eras: a brief but noteworthy experiment in a vegetarian colony (known as the “Placentia District”) on and near the present site of CSUF, and the subsequent, better known era of citrus cultivation. The first development occurred in the 1870s with the establishment of Thales Ranch, or the Placentia Colony, on ten acres that would later be purchased for CSUF. The second wave of agricultural development occurred in the 1880s with the introduction of citrus plants to the area. Many of these orchard fields were also purchased for the development of CSUF. History specific to the Placentia District and citrus cultivation in Fullerton is included in the HRSR (Appendix F).

Citrus production continued to be an important industry in Fullerton into the 1930s, following a general decline during the Great Depression. During World War II, many defense-related industries arrived in the county (and the region). Following the war, the agricultural character of Fullerton and Orange County slowly began to shift, with acres of groves giving way to new residential tracts and accompanying amenities. The citrus groves on the site of present-day CSUF were cleared in the 1960s and 1970s.

### **Postwar Boom in Orange County and Fullerton**

World War II ushered in a new era of expansion in California. Orange County was no exception in this respect, as acres of citrus groves gave way to new housing tracts, which accommodated a rapid influx of new residents (Caltrans 2011). In the postwar period, the educational and institutional expansion mirrored and was driven by this rapid population growth, in Orange County and throughout California.

In 1944, U.S. President Franklin D. Roosevelt established the Servicemen’s Readjustment Act, commonly known as the G.I. Bill of Rights. As a result, thousands of veterans enrolled in higher education programs in California. Four hundred universities and colleges in California were approved for the program, with over 50 percent of veterans attending 50 of the approved schools. Between 1946 and 1947, over 850 veterans attended Fullerton College alone (Fullerton College Library 2012). This influx also affected the California State College System, and additional campuses were established in Sacramento (1947) and Long Beach (1949).

Despite this rapid expansion, the need for colleges in California continued unabated into the 1950s. Within four years, seven additional California State College campuses were established in the State: Fullerton (1957), Hayward (1957), Stanislaus (1957), San Fernando Valley (1958), Sonoma (1960), San Bernardino (1960), and Dominguez Hills (1960). In 1960, the Donahoe Higher Education Act united the individual California State Colleges. By 1972, the California State University and Colleges system was created, and schools changed their names to include “California State University,” commonly followed by their location. A decade later, the system was formalized into the California State University program that is still in place across the state (CSU 2019).

### **Historic Development of the Project Area: The Founding of CSUF**

Well into the postwar period, Orange County was still home to numerous acres of the citrus groves that had given the County its name. At the same time, Southern California’s population continued to grow exponentially, and the agricultural character of Orange County and Fullerton began to shift and give way to development and residential settlement.

Originally known as Orange County State College, the university was founded in 1957 on a site still home to a number of citrus farms and agricultural fields. Because the acquisition of the proposed 252-acre campus was costly, the land was purchased in three phases. In November 1958, legislature

approved purchase of the first 160 acres of land for the school (Napa Valley Register 1958). An additional 77 acres were approved the following year in July 1959 (Los Angeles Times 1959). A final land acquisition of approximately 15 acres was completed in 1960 (Los Angeles Times 1960b).

With the campus' land purchased, the school anticipated an immediate demand for classes and sought to establish temporary quarters for students and teachers while permanent buildings were under construction. From 1959 until 1961, classes were held in rented quarters at the Sunny Hills High School. In 1960, a series of temporary, one-story buildings were added along the western portion of the campus; the buildings were constructed by Allison Honor Company of Santa Ana (Los Angeles Times 1960a).

The campus core was designed and constructed primarily through four major building campaigns and master planning efforts, in 1960, 1962, 1967, and 1974. Although the campus continued to expand through the years, including a gradual northward expansion as former citrus groves gave way to buildings, the focal point of the campus remained (and remains) the 1960s-1970s campus core; there is not a larger historic district across the campus as a whole. This development pattern reflects the rapid postwar expansion and construction boom in Fullerton and Orange County in general. In addition, with the heart of the campus designed and constructed within a short period of time, during the heyday of New Formalism, Brutalism, and Late Modernism, in particular in institutional design, the campus core exhibits cohesive unified architectural character and style.

#### *Phase 1: 1960 Master Plan, 1960-1969*

Development of the campus began in the southern region of the CSUF site, accessible via Nutwood Avenue. Milton C. Blanchard and Dean Stuart F. McComb developed the college's building program, which by 1961 included an \$80 million master plan (Los Angeles Times 1961a, 1961b). The plan covered a 20-year period from 1960 to 1980 and sought to make the fledgling school one of the state's top educational institutions. Thirty-five baccalaureate and 24 postgraduate degrees were planned for a student body of 20,000 and a faculty of 1,000 full-time instructors.

The 1960 Master Plan called for the construction of six buildings: Letters and Sciences (1963), Music-Speech-Drama (1965), Physical Education and Gymnasium (1965), Library (1966), Cafeteria-Commons (1967), and Humanities and Social Sciences (1969). Created as part of the first major building campaign at CSUF, the buildings display a unified site plan, with each component arranged around a central quad and commons. Unified by axial circulation corridors and landscaping, the early campus core was completed between 1963 and 1969.

#### *Phase 2: 1962 Master Plan, 1969-1974*

By 1968, the college had reached over half of their expected enrollment, with 10,750 students enrolled for the fall semester. A year later, that number increased to 12,793 students occupying the "sprawling high-rise-style campus" (Los Angeles Times 1969b). At this point, CSUF was able to implement additional components of the 1960 into the 1962 Master Plan. Although an administration building and art building were identified in the 1960 Master Plan, their designs and locations were updated in the 1962 Master Plan. Buildings constructed during this second phase include the Visual Arts Building (1969), Engineering Building (1971), Administration Building (1971) and Health Center (1974).

As visible in a 1972 aerial, the unified, axial site plan of the campus was already intact by the early 1970s, with administrative and academic buildings located in the south of the campus and athletic fields in the northern extent of the campus. The 1972 aerial illustrates a cohesive site plan,

accompanying landscape design, and circulation corridors throughout campus. Much of the peripheral land to this central core was used for parking lots; athletic fields were completed in the northern portion of the campus.

The second phase of development mirrored and expanded the original historic core. Overall, buildings completed in the early 1970s were organized around the existing core and shared the aesthetic principals and design characteristics of the first six buildings.

### *Politics and Social Change*

Toward the conclusion of CSUF's first decade, the era of civil rights arrived on the campus. Throughout the 1960s and 1970s, American universities were often the site of student protests. According to English professor Cyril (Cy) Epstein, who wrote a book on the 1970 protest, CSUF was initially not among these campuses, as the school was "considered by most to be a more 'responsible' campus, if not exemplary... it was certainly located in the heart of Reagan territory" (Epstein 1971).

The initial impetus for the 1970 protest was a speech given by then-Governor Ronald Reagan at the campus in February. During the address, Reagan was heckled by students who, unbeknownst to them, were being recorded by the Fullerton Police Department. Within a week of the event, two of the protestors, Bruce Church and David MacKowiak, were arrested by the police. Alarmed by this, many students objected, asserting that the two students were being penalized for exercising their right to free speech. The two students were also accused of misconduct by CSUF, further raising tensions (De Graaf 1988). The student body's initial dissent was limited to protests in McCarthy Hall and the President's office (Mudrick, Rickey, Thomas 2015).

Political unrest exploded at CSUF in response to Nixon's declaration of the invasion of Cambodia and the Kent State shootings. Reacting to these events, Reagan shut down all University of California and state colleges for four days. In protest, students occupied the Performing Arts Building. According to historian and CSUF professor Larry de Graaf, "a conservative governor had unwittingly succeeded in transforming CSUF from the pursuits of learning into a center for antiwar activities in Orange County" (De Graaf 1988).

The repercussions of the protests were multifold: CSUF established itself as a location for political and social activism. By the end of spring semester 1970, as students returned home for the summer, the school slowly calmed from the wave of riots.

### *Phase 3: 1974 Master Plan, 1974-1975*

During the 1970s, one of the principal development projects was creation of an arboretum, as shown on the 1974 Master Plan. The timing of this Master Plan coincided with Fullerton's growth as a college city, partially because of CSUF. In 1973, the *Los Angeles Times* estimated that 40,000 students attended college in Fullerton; and school officials asserted that "the area surrounding Cal State is rapidly becoming one of the foremost educational centers in Southern California" (Moore 1973).

Prior to the development of the Arboretum in the 1970s, the northern expanse of CSUF was a largely unoccupied field scattered with citrus trees. After learning that the area was slated to become another parking lot, staff and students had the idea to transform the space into a botanical garden. This effort on the part of students was successful, and the arboretum was incorporated into the school's master plan.

### *Post-1975 Expansion*

CSUF's northeastern corner was dedicated to the arboretum and completed in 1979. This area is characterized by vegetation and winding paths that bisect the various gardens. By the 1980s and 1990s, as the campus expanded, new buildings were constructed primarily on the periphery of the central quad. Housing was constructed in the 1990s along the eastern border of the campus whereas permanent and portable academic buildings essentially "filled in" the periphery of the campus. Parking lots, and later parking structures in the 2000s, were also relegated to the edges of the campus. In subsequent years, the campus continued to expand and include areas south of Nutwood Street, west of North State College Boulevard, and north of Yorba Linda Boulevard.

## **CSUF Campus Architects and Design Professionals**

### *Risley, Gould & Van Heuklyn*

The firm of Risley, Gould & Van Heuklyn was responsible for the design of the Pollak Library at CSUF. Originally Risley & Gould, the firm was founded by Stanley Gould and Winchton Risley in 1948. Risley, Gould & Van Heuklyn was very active in Southern California and specialized in campus design for primary and secondary schools as well as colleges and universities. Perhaps the most notable comprehensive project that the firm completed was for the University of California, San Diego campus (Architectural Resources Group 2016).

### *William E. Blurock & Partners*

William E. Blurock & Partners, in partnership with Balch, Hutchason & Perkins, was responsible for the design of the Administration Building at CSUF (Los Angeles Times 1969a). The firm was established in 1960 in Newport Beach and was active until 1994.

Blurock specialized in educational institutions and was responsible for the planning and design of buildings on 32 California college campuses. Blurock also completed numerous Orange County civic projects, including the Orange County Performing Arts Center (now known as the Segerstrom Center for the Arts) and the City of Santa Ana Civic Center Mall.

### *Balch, Hutchason & Perkins*

Balch, Hutchason & Perkins, in partnership with William E. Blurock & Partners, was responsible for the design of the Administration Building at CSUF (Los Angeles Times 1969a). Balch, Hutchason & Perkins, consisting of William G. Balch, Willis K. Hutchason, and John L. Perkins, was a Los Angeles firm specializing in school architecture.

### *Thornton Abell*

Thornton Abell was responsible for the design of the Humanities and Social Sciences Building and the Visual Arts Complex at CSUF. Throughout his career, Abell was most widely recognized for his residential commissions (Gebhard and Winter 2003). Abell is known for his low, streamlined forms and use of simple, high-quality materials and received numerous awards for his designs over the years (HistoricPlacesLA N.d).

### *Marsh, Smith & Powell*

Although Marsh, Smith, & Powell did not complete work at CSUF, David D. Smith and Herbert James Powell, two of the architects associated with the firm, participated in the school's Master Plans.

Their early work at this firm, therefore, influenced the designs completed by Smith, Powell & Morgridge and Powell, Morgridge, Richards & Coghlan at CSUF.

Marsh, Smith & Powell was formed in 1928 by Norman F. Marsh, David D. Smith, and Herbert James Powell, and quickly became a key player in the evolution of school buildings from the 1920s through the 1950s. As school design evolved in the 1920s and 1930s, the firm helped define the textbook indoor-outdoor campus that came to characterize Southern Californian schools (Sapphos Environmental, Inc. 2014). The firm played a seminal role in Southern California's shift towards more "functional, child-centered, open-air schools" (Sapphos Environmental, Inc. 2014). Principal commissions included El Camino College (1950), the Life Science Building at UCLA (1952), and San Marino High School (1954) among numerous others (Sapphos Environmental, Inc. 2014). The firm also served as the University Architect at USC, where they hired USC graduates such as Thornton M. Abell to work on the campus.

#### *Smith, Powell & Morgridge*

The firm of Smith, Powell & Morgridge was responsible for the 1962 Master Plan at CSUF. The firm was formed in 1955 after the death of Marsh, as a successor firm to Marsh, Smith & Powell. That year, the remaining three partners at the firm rebranded the firm accordingly. The firm held this name from 1955 to 1966. Located out of Los Angeles, the firm of Smith, Powell & Morgridge was heavily active in Fullerton in the postwar years. In 1956, it designed the Fern Drive School in Fullerton, a postwar school that adopted residential forms and details and in 1962, it completed the New Formalist style Fullerton City Hall [Sapphos Environmental, Inc. 2014; Pacific Coast Architecture Database (PCAD) 2018]. During this period, Smith, Powell & Morgridge also expanded to complete municipal jobs, designing the Buena Park City Hall in 1958 and the Child Guidance Center in Pasadena in 1960 (AIA 1970).

#### *Powell, Morgridge, Richards & Coghlan*

Powell, Morgridge, Richards & Coghlan designed the 1967 and 1974 Master Plans of CSUF. The firm was formed in 1966 as a successor firm to Smith, Powell & Morgridge by Herbert James Powell, Henry Morgridge, Albert Anton Richards, and Rapier R. Coghlan. That year they designed the library at Chapman College in Orange (Chapman University 1965).

#### *George T. Nowak*

George T. Nowak designed Titan Hall in 1974 while it was associated with the Western State University College of Law. Besides designing several movie theaters in Los Angeles County, no additional information regarding Nowak's work was available (Los Angeles Times 1968, 1970).

## **Landscape Architects**

#### *Cornell, Bridgers and Troller/Cornell, Bridgers, Troller and Hazlett/Bridgers, Troller and Hazlett*

Cornell, Bridgers and Troller were responsible for some of the early landscape designs of the CSUF center quad as well as the Engineering and Computer Science Building Complex. The latter iteration of the firm as Bridgers, Troller and Hazlett completed the landscape design for the Arboretum.

Following the firm's establishment in 1953, they built a prolific practice in landscape design throughout the Southern California region. Comprised of Ralph Cornell, Howard Troller, and Samuel

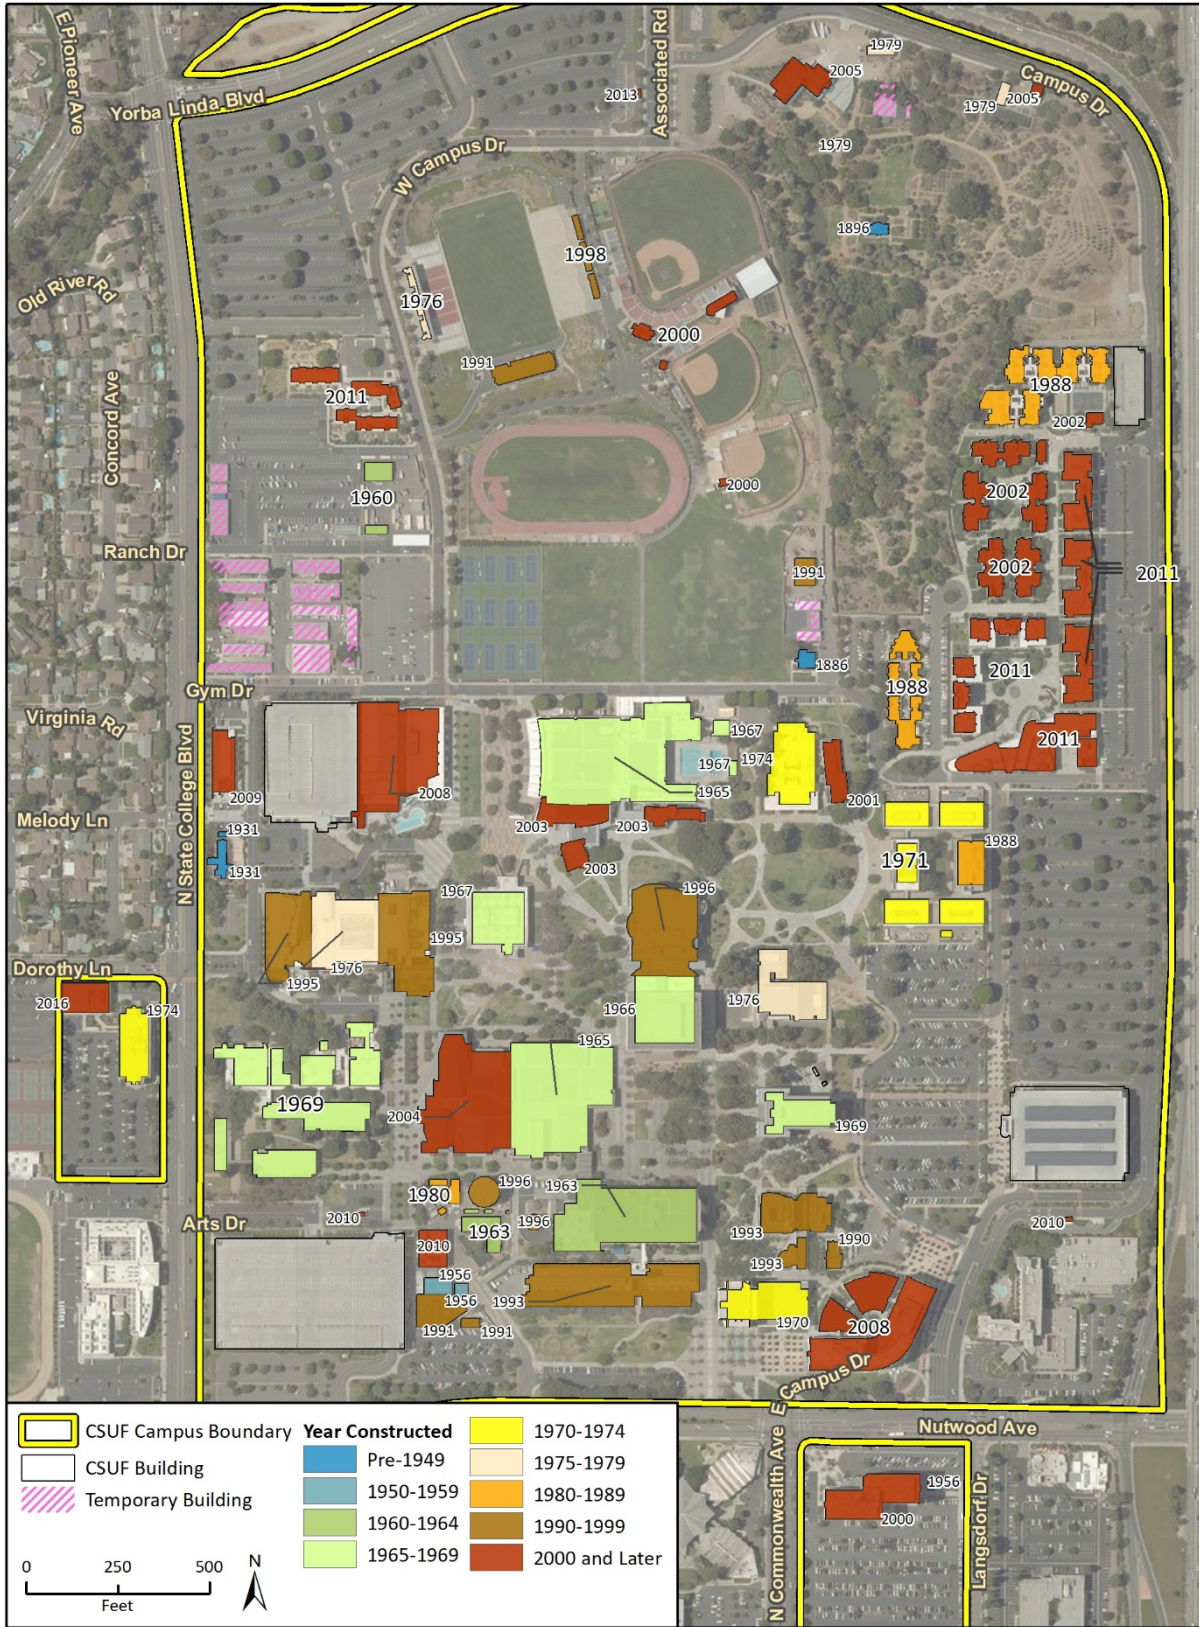

Bridgers, the firm was located in Los Angeles and completed numerous municipal projects in the city. Notable projects included the City Hall East Mall, the campus for the Department of Water and Power, the Music Center, and the Civic Center Mall (Grand Park). The firm also completed work outside of California including the landscapes of the Ford Motor Company's General Office Building in Dearborn, Michigan.

### **Myrton Purkiss**

Myrton Purkiss was responsible for landscaping surrounding the Heritage House in the Arboretum. Purkiss attended USC and the Chouinard Art Institute in Los Angeles where he studied ceramics. During World War II, Purkiss was drafted into military service where he worked as a cartographer. He returned to California in 1941 and settled in Fullerton. He transitioned careers in the mid-1950s, when he began his practice as a landscape architect (Everson Museum of Art 2018). He opened a firm, Purkiss-Rose Associates, and designed landscapes for public and private spaces (La Riviere 1977).

Figure 4.3-1 CSUF Campus Dates of Construction

## Cultural Resources within the Project Site

### *Previously Recorded Cultural Resources and Studies*

A cultural resource records search and literature review was conducted at the South Central Coastal Information Center (SCCIC) located at CSUF on June 18, 2019 (Appendix H). The search was completed to identify previous cultural resources work and previously recorded cultural resources within a 0.5-mile radius of the project site. The search included a review of the NRHP, CRHR, California Points of Historical Interest list, the California Historical Landmarks list, the Archaeological Determinations of Eligibility list, and the California State Historic Resources Inventory list. The records search also included a review of all available historical USGS 7.5-, 15-, and 30-minute quadrangle maps.

The SCCIC records search identified 24 previous studies within a 0.5-mile search radius of the project site. Of these, six included portions of the project site. Together, these previous studies inventoried approximately 40 percent the current project site. Table 4.3-1 provides a summary of the studies found in the search radius (Appendix H).

Source: Rincon 2019 (Appendix H)

The SCCIC records search identified 11 previously recorded cultural resources situated within a 0.5-mile radius of the project site. These resources consist of 10 historic-period buildings and one historic-period tree. Table 4.3-2 provides a summary of the previously recorded cultural resources within the record search area. No archaeological resources have been recorded within the project site or record search area.

**Table 4.3-2 Previously Recorded Cultural Resources within 0.5-mile of the CSUF Campus**

<sup>1</sup> National Register of Historic Places (NRHP)/California Register of Historic Resources (CRHR)  
 Source: Rincon 2019 (Appendix F)

Four buildings were previously recorded on the project site; additional information for each property is included in the HRSR (Appendix F) and summarized below.

**THE GEORGE G. GOLLEHER ALUMNI HOUSE (MAHR HOUSE)**

Extant in its original location, the 1931 Mahr House was originally owned by members of the Hetebrink family. The Spanish Eclectic style home was designed and built for Lottie Hetebrink by Clinton F. Abbott of Pacific Ready-Cut Homes. The home was ultimately sold to Andre and Opal Mahr in 1939. A native of Telluride, Colorado, Andrew Mahr and his family moved to Santa Ana and established a citrus farm. The family resided in the house until 1959, when it was purchased for the CSUF campus. The residence is located in its original location along the eastern boundary of the campus, just south of the intersection of Melody Lane and North State College Boulevard.

**THE TITAN HOUSE (HENRY T. HETEBRINK HOUSE)**

The Henry T. Hetebrink House (1886) was owned by members of the Hetebrink family and remains extant on the CSUF campus. Henry T. Hetebrink, his wife Rebecca, and their five children migrated from Hanover, Germany to the United States in 1859. Hetebrink served as a member of the school board (Guinn 1902). In 1874, the Hetebrink family settled in the Placentia District, an area that was later divided between Fullerton and Placentia. After a short-lived dairy farm venture, the family turned to cultivating citrus and walnut groves, staples that came to characterize the region. A fire in the early 1880s destroyed the original Hetebrink house, and Henry T. Hetebrink built the current brick Colonial Revival-style residence in 1886. The house was built using bricks that were produced locally in a kiln near present-day Fullerton College. Around this time, the Hetebrink family began to focus on citrus cultivation, planting hundreds of Valencia orange trees on much of their 160 acres of land.

Henry F. Hetebrink sold much of his land off piecemeal, with his last four acres sold in 1950. Eventually, much of the Hetebrink ranch would be sold to CSUF. The Hetebrink residence survives in its original location; it is a Colonial Revival-style brick house with a hipped roof. According to documents on file with the City of Fullerton Planning Department, the Hetebrink residence is the only remaining residential brick home from the City’s pioneering years, as well as one of the oldest in the County (City of Fullerton n.d.). In 2000, CSUF restored the house at a cost of \$500,000 (Harder 2001).

**THE HERITAGE HOUSE (DR. GEORGE C. CLARK HOME AND OFFICE)**

Constructed in 1896, the Dr. George C. Clark House and Office is an intact example of the Eastlake Victorian style architecture in Fullerton. The home was built for Dr. George C. Clark, Fullerton’s first physician. Clark was instrumental in the 1913 construction of the Fullerton General Hospital (City of

Fullerton N.d.). Originally located at 114 North Lemon Street in the original town site, the residence was moved to the CSUF Arboretum in 1972. The property is listed in the NRHP.

### **POLLAK LIBRARY**

The Pollak Library was designed by Risley, Gould & Van Heuklyn and constructed by J. B. Allen & Co. in 1963. With completion of the Library, the historic campus core, centered around the Library, McCarthy Hall, Claves Performing Arts Center, and Titan Gymnasium, was complete.

## **Cultural Resources Survey**

Rincon conducted a pedestrian field survey of the project site on July 15, 2019. The survey was performed using transect intervals spaced no greater than 15 meters, targeting areas of exposed ground surfaces on the CSUF campus. All exposed ground surfaces were examined for artifacts (e.g., flaked stone tools, tool-making debris, stone milling tools, ceramics, fire-affected rock), ecofacts (marine shell and bone), soil discoloration that might indicate the presence of a cultural midden, soil depressions and features indicative of the former presence of structures or buildings (e.g., standing exterior walls, postholes, foundations) or historic debris (e.g., metal, glass, ceramics). Ground disturbances such as burrows and drainages were also visually inspected (Appendix I). No archaeological resources were identified as a result of the field survey. Visibility of the ground surface across the project site was generally poor (less than 20 percent) as much of the area is covered with standing buildings and structures, hardscape, and landscaping. The small areas of exposed ground surfaces that were inspected by the archaeologist found no evidence of archaeological deposits or remains.

## **Historic Resources Survey**

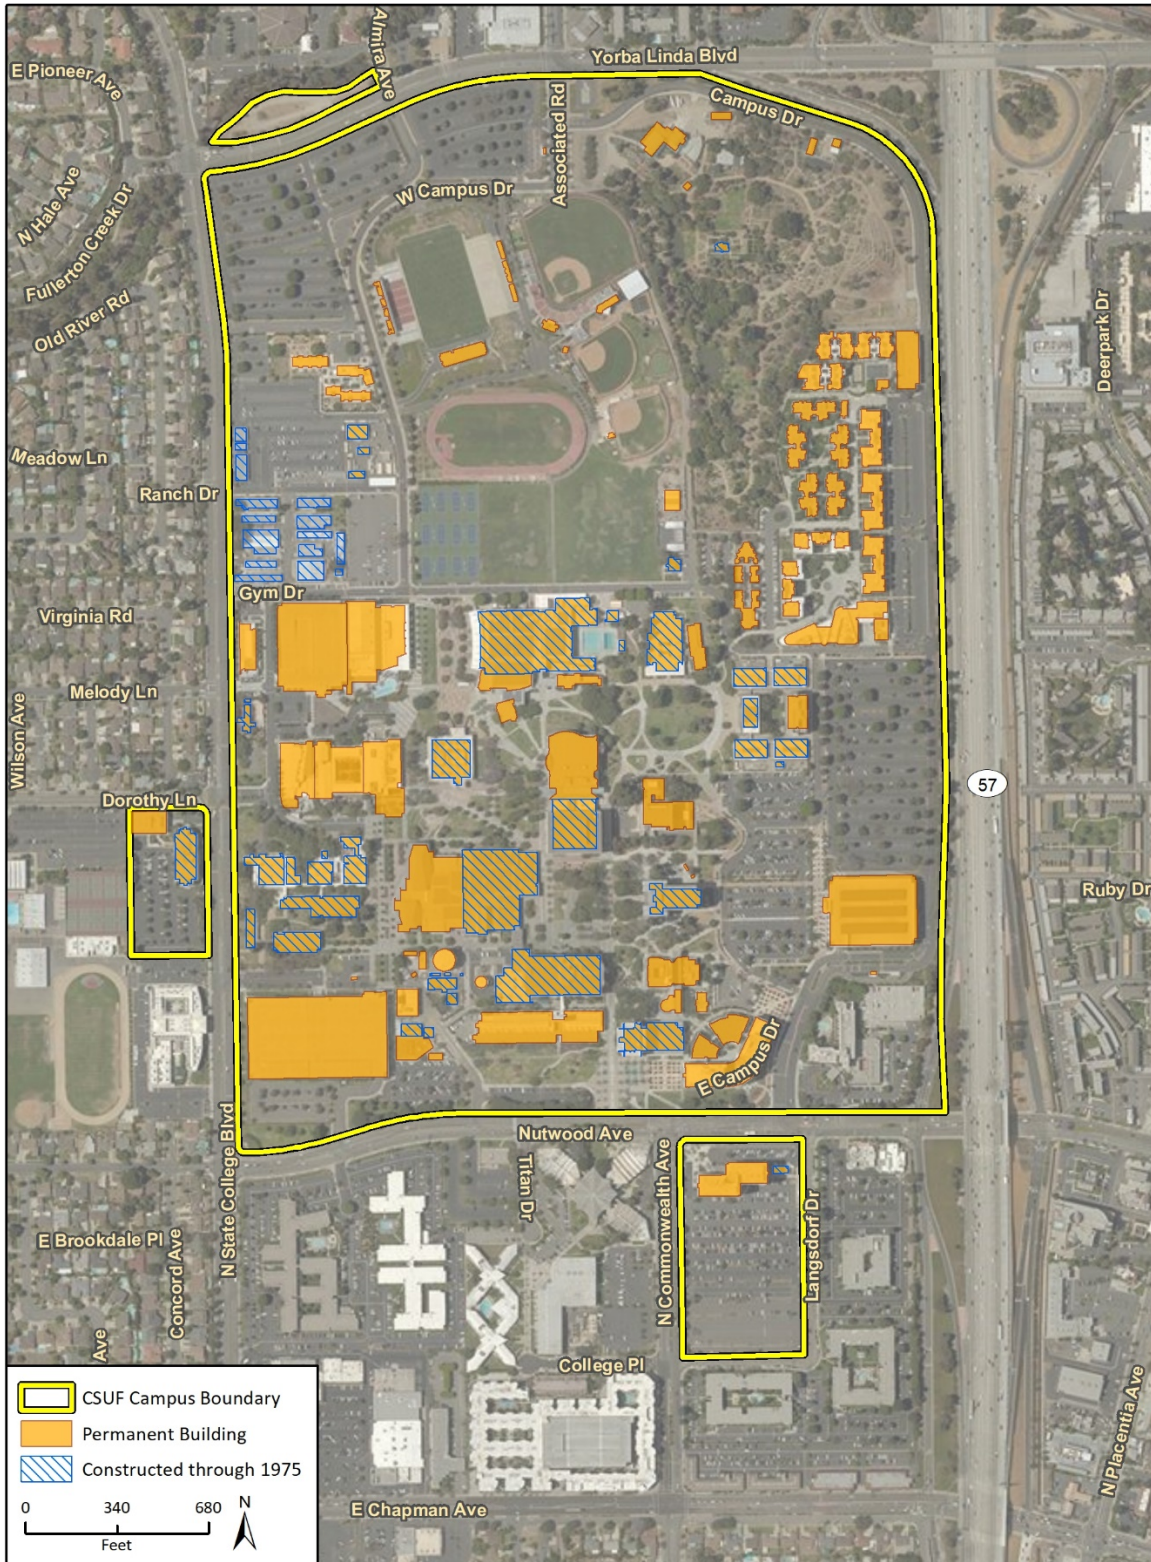

Rincon completed a campus-wide historic resources survey. The objective of this survey is to provide substantial evidence and baseline information to CSUF on qualifying historical resources. Results were presented in a Historic Resources Survey Report, included as Appendix F, and a summary is presented below in Table 4.3-3. The survey included built environment properties 45 years of age and older as shown in Figure 4.3-2; temporary buildings and structures were omitted from the survey. Work efforts included archival research, literature review, and an intensive-level field survey. The NRHP and CRHR eligibility criteria were applied all properties 45 years of age and older. The survey considered buildings, structures, objects, sites, as well as potential historic districts and cultural landscapes in accordance with National Park Service best practice and guidance.

As of 2020, the CSUF campus consists of approximately 118 buildings and structures, both permanent and temporary. A total of 15 permanent CSUF properties fell within the age cut-off for the historic resources survey, as shown in Figure 4.3-3. Among these, a total of 13 were determined eligible for listing on the NRHP and/or CRHR; these properties qualify as historical resources pursuant to CEQA.

**Table 4.3-3 Summary of Historic Resources Survey Results**

	<b>Current (Historical) Building Name</b>	<b>Year</b>	<b>Historical Resource (Criteria)</b>
1	Titan House (Henry T. Hetebrink House)	1886	Yes (A/1, C/3)
2	Heritage House (Dr. George C. Clark House and Office)	1896	Yes (A/1, C/3)
3	George G. Golleher Alumni House (Mahr House)	1931	Yes (A/1, C/3)
4	McCarthy Hall (Letters & Science Building)	1963	Yes (A/1, C/3)
5	Clayes Performing Arts Center (Music-Speech-Drama Building)	1965	Yes (A/1, C/3)
6	Titan Gymnasium/Health Science Building (Physical Education/Gymnasium Building)	1965-1967	Yes (3, CRHR only)
7	Pollak Library (Library)	1966	Yes (A/1, C/3)
8	Book Store/Titan Shops (Cafeteria-Commons Building)	1967	Yes (A/1, C/3)
9	Humanities/Social Sciences Bldg.	1969	Yes (A/1, C/3)
10	Visual Arts Complex (6 buildings)	1969	Yes (A/1, C/3)
11	Langsdorf Hall (Administration Building)	1970	Yes (A/1, C/3)
12	Engineering/ Computer Science (Engineering Building)	1971	No
13	Student Health & Counseling Ctr. (Health Center)	1974	Yes (3, CRHR only)
14	Titan Hall (Western State University College of Law)	1974	Yes (3, CRHR only)
15	Arboretum	1972-1979	No

Figure 4.3-3 Historic Resources Evaluation Results, CSUF Campus

The following section summarizes eligible historical resources, criteria, periods of significance, and contributing elements and features. Full results are included in the HRSR presented in Appendix F.

### #1: Titan House

**Historic Name/Current Name:** Henry T. Hetebrink House/Titan House (1886)  
**Eligible Historical Resource?** Yes, individually eligible  
**Applicable Criteria:** A/1, C/3  
**Period of Significance:** 1886

#### Character-Defining Features:

- One-story massing
- Colonial Revival-influenced style
- Symmetrical design composition
- Hipped roof with interior brick chimney, slight eave overhang, exposed rafter tails
- Exterior brick walls
- Full-width porch with brick base and hipped roof, squared tapered columns and piers
- Rear entry porch with concrete base, wood latticework siding, squared paneled piers, wood balustrade, and glazed doors
- Wood transom windows and casement windows flanking primary entrance
- Double-hung wood windows

#### Overview of Alterations:

- Roof vents
- Double-entry stairs and ADA-accessible ramp on south and east elevations
- Original door appears to have been replaced
- Greenhouse addition along western elevation

#### Reasons Statement:

**Criteria A/1:** The Titan House (Henry T. Hetebrink House), built for and by Fullerton settler and citrus farmer Henry Hetebrink, appears NRHP/CRHR eligible under Criteria A/1, as a rare, intact embodiment of a significant pattern of development: namely, Fullerton’s founding years and early agricultural era.

**Criteria C/3:** The Hetebrink House appears NRHP/CRHR eligible under Criteria C/3 as a rare example of a 19<sup>th</sup>-century Colonial Revival-influenced style home and as one of the oldest brick residences in Orange County.

## #2: Heritage House

**Historic Name/Current Name:** Dr. George C. Clark House and Office/Heritage House (1896)  
**Eligible Historical Resource?** Yes (listed in the NRHP)  
**Applicable Criteria:** A/1, C/3

### Character-Defining Features:

- Architectural focal point and anchor of the CSUF Arboretum complex
- One-and-a-half-story massing
- Eastlake Victorian style
- Asymmetrical design composition
- Wood clapboard wall cladding with corner boards and fish scale detailing on gable ends
- Full-width wrap-around porch with turned wood spindle supports, low wood balustrade, decorative trusses, and spindlework frieze
- Beveled, stained-glass, and single-hung wood windows
- Sunburst and basket weaving motifs in window surrounds
- Rear bay window capped with gable roof featuring elaborate ornamented gable detailing and roof cresting

### Overview of Alterations:

- Moved to current site in 1972
- Reconstructed steeply pitched hipped with cross gabled roof; cedar shingle sheathing; interior brick chimneys and ornate gables
- Rear ADA-accessible ramp
- Interior spaces re-plastered

### Reasons Statement:

**Criteria A/1:** The Heritage House (Dr. George C. Clark House and Office) is listed on the NRHP. The property appears NRHP/CRHR eligible under Criteria A/1, as a rare, intact embodiment of a significant pattern of development: namely, Fullerton's founding years and early agricultural era.

**Criteria C/3:** The Heritage House appears NRHP/CRHR eligible under Criteria C/3 as one of the last remaining examples of the Eastlake Victorian style in Fullerton (C/3) and an intact exemplification of Fullerton’s founding years (A/1).

### #3: George G. Golleher Alumni House

**Historic Name/Current Name:** Mahr House/George G. Golleher Alumni House (1931)  
**Eligible Historical Resource?** Yes (individually eligible)  
**Applicable Criteria:** C/3  
**Period of Significance:** 1931

#### Character-Defining Features:

- Two-story massing
- Spanish Colonial Revival style
- Asymmetrical design composition with central rectangular body and various wings
- Flat and gable roof clad in red clay tiles with exposed rafter tails
- Battered stucco-clad exterior
- Central courtyard with fountain featuring stucco- and tile-clad base
- Balconies with double wood doors
- Inset balcony along eastern elevation with squared piers
- Paired wood casement windows

#### Overview of Alterations:

- Building appears to have been re-stuccoed, possibly in 1960
- North wing addition
- Concrete Masonry Unit (CMU) stucco-clad wall with archway entrance and rear arcade
- Tile flooring of interior courtyard
- Wood gate entrances along eastern elevation
- Modern light sconces
- Wood pergola

#### Reasons Statement:

**Criteria C/3:** The George G. Golleher Alumni House (Mahr House) appears NRHP/CRHR eligible under Criteria C/3 as an intact, distinctive example of the Spanish Colonial Revival style.

## CSUF Campus Core Historic District

**Criteria A/1 eligibility:** The CSUF Campus Core Historic District is eligible as an intact, cohesive collection of institutional properties built during CSUF’s founding years. The historic district exemplifies institutional/educational facility expansion in Fullerton during the City’s postwar transformation.

**Period of significance:** 1963 – 1970

**Criteria C/3 eligibility:** The CSUF Campus Core Historic District is also eligible as a distinctive, outstanding example of the New Formalist/Late Modern architectural style, applied to institutional properties/educational facilities. The district represents one of the most expansive and intact collections of New Formalist/Late Modern architecture in Fullerton.

**Period of Significance:** 1963 – 1970

**Historic District Description:** The Campus Core Historic District is a cohesive, distinctive grouping of the earliest buildings designed for CSUF during its most active construction phase. The district exemplifies the rapid, widespread postwar expansion of Fullerton, both in terms of population growth and new construction (Criteria A/1). In addition, with its unified site plan, distinctive architectural style, associated landscaping and hardscaping features, the Campus Core Historic District represents one of Fullerton’s most extensive and intact collections of New Formalist/Late Modern architecture (Criteria C/3).

Primary contributors to the historic district are McCarthy Hall; Clays Performing Arts Center; Pollak Library; Humanities and Social Sciences Building, and Langsdorf Hall. The five buildings that contribute to the historic district are unified but distinctive expressions of New Formalism/Late Modern architectural style. They exhibit an emphasis on monumentality; the use of smooth white and natural-toned concrete exteriors; and repeating hexagonal motifs. A unified site design, with shared circulation and view corridors, landscaping/hardscaping features, and a shared central quad; also contribute to the historic district.

Figure 4.3-4 Panoramic Views of Campus Core Historic District

Source: Rincon Consultants, 2019

## #4: McCarthy Hall

**Historic Name/Current Name:** Letters and Science Building/McCarthy Hall (1963)  
**Eligible Historical Resource?** Yes; contributor to Campus Core Historic District  
**Applicable Criteria:** A/1; C/3  
**Period of Significance:** 1963 – 1970 (historic district)

### Character-Defining Features:

- Site plan/design, with mature landscaping and siting in relation to other buildings
- Axial, north-south circulation corridor/sight line flanking building
- New Formalist/Late Modern architectural style; symmetrical design composition; smooth white concrete cladding
- Six-story monumental massing; flat roof
- Projecting walkways with low metal fences on lower stories; screen enclosures
- Walkways with full-height concrete screens with honeycomb-patterned perforations
- Thirteen shallow, full-height projecting arches spanning north and south elevations; windows recessed within full-height arches
- Precast textured concrete panels and aluminum lettering along southern elevation
- North elevation entrance with central roll-up grille with low-slope concrete ramps

### Overview of Alterations:

- Connecting second-story walkway between southern and northern elevations

### Reasons Statement:

**Criteria A/1 eligibility:** McCarthy Hall is a contributor to the Campus Core Historic District, eligible under NRHP/CRHR Criteria A/1 as an intact, cohesive collection of institutional properties built during CSUF's founding years. The district exemplifies a significant pattern of development: institutional/educational facility expansion during the City's postwar boom and transformation.

**Criteria C/3 eligibility:** McCarthy Hall is a contributor to the Campus Core Historic District, eligible for NRHP/CRHR listing under Criteria C/3 for its distinctive New Formalist/Late Modern architectural style. The CSUF Campus Core Historic District, along with its associated landscaping and hardscaping features, represents one of Fullerton's most extensive and intact collections of New Formalist/Late Modern architecture.

## #5: Clayes Performing Arts Center

**Historic Name/Current Name:** Music-Speech-Drama Bldg/Clayes Performing Arts Ctr (1965)  
**Eligible Historical Resource?** Yes; contributor to Campus Core Historic District  
**Applicable Criteria:** A/1; C/3  
**Period of Significance:** 1963 – 1970 (historic district)

### Character-Defining Features:

- Site plan/design, with mature landscaping and siting in relation to other three buildings in quad
- Axial, north-south circulation corridor/sight line flanking building
- Mostly two- to three-story massing
- Monumental mass/volume and repeating geometric hexagonal pattern
- New Formalist/Late Modern architectural style
- Symmetrical design composition; smooth concrete exterior; capped with flat roof
- Pre-cast concrete screen panel perforated with elongated hexagonal voids to form a complex honeycomb pattern.
- Concrete panels along north and east elevations
- Ribbons of fixed aluminum windows
- Covered walkway with folded plate roof

### Overview of Alterations:

- Addition on west elevation in 2000
- Solar panel installation on roof

### Reasons Statement:

**Criteria A/1 eligibility:** Clayes Performing Arts Center is a contributor to the Campus Core Historic District, eligible under NRHP/CRHR Criteria A/1 as an intact, cohesive collection of institutional properties built during CSUF's founding years. The district exemplifies a significant pattern of development: institutional/educational facility expansion during the City's postwar boom and transformation.

**Criteria C/3 eligibility:** Clayes Performing Arts Center is a contributor to the Campus Core Historic District, eligible for NRHP/CRHR listing under Criteria C/3 for its distinctive New Formalist/Late Modern architectural style. The CSUF Campus Core Historic District, along with its associated landscaping and hardscaping features, represents one of Fullerton's most extensive and intact collections of New Formalist/Late Modern architecture.

## #6: Pollak Library

**Historic Name/Current Name:** Library/Pollak Library (1966)  
**Eligible Historical Resource?** Yes; contributor to Campus Core Historic District  
**Applicable Criteria:** A/1; C/3  
**Period of Significance:** 1963 – 1970 (historic district)

### Character-Defining Features:

- Site plan/design, with mature landscaping and unified spatial relationships
- Axial, north-south circulation corridor/sight line flanking building
- Five-story massing; box-like shape supported by concrete, beveled golf tee-shaped legs
- New Formalist/Late Modern architectural style; symmetrical design composition
- Flat roof with minimal eave overhang
- Smooth natural-colored concrete base
- Projecting, honeycomb-patterned concrete screen applied to main elevations
- Wide, low entrance terrace facing quad

### Overview of Alterations:

- Addition on north elevation circa 2003
- Removed material on west/south elevations

### Reasons Statement:

**Criteria A/1 eligibility:** The Pollak Library is a contributor to the Campus Core Historic District, eligible under NRHP/CRHR Criteria A/1 as an intact, cohesive collection of institutional properties built during CSUF’s founding years. The district exemplifies a significant pattern of development: institutional/educational facility expansion during the City’s postwar boom and transformation.

**Criteria C/3 eligibility:** The Pollak Library is a contributor to the Campus Core Historic District, eligible for NRHP/CRHR listing under Criteria C/3 for its distinctive New Formalist/Late Modern architectural style. The CSUF Campus Core Historic District, along with its associated landscaping and hardscaping features, represents one of Fullerton’s most extensive and intact collections of New Formalist/Late Modern architecture.

## #7: Humanities and Social Sciences Building

<b>Historic Name/Current Name:</b>	<b>Humanities and Social Sciences Building (1969)</b>
<b>Eligible Historical Resource?</b>	<b>Yes; contributor to Campus Core Historic District</b>
<b>Applicable Criteria:</b>	<b>A/1; C/3</b>
<b>Period of Significance:</b>	<b>1963 – 1970 (historic district)</b>

### Character-Defining Features:

- Site plan/design, with mature landscaping and siting in relation to other three buildings in quad
- Axial, north-south circulation corridor/sight line flanking building
- Mass/volume; seven stories supported by recessed beveled golf tee-shaped legs
- New Formalist/Late Modern architectural style
- Symmetrical design composition
- Flat roof
- Exteriors of smooth natural-colored concrete and featuring a repeating hexagonal pattern
- Elongated vertical bands on west elevation with evenly placed hexagonal medallions creates screen

### Overview of Alterations:

- Industrial doors appear nonoriginal

### Reasons Statement:

**Criteria A/1 eligibility:** The Humanities and Social Sciences Building is a contributor to the Campus Core Historic District, eligible under NRHP/CRHR Criteria A/1 as an intact, cohesive collection of institutional properties built during CSUF's founding years. The district exemplifies a significant pattern of development: institutional/educational facility expansion during the City's postwar boom and transformation.

**Criteria C/3 eligibility:** The Humanities and Social Sciences Building is a contributor to the Campus Core Historic District, eligible for NRHP/CRHR listing under Criteria C/3 for its distinctive New Formalist/Late Modern architectural style. The CSUF Campus Core Historic District, along with its associated landscaping and hardscaping features, represents one of Fullerton's most extensive and intact collections of New Formalist/Late Modern architecture.

## #8: Langsdorf Hall

**Historic Name/Current Name:** Administration Building/Langsdorf Hall (1970)  
**Eligible Historical Resource?** Yes; contributor to Campus Core Historic District  
**Applicable Criteria:** A/1; C/3  
**Period of Significance:** 1963 – 1970 (historic district)

### Character-Defining Features:

- Unified site plan/design, with mature landscaping and connecting corridors
- Situated behind central fountain
- Nine-story central cross-shaped body with three-story eastern wing supported by concrete, beveled golf tee-shaped legs; columns form a sheltered arcade
- New Formalist/Late Modern architectural style
- Symmetrical design composition; flat roof
- Exteriors of smooth natural-colored concrete and featuring central repeating hexagonal patterns on each elevation; cells frame long, narrow windows
- South elevation features deeply recessed two-story entrance with curtain wall
- Concrete terrace on north elevation; diagonal U-shaped staircases

### Overview of Alterations:

- Windows and doors along north elevation of wing appear to be nonoriginal

### Reasons Statement:

**Criteria A/1 eligibility:** Langsdorf Hall is a contributor to the Campus Core Historic District, eligible under NRHP/CRHR Criteria A/1 as an intact, cohesive collection of institutional properties built during CSUF's founding years. The district exemplifies a significant pattern of development: institutional/educational facility expansion during the City's postwar boom and transformation.

**Criteria C/3 eligibility:** Langsdorf Hall is a contributor to the Campus Core Historic District, eligible for NRHP/CRHR listing under Criteria C/3 for its distinctive New Formalist/Late Modern architectural style. The CSUF Campus Core Historic District, along with its associated landscaping and hardscaping features, represents one of Fullerton's most extensive and intact collections of New Formalist/Late Modern architecture.

## #9: Titan Gymnasium/Kinesiology & Health Science Building

**Historic Name/Current Name:** Physical Ed and Gymnasium Bldg/Titan Gymnasium/  
Kinesiology & Health Science Building (1965-1967)

**Eligible Historical Resource?** Yes, individually eligible (due to site plan alterations/recent in-fill, this property is not a contributor to the Campus Core Historic District)

**Applicable Criteria:** CRHR 1/3 (Not NRHP eligible due to alterations)

**Period of Significance:** 1965 – 1967

### Character-Defining Features:

- Site plan/design, with mature landscaping; one-story massing of geometric volumes
- Repeating hexagonal pattern on vertically projecting concrete volume
- New Formalist/Late Modern architectural style; flat roof
- Recessed entrance, raised terrace, and multi-colored brick hardscaping
- Folded plate roofs with tapered squared columns along north and west elevations
- Band of industrial doors on west elevation; concrete benches with tapered pier legs
- Smooth brick and concrete exterior

### Overview of Alterations:

- Addition on east/south elevations circa 2003
- Solar panel installation on roof

### Reasons Statement:

**Criteria 1 eligibility:** Titan Gymnasium appears CRHR eligible under Criteria 1 for its exemplification of Fullerton’s rapid and extensive institutional growth and building boom in the postwar period. The building reflects a significant pattern of development in Fullerton: namely, that of institutional/educational facility expansion during the City’s postwar period.

**Criteria 3 eligibility:** Titan Gymnasium appears CRHR eligible under Criteria 3 for its intact, distinctive New Formalist/Late Modern architectural style. The contributing features of the resource include the general site plan, surrounding hardscaping, and the concrete plaza that connects the building to the Titan Shop/Book Store. Due to alterations (including additions in 2003), the Titan Gymnasium is not recommended eligible for the NRHP.

## #10: Titan Shop/Book Store

**Historic Name/Current Name:**  
**Eligible Historical Resource?**

**Cafeteria-Commons Building/Titan Shop/Book Store (1967)**  
**Yes, individually eligible** (due to site plan alterations/recent in-fill, this property is not a contributor to the Campus Core Historic District)

**Applicable Criteria:**

**A/1; C/3**

**Period of Significance:**

**1967**

### **Character-Defining Features:**

- Site plan/design, with mature landscaping
- Rectangular form; New Formalist/Brutalist architectural style
- Symmetrical design composition
- Inverted umbrella shell roof upheld by tapered columns; cantilevered roof eaves
- Concrete-clad exterior walls; walls marked with procession of attached concrete piers with reverse tapering
- Curtain walls and bands of windows with slightly raised mullions, emphasizing verticality
- Squared 'U'-shaped diagonal concrete ramps/stairs with raised sides on north and south elevations
- Tapered rectangular planters at southern end, raised concrete walls, and gradually stepped platform, emphasizing the building's material and monumentality

### **Overview of Alterations:**

- Industrial doors appear to be nonoriginal

### **Reasons Statement:**

**Criteria 1 eligibility:** Titan Shop/Book Store appears NRHP/CRHR eligible under Criteria A/1 for its exemplification of Fullerton's rapid and extensive institutional growth and building boom in the postwar period. The building reflects a significant pattern of development in Fullerton: namely, that of institutional/educational facility expansion during the City's postwar period.

**Criteria 3 eligibility:** Titan Shop/Book Store appears NRHP/CRHR eligible under Criteria C/3 for its distinctive, intact New Formalist/Brutalist architectural style. Contributing elements include the surrounding hardscaping and concrete plaza connecting the building to the Titan Gymnasium.

## #11: Engineering and Computer Science Building Complex

<b>Historic Name/Current Name:</b>	<b>Engineering Building/ Engineering and Computer Science Building Complex</b>
<b>Year of Construction:</b>	<b>1971</b>
<b>Architect/Designer/Contractor:</b>	<b>Tutor-Myers Co.</b>
<b>Eligible Historical Resource?</b>	<b>No</b>
<b>Applicable Criteria:</b>	<b>N/A</b>

### **Character-Defining Features:**

- N/A

### **Overview of Alterations:**

- Western building in complex constructed in 1988

### **Reasons Statement:**

The Engineering and Computer Science Building Complex exhibits some of the character-defining features of the New Formalist/Late Modernist architectural style. However, the complex overall, seen in the context of similar buildings on campus, is an example but not a distinctive example of its architectural style.

In addition, research did not indicate that the building is associated with any significant events or patterns of development.

The building complex also does not appear to meet NRHP Criterion G.

Therefore, it is not eligible for either the NRHP or CRHR and is not a historical resource pursuant to CEQA.

## #12: Student Health & Counseling Center

**Historic Name/Current Name:**

**Health Center/Student Health & Counseling Center (1974)**

**Eligible Historical Resource?**

**Yes, individually eligible** (due to site plan alterations/in-fill, this property is not a contributor to the Campus Core Historic District)

**Applicable Criteria:**

**1/3 (CRHR only)**

**Period of Significance:**

**1974**

**Character-Defining Features:**

- Site plan/design, with mature landscaping and stepped retaining wall; benches; large central lawn with mature trees
- Mass/symmetrical design composition; emphasis on horizontality; Mid-Century Modern/Late Modernism architectural style; ribbon windows
- Paired paneled concrete doors; heavy projecting roof slab with overhanging eaves and pronounced fascia; repeating rectangles and squares with dropped lights
- Wrap-around colonnade; temple-like form; smooth concrete exteriors; hexagonal decorative motif

**Overview of Alterations:**

- Doors along east elevation appear to be unoriginal

**Reasons Statement:**

**Criteria 1 eligibility:** The Student Health & Counseling Center appears CRHR eligible under Criteria 1 for its exemplification of Fullerton's rapid and extensive institutional growth and building boom in the postwar period. Due to its age (fewer than 50 years old), the building is not recommended eligible for the NRHP under Criteria A at this time.

**Criteria 3 eligibility:** The Student Health & Counseling Center appears CRHR eligible under Criteria 3 for its distinctive Mid-Century Modern/Late Modernist architectural style. Due to its age (fewer than 50 years old), the building is not recommended eligible for the NRHP at this time. Contextual information on Mid-Century Modern/Late Modern architecture in Fullerton does not exist to demonstrate that the building meets NRHP Criterion G (for exceptional significance for properties under 50 years of age). The NRHP criteria can be reassessed once such information is available or the building turns 50 years of age.

### #13: Titan Hall

**Historic Name/Current Name:** Western State University College of Law/Titan Hall (1974)  
**Eligible Historical Resource?** Yes, individually eligible (due to its location, this property is not a contributor to the Campus Core Historic District)  
**Applicable Criteria:** 1/3 (CRHR only)  
**Period of Significance:** 1974

**Character-Defining Features:**

- Three-story massing; emphasis on verticality; New Formalist/Late Modernism style; symmetrical design composition
- Flat roof with slightly overhanging eave; tiered appearance from end bays
- Building form accentuated with thick fascia and belt course; smooth concrete exterior; ribbon windows with thick surrounds
- Bays on north and south elevations characterized by a tall central projection flanked by two smaller towers, rough concrete masonry units (CMUs), and column of fixed windows capped with flat roof
- Recessed entrance features floor-to-ceiling windows and industrial doors

**Overview of Alterations:**

- N/A

**Reasons Statement:**

**Criteria 1 eligibility:** Titan Hall appears CRHR eligible under Criteria 1 for its exemplification of Fullerton’s rapid and extensive institutional growth and building boom in the postwar period. Due to its age (fewer than 50 years old), the building is not recommended eligible for the NRHP under Criteria A at this time.

**Criteria 3 eligibility:** Titan Hall appears CRHR eligible under Criteria 3 for its distinctive New Formalist/Late Modernist architectural style. Due to its age (fewer than 50 years old), the building is not recommended eligible for the NRHP at this time. Although it is a distinctive example of its style, contextual information on New Formalism/Late Modern architecture in Fullerton as a whole does not exist to demonstrate that the building meets NRHP Criterion G (for exceptional significance for properties under 50 years of age). The NRHP criteria can be reassessed once such information is available or the building turns 50 years of age.

## #14: Visual Arts Building Complex

<b>Historic Name/Current Name:</b>	<b>Visual Arts Building/Visual Arts Building Complex (1969)</b>
<b>Eligible Historical Resource?</b>	<b>Yes, multiple-property resource</b>
<b>Applicable Criteria:</b>	<b>A/1; C/3</b>
<b>Period of Significance:</b>	<b>1969-1970</b>

### Character-Defining Features:

- One-to-two-story massing; horizontal design composition; geometric volumes
- Mid-Century Modern architectural style
- Complex of buildings connected by sheltered breezeways/arcades with flat roofs supported by squared columns
- Flat roof; exteriors of smooth concrete
- Modular design and brick pathways
- Post-and-beam construction
- Bands of sliding aluminum windows
- Grid-like screens above doorways
- Large water feature in center of complex
- Exterior spaces sectioned off with wood fences
- “Water Wall” sculpture by Ray Heins (1970)

### Overview of Alterations:

- N/A

### Reasons Statement:

**Criteria A/1 eligibility:** Visual Arts Building Complex appears NRHP/CRHR eligible under Criteria A/1 for its exemplification of Fullerton’s rapid and extensive institutional growth and building boom in the postwar period. The complex reflects a significant pattern of development in Fullerton: namely, that of institutional/educational facility expansion during the City’s postwar period.

**Criteria C/3 eligibility:** The Visual Arts Building Complex appears NRHP/CRHR eligible under Criteria C/3 for its distinctive Mid-Century Modernist architectural style. Although originally included in the 1962 Master Plan, the Visual Arts Building Complex was not constructed until 1969 and is physically separated and stylistically differentiated from the CSUF’s historic core. The complex’s modular, post-and-beam style is typical of Mid-Century Modern institutional architecture. The 1970 “Water Wall” sculpture, reflecting pool, and courtyard contribute to this complex.

## Arboretum

<b>Historic Name/Current Name:</b>	<b>Arboretum (1972-1979)</b>
<b>Eligible Historical Resource?</b>	<b>No</b>
<b>Applicable Criteria:</b>	<b>N/A</b>

### Character-Defining Features:

- N/A

### Overview of Alterations:

- N/A

### Evaluation Summary:

The Arboretum, primarily developed in 1977-1979 and past the survey target for this study, warrants evaluation once all of its components reach 45 years of age. Although there appear to be eight surviving Valencia orange trees on the campus, including several on the site of the Arboretum, available literature did not reveal their location or origins. Once the components of the Arboretum reach 45 years of age, it is recommended that additional archival research and a subsequent survey, with a team including a preservation professional and arborist, be undertaken.

## 4.3.2 Regulatory Setting

### a. Federal

#### National Historic Preservation Act

The National Historic Preservation Act (NHPA) is the federal law that establishes the nation’s policy for historic preservation and governs the treatment of cultural resources. Under Section 106 of the NHPA, when a federal agency is involved in an undertaking, it must account for the effects of the undertaking on historic properties. Historic properties are those that meet criteria for inclusion on the National Register of Historic Places (NRHP). Federal agencies issuing permits for the project are required to comply with NHPA requirements.

#### National Register of Historic Places

The National Register of Historic Places (NRHP) was established by the National Historic Preservation Act of 1966 as “an authoritative guide to be used by federal, State, and local governments, private groups and citizens to identify the Nation’s cultural resources and to indicate what properties should be considered for protection from destruction or impairment” (CFR 36 CFR 60.2). The NRHP recognizes properties that are significant at the national, state, and local levels. To be eligible for listing in the NRHP, a resource must be significant in American history, architecture, archaeology, engineering, or culture. A property is eligible for the NRHP if it:

- Criterion A:** Is associated with events that have made a significant contribution to the broad patterns of our history; or
- Criterion B:** Is associated with the lives of persons significant in our past; or
- Criterion C:** Embodies the distinctive characteristics of a type, period, or method of installation, or represents the work of a master, possesses high artistic values, or represents a significant and distinguishable entity whose components may lack individual distinction; or
- Criterion D:** Has yielded, or may be likely to yield, information important in prehistory or history.

In addition to meeting these criteria, a property must retain historic integrity, which is defined in National Register Bulletin 15 as the “ability of a property to convey its significance” (National Park Service 1990). In order to assess integrity, the National Park Service recognizes seven aspects or qualities that, considered together, define historic integrity. To retain integrity, a property must possess several, if not all, of these seven qualities, which are defined in the following manner in National Register Bulletin 15:

1. **Location.** The place where the historic property was constructed or the place where the historic event occurred.
2. **Design.** The combination of elements that create the form, plan, space, structure, and style of a property.
3. **Setting.** The physical environment of a historic property.
4. **Materials** are the physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property.

5. **Workmanship.** The physical evidence of the crafts of a particular culture or people during any given period in history or prehistory.
6. **Feeling.** A property's expression of the aesthetic or historic sense of a particular period of time.
7. **Association.** The direct link between an important historic event or person and a historic property.

Some aspects of integrity may be accorded more weight than others, depending on the type of resource being evaluated and the applicable eligibility criteria. Integrity can be assessed only after it has been concluded that a resource is significant.

### ***Secretary of the Interior's Standards for Rehabilitation***

In accordance with the National Park Service and CEQA Guidelines, projects that comply with the *Secretary's Standards for the Treatment of Historic Properties* and *Secretary's Standards for Rehabilitation (Secretary's Standards)* are projects that retain the historic integrity of the resource. According to CEQA Guidelines, a project that complies with the *Secretary's Standards* is generally considered to be a project that will not cause a significant adverse impact to a historical resource.

The goal of the *Secretary's Standards* is to outline treatment approaches that allow for the retention of and/or sensitive changes to the distinctive materials and features that lend a historical resource its significance. The *Secretary's Standards* and Guidelines offer general recommendations for preserving, maintaining, repairing, and replacing historical materials and features, as well as designing new additions or making alterations. These standards also provide guidance on new construction adjacent to historic districts and properties, in order to ensure that there are no indirect adverse impacts to historic properties.

Rehabilitation is the most flexible treatment approach of the *Secretary's Standards*. The ten *Secretary's Standards for Rehabilitation* are:

1. A property shall be used for its historic purpose or be placed in a new use that requires minimal change to the defining characteristics of the building and its site and environment.
2. The historic character of a property shall be retained and preserved. The removal of historic materials or alteration of features and spaces that characterize a property shall be avoided.
3. Each property shall be recognized as a physical record of its time, place, and use. Changes that create a false sense of historical development, such as adding conjectural features or architectural elements from other buildings, shall not be undertaken.
4. Most properties change over time; those changes that have acquired historic significance in their own right shall be retained and preserved.
5. Distinctive features, finishes, and construction techniques or examples of craftsmanship that characterize a property shall be preserved.
6. Deteriorated historic features shall be repaired rather than replaced. Where the severity of deterioration requires replacement of a distinctive feature, the new feature shall match the old in design, color, texture, and other visual qualities and, where possible, materials. Replacement of missing features shall be substantiated by documentary, physical, or pictorial evidence.

7. Chemical or physical treatments, such as sandblasting, that cause damage to historic materials shall not be used. The surface cleaning of structures, if appropriate, shall be undertaken using the gentlest means possible.
8. Significant archeological resources affected by a project shall be protected and preserved. If such resources must be disturbed, mitigation measures shall be undertaken.
9. New additions, exterior alterations, or related new construction shall not destroy historic materials that characterize the property. The new work shall be differentiated from the old and shall be compatible with the massing, size, scale, and architectural features to protect the historic integrity of the property and its environment.
10. New additions and adjacent or related new construction shall be undertaken in such a manner that if removed in the future, the essential form and integrity of the historic property and its environment would be unimpaired.

The *Secretary's Standards and Guidelines* offer general recommendations for preserving, maintaining, repairing, and replacing historical materials and features, as well as designing new additions or making alterations. The *Secretary's Standards for Rehabilitation* also provide guidance on new construction adjacent to historic districts and properties, in order to ensure that there are no adverse indirect impacts to integrity as a result of a change in setting. Applying the *Secretary's Standards* to new construction adjacent to historic resources helps ensure avoidance of indirect impacts and retention of the setting and feeling of the historic resource and its surrounding environment.

Secretary's Standards compliance begins with the identification and documentation of the "character-defining," or historically significant, features of the historical resource. According to Preservation Brief 17, *Architectural Character: Identifying the Visual Aspects of Historic Buildings as an Aid to Preserving Their Character*, there is a three-step process to identifying character-defining features (Nelson, 1982). Step 1 involves assessing the physical aspects of the building exterior as a whole, including its setting, shape and massing, orientation, roof and roof features, projections, and openings. Step 2 looks at the building more closely—at materials, trim, secondary features, and craftsmanship. Step 3 encompasses the interior, including individual spaces, relations or sequences of spaces (floor plan), surface finishes and materials, exposed structure, and interior features and details. Alterations and replacement of character-defining features over time can impair a historic property's integrity and result in a loss of historic status. Therefore, to ensure that a historic property remains eligible after implementation of projects, character-defining features should be identified and preserved.

## Native American Involvement

Several federal and state laws address Native American involvement in the development review process. The most notable of these are the federal Native American Graves Protection and Repatriation Act (1990) and the California Native American Graves Protection and Repatriation Act (2001). These acts ensure that Native American human remains and cultural items be treated with respect and dignity.

### b. State

The policies of the NHPA are implemented at the state level by the California Office of Historic Preservation, a division of the California Department of Parks and Recreation. The Office of Historic

Preservation is also tasked with carrying out the duties described in the Public Resources Code and maintaining the California Historic Resources Inventory and CRHR. The state-level regulatory framework also includes CEQA, which requires the identification and mitigation of substantial adverse impacts that may affect the significance of eligible historical and archeological resources.

## California Public Resources Code

California Public Resources Code (PRC), Sections 5097-5097.6, state that the unauthorized disturbance or removal of archaeological, historical, or paleontological resources located on public lands is a misdemeanor. Paleontological resources are further addressed in Section 4.6, *Geology and Soils*. The PRC prohibits the knowing destruction of objects of antiquity without a permit (express permission) on public lands, and it provides for criminal sanctions. This section was amended in 1987 to require consultation with the Native American Heritage Commission (NAHC) whenever Native American graves are found. Violations that involve taking or possessing remains or artifacts are felonies. As such, PRC Section 5097.5 states:

A person shall not knowingly and willfully excavate upon, or remove, destroy, injure, or deface, any historic or prehistoric ruins, burial grounds, archaeological or vertebrate paleontological site, including fossilized footprints, inscriptions made by human agency, rock art, or any other archaeological, paleontological or historical feature, situated on public lands, except with the express permission of the public agency having jurisdiction over the lands....A violation of this section is a misdemeanor.

Here “public lands” means those owned by or under the jurisdiction of the state or any city, county, district, authority, public corporation, or any agency thereof. Consequently, local agencies are required to comply with PRC Section 5097.5 for their own activities, including construction and maintenance, as well as for permit actions (e.g., encroachment permits) undertaken by others.

## California Register of Historical Resources

Created in 1992 and implemented in 1998, the CRHR is a guide for state and local agencies, private groups, and citizens to identify historical resources and those properties that should be protected, to the extent prudent and feasible, from substantial adverse change. Certain properties, including those listed in or formally determined eligible for listing on the NRHP and California Historical Landmarks numbered 770 and higher, are automatically included on the CRHR.

According to PRC Section 5024.1(c), a resource, either an individual property or a contributor to a historic district, may be listed in the CRHR if the State Historical Resources Commission determines that it meets one or more of the following criteria, which are modeled on NRHP criteria:

- Criterion 1:** It is associated with events that have made a significant contribution to the broad patterns of California’s history and cultural heritage
- Criterion 2:** It is associated with the lives of persons important in our past
- Criterion 3:** It embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values
- Criterion 4:** Has yielded, or may be likely to yield, information important in prehistory or history

Properties that do not retain sufficient integrity for NRHP listing can still qualify for listing in the CRHR. Historical resources eligible for listing in the California Register must meet one of the criteria of significance described above and retain enough of their historic character or appearance to be recognizable as historical resources and to convey the reasons for their significance.

## California Environmental Quality Act

As the Lead Agency for the proposed project, CSUF is subject to the provisions of CEQA, which requires a lead agency to determine whether a project may have a significant effect on historical resources (PRC Section 21084.1). Under CEQA, a “project that may cause a substantial adverse change in the significance of a historic resource is a project that may have a significant effect on the environment” (PRC Section 21084.1). The following CEQA statutes (PRC Section 21000 et seq.) and state CEQA Guidelines (14 CCR Section 15000 et seq.) are relevant to the analysis of archaeological, historic, and tribal cultural resources:

- PRC Section 21083.2(g) defines “unique archaeological resource” as an artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it does one or more of the following:
  - A. Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.
  - B. Has a special and particular quality such as being the oldest of its type or the best available example of its type.
  - C. Is directly associated with a scientifically recognized important prehistoric or historic event or person.
- The State CEQA Guidelines Section 15064.5(a) defines “historical resources” as:
  - A. A resource listed in or determined to be eligible by the State Historical Resources Commission, for listing in the CRHR (PRC Section 5024.1).
  - B. A resource included in a local register of historical resources, as defined in PRC Section 5020.1(k) or identified as significant in a historical resource survey meeting the requirements of PRC Section 5024.1(g), will be presumed to be historically or culturally significant. Public agencies must treat any such resource as significant unless the preponderance of evidence demonstrates that it is not historically or culturally significant.
  - C. Any object, building, structure, site, area, place, record, or manuscript which a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California may be considered to be a historical resource, provided the lead agency’s determination is supported by substantial evidence in light of the whole record. Generally, a resource will be considered by the lead agency to be historically significant if it meets the following criteria for listing in the CRHR (PRC Section 5024.1):
    1. Is associated with events that have made a significant contribution to the broad patterns of California’s history and cultural heritage;
    2. Is associated with the lives of persons important in our past;
    3. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or
    4. Has yielded, or may be likely to yield, information important in prehistory or history.

D. The fact that a resource is not listed in or determined to be eligible for listing in the CRHR, not included in a local register of historical resources (pursuant to PRC Section 5020.1(k)), or identified in a historical resources survey (meeting the criteria in PRC Section 5024.1(g)) does not preclude a lead agency from determining that the resource may be a historical resource as defined in PRC Sections 5020.1(j) and 5024.1.

- In addition, Section 15064.5(b) of the CEQA Guidelines specify that “substantial adverse change in the significance of an historical resource means physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired.” Material impairment occurs when a project alters in an adverse manner or demolishes “those physical characteristics of an historical resource that convey its historical significance and that justify its inclusion” or eligibility for inclusion in the NRHR, CRHR, or local register.

In addition, pursuant to CEQA Guidelines Section 15126.2, the “direct and indirect significant effects of the project on the environment shall be clearly identified and described, giving due consideration to both the short-term and long-term effects.” In terms of indirect impacts, pursuant to CEQA Guidelines, Section 15378, study of a project under CEQA requires consideration of “the whole of an action, which has the potential for resulting in either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment.”

CEQA Guidelines, Section 15064d further define direct and indirect impacts:

- A. A direct physical change in the environment is a physical change in the environment which is caused by and immediately related to the project.
- B. An indirect physical change in the environment is a physical change in the environment, which is not immediately related to the project, but which is caused indirectly by the project. If a direct physical change in the environment in turn causes another change in the environment, then the other change is an indirect physical change in the environment.
- PRC Section 21074(a) defines “tribal cultural resources” as either of the following:
  - A. Sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe that are either of the following:
    1. Included or determined to be eligible for inclusion in the CRHR.
    2. Included in a local register of historical resources as defined in PRC Section 5020.1(k).
  - B. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in PRC Section 5024.1(c). The lead agency shall consider the significance of the resource to a California Native American Tribe.
- Section 15064.5 of the CEQA Guidelines assigns special importance to human remains and specifies procedures to be used when Native American remains are discovered. These procedures are detailed in PRC 5097.98 (additional detail provided under summary for California Health and Safety Code Section 7050.5, below).
- PRC Section 21083.2(b)(c) and Section 15126.4 of the CEQA Guidelines provide information regarding the mitigation framework for archaeological and historic resources, including examples of preservation-in-place mitigation measures. Preservation in place is the preferred manner of mitigating impacts to significant archaeological sites because it maintains the relationship between artifacts and the archaeological context, and may also help avoid conflict with religious or cultural values of groups associated with the archaeological site(s).

Impacts on significant cultural resources that affect the characteristics of any resource that qualify it for the NRHP or adversely alter the significance of a resource listed in or eligible for listing in the CRHR are considered a significant effect on the environment. These impacts could result from physical demolition, destruction, relocation, or alteration of the resource or its immediate surroundings such that the significance of an historical resource would be materially impaired (CEQA Guidelines Section 15064.5[b][1]). Material impairment is defined as demolition or alteration in an adverse manner [of] those characteristics of an historical resource that convey its historical significance and that justify its inclusion or eligibility for inclusion in the CRHR (CEQA Guidelines Section 15064.5[b][2][A]).

Impacts to non-unique archaeological resources are generally not considered a significant environmental impact (PRC Section 21083.2(a); CEQA Guidelines Section 15064.5(c)(4)). However, if a non-unique archaeological resource qualifies as a tribal cultural resource (PRC Sections 21074[c], 21083.2[h]), further consideration of significant impacts is required.

### **California Health and Safety Code 7050.5**

California law protects Native American burials, skeletal remains, and associated grave goods, regardless of their antiquity, and provides for the sensitive treatment and disposition of those remains. California Health and Safety Code (PRC Section 7050.5 et seq.) requires that if human remains are discovered in any place other than a dedicated cemetery, no further disturbance or excavation of the site or nearby area reasonably suspected to contain human remains shall occur until the County Coroner has examined the remains (PRC Section 7050.5b).

PRC Section 5097.98 also outlines the process to be followed in the event that remains are discovered. If the coroner determines or has reason to believe the remains are those of a Native American, the coroner must contact the NAHC within 24 hours (PRC Section 7050.5c). The NAHC will notify a Most Likely Descendant (MLD). With the permission of the landowner, the MLD may inspect the site of discovery. The inspection must be completed within 24 hours of notification of the MLD by the NAHC. The MLD may recommend means of treating or disposing of, with appropriate dignity, the human remains and items associated with Native Americans.

### **Assembly Bill 52**

California Assembly Bill 52 (AB 52) was enacted in 2015 and expands CEQA by defining a new resource category called tribal cultural resources (TCRs). AB 52 establishes “a project with an effect that may cause a substantial adverse change in the significance of a TCR is a project that may have a significant effect on the environment” (PRC Section 21084.2). It further states the lead agency shall establish measures to avoid impacts which would alter the significant characteristics of a TCR, when feasible (PRC Section 21084.3).

PRC Section 21074(a)(1)(A) and (B) defines TCRs as “sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe” and meets either of the following criteria:

1. Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources, as defined in PRC Section 5020.1(k)
2. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in PRC Section 5024.1(c).

In recognition of California Native American tribal sovereignty and the unique relationship of California local governments and public agencies with California Native American tribal governments, and to respect the interests and roles of project proponents, it is the intent AB 52 to:

1. Recognize that California Native American prehistoric, historic, archaeological, cultural, and sacred places are essential elements in tribal cultural traditions, heritages, and identities.
2. Establish a new category of resources in CEQA called “tribal cultural resources” that considers the tribal cultural values in addition to the scientific and archaeological values when determining impacts and mitigation.
3. Establish examples of mitigation measures for tribal cultural resources that uphold the existing mitigation preference for historical and archaeological resources of preservation in place, if feasible.
4. Recognize that California Native American tribes may have expertise with regard to their tribal history and practices, which concern the tribal cultural resources with which they are traditionally and culturally affiliated. Because CEQA calls for a sufficient degree of analysis, tribal knowledge about the land and tribal cultural resources at issue should be included in environmental assessments for projects that may have a significant impact on those resources.
5. In recognition of their governmental status, establish a meaningful consultation process between California Native American tribal governments and lead agencies, respecting the interests and roles of all California Native American tribes and project proponents, and the level of required confidentiality concerning tribal cultural resources, at the earliest possible point in CEQA environmental review process, so that tribal cultural resources can be identified, and culturally appropriate mitigation and mitigation monitoring programs can be considered by the decision making body of the lead agency.
6. Recognize the unique history of California Native American tribes and uphold existing rights of all California Native American tribes to participate in, and contribute their knowledge to, the environmental review process pursuant to CEQA.
7. Ensure that local and tribal governments, public agencies, and project proponents have information available, early in CEQA environmental review process, for purposes of identifying and addressing potential adverse impacts to tribal cultural resources and to reduce the potential for delay and conflicts in the environmental review process.
8. Enable California Native American tribes to manage and accept conveyances of, and act as caretakers of, tribal cultural resources.
9. Establish that a substantial adverse change to a tribal cultural resource has a significant effect on the environment.

AB 52 also establishes a formal consultation process for California tribes regarding those resources. The consultation process must be completed before a CEQA document can be certified. AB 52 requires lead agencies to “begin consultation with a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project.” Native American tribes to be included in the process are those that have requested notice of projects proposed within the jurisdiction of the lead agency.

### 4.3.3 Impact Analysis

#### a. Thresholds of Significance

The significance criteria used to evaluate the project impacts to cultural resources are based on Appendix G of the CEQA Guidelines, which states that a significant impact related to cultural resources would occur if the project would:

1. Cause a substantial adverse change in the significance of a historical resource pursuant to Section 15064.5;
2. Cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5; or
3. Disturb any human remains, including those interred outside of formal cemeteries.

#### b. Methodology

To evaluate the potential impacts of the Campus Master Plan on archaeological, historical, and tribal cultural resources, the proposed activities of the project were analyzed according to known and potential eligible resources. This analysis was completed in accordance with the provisions and requirements of federal and state laws and regulations governing the identification and management of cultural resources. The analysis of cultural resources impacts is based on substantial research presented in the Archaeological Resources Technical Report (Appendix E) and HRSR (Appendix F) prepared for the project.

#### c. Project Impact Analysis

<b>Threshold 1:</b> Would the project cause a substantial adverse change in the significance of a historical resource pursuant to Section 15064.5?
--

**Impact CUL-1** THE CAMPUS MASTER PLAN WOULD ADVERSELY AFFECT HISTORICAL RESOURCES THROUGH THE FULL AND PARTIAL DEMOLITION OF HISTORICAL RESOURCES, RENOVATION/REHABILITATION OF HISTORICAL RESOURCES, AND NEW CONSTRUCTION ADJACENT TO HISTORICAL RESOURCES. THIS IMPACT WOULD BE SIGNIFICANT AND UNAVOIDABLE. FOLLOWING MITIGATION, IMPACTS WOULD STILL BE SIGNIFICANT AND UNAVOIDABLE.

As discussed above in Section 4.4.1, *Environmental Setting*, CSUF includes 13 known historical resources, including one historic district with five contributing buildings and eight individually eligible buildings. The Campus Master Plan proposes new campus development, facilities, housing, and upgrades to support projected population growth and to enable new and expanded program initiatives. Implementation and full build-out of the Campus Master Plan would result in:

1. Full or partial demolition/replacement of historical resources;
2. Renovations, conversion, rehabilitation, or alteration of historical resources that substantially impairs the integrity of the resources;
3. Changes to the immediate surroundings of a historical resource that materially impairs the significance of the resource (through new construction adjacent to historical resources).

Historical resources that would be impacted through implementation of the Campus Master Plan include Titan Gym, Titan Shop/Bookstore, three known historical resources that form part of the Visual Arts Complex, McCarthy Hall, and the Campus Core Historic District. Titan Gym, Titan

Shop/Bookstore and the Visual Arts complex are slated for full demolition and replacement, while McCarthy Hall is slated for upgrades and renovations. Buildings located in the Campus Core Historic District are not proposed to be altered, although construction of a new building within the boundaries of the historic district, and adjacent to other buildings, is proposed.

There are additional on-campus buildings that have not been identified as historic resources but may become eligible for historic designation during the Campus Master Plan planning period (i.e. through 2039). The age of all campus buildings is shown in Figure 4.3-1. There is the potential for new development to adversely affect additional buildings, structures, or other resources that are not identified at the present time.

In examining potential indirect impacts, the *Secretary's Standards* provide guidance recognized by CEQA as mitigating potential adverse impacts caused by a project to below the level of significance. According to the *Secretary's Standards*, new construction in or near historic properties, including districts, should be differentiated but compatible; attention should be devoted to ensuring that new construction is complementary to the historic property but does not create a false sense of history by imitating or replicating a historic building or property. The *Secretary's Standards* include setting, in terms of the character of the surrounding environment, as a character-defining feature that weighs in the analysis of a resource's retention of historic integrity.

Implementation and build-out of the Campus Master Plan could result in substantial adverse changes in the significance of historical resources as there is the potential for new development to adversely affect buildings, structures, or other resources that are known to be or could be historically significant. Campus Master Plan projects could also cause damage to or destruction of historical resources or potential historical resources that have not yet been evaluated. Therefore, impacts on historical resources would be **potentially significant**.

## Mitigation Measures

### *CUL-1 Complete Historic Resources Evaluation and Project-Specific Surveys Prior to Design Phase to Identify Historical Resources*

Before altering or otherwise affecting a building, structure, or designed landscape feature that is 45 years old or older, CSUF shall retain a historian or architectural historian who meets the Secretary of the Interior's Professional Qualifications Standards to assess and document the significance of the resource according to the criteria of the National Register of Historic Places (NRHP), California Register of Historical Resources (CRHR) and California Historical Landmarks program.

The qualified historian or architectural historian shall prepare an intensive-level historic resources evaluation. Evaluations shall consider buildings, structures, objects, sites, historic districts, and potential cultural landscapes and shall identify the character-defining features of such resources and other required information on the appropriate Department of Parks and Recreation (DPR) 523 Record Forms, which shall be appended to the evaluation.

The level of documentation for each evaluation shall comply with Public Resources Code Section 5024 and 5024.5 with respect to state-owned historical resources. For resources determined through this evaluation process to meet NRHP/CRHR and/or California Historical Landmark criteria, MM CUL-2 and MM CUL-3 shall be required as early as possible in the project planning and design phase.

If the resource was the subject of a historic resources evaluation meeting the standards of PRC Section 5024 and 5024.5 within the last five (5) years, CUL-1 shall not be required.

For buildings, structures, objects, sites, historic districts, cultural landscapes, and other resources determined through this evaluation process not to meet NRHP/CRHR and/or California Historical Landmark criteria, no further mitigation is required.

*CUL-2 Conduct Secretary's Standards Project Review and Analyze Impacts to Historical Resources*

For projects that would demolish or alter resources eligible for listing in the NRHP, CRHR, or as a California Historical Landmark, CSUF shall retain a historian or architectural historian who meets the Secretary of the Interior's Professional Qualifications Standards to review and comment upon project plans for conformance with the *Secretary's Standards* and applicable mitigation measures and/or alternatives.

The architectural historian or preservation architect shall provide input to CSUF and the project design team as early as possible to facilitate project compliance with the *Secretary's Standards*, if prudent and feasible. Preservation input will identify project options capable of complying with the *Secretary's Standards* and avoiding, lessening, or mitigating significant adverse impacts to historical resources.

*Secretary's Standards* project review shall include all project components that would result in a physical change to character-defining features, insofar as these project details are available. If project details remain conceptual at the time of project review, the memorandum shall include design recommendations drawn from the *Secretary's Standards* that would facilitate compliance with the Standards and avoid, lessen, or mitigate significant adverse impacts to historical resources.

In addition, the *Secretary's Standards* project review shall include a section assessing the potential direct and indirect impacts of the proposed project on the historical resource, whether an individual resource or historic district/cultural landscape.

For projects that do not comply with the *Secretary's Standards* and would result in a significant adverse impact to a historical resource, MM CUL-4 shall be required.

*CUL-3 PRC-Required SHPO Consultation*

For state-owned historical resources, PRC Section 5024 and 5024.5 require SHPO consultation for proposed projects that might impact historical resources eligible for the NRHP, CRHR or as a California Historical Landmarks. These sections of the PRC are designed to give SHPO the opportunity to review and comment on historical resource determinations and proposed projects that might affect such historical resources.

CSUF shall consult with SHPO regarding the potential alteration or demolition of any buildings, structures, objects, sites, historic districts, cultural landscapes, or other campus features that appear eligible for listing in the National Register of Historic Places, the California Register of Historical Resources or as California Historical Landmarks, as documented through CUL-1 or through survey or evaluation. Such consultation shall be completed pursuant to California PRC Sections 5024 and 5024.5 and related guidance published by SHPO.

Following the completion of CUL-1 and/or CUL-2 and as early as possible in the project planning phase, CSUF shall retain an architectural historian or historian meeting the Secretary of the Interior's Professional Qualifications Standards in either architectural history or historic architecture in order to assist in SHPO consultation and compile the required documentation and consultation

materials in compliance with PRC Sections 5024 and 5024.5 and related guidance published by SHPO.

This shall include a formal request for consultation, the intensive-level historic resources evaluation establishing the historic resource status of the property, DPR 523 Record Forms, the appropriate historical background documentation, and a project-specific impacts analysis prepared by the qualified historian or architectural historian.

#### *CUL-4 HABS-Like Documentation*

For projects that do not comply with the *Secretary's Standards* and would result in a significant adverse impact to a historical resource, MM CUL-4 shall be required. Prior to the commencement of construction activities, CSUF shall retain a historian or architectural historian who meets the *Secretary of the Interior's Professional Qualifications Standards* to prepare HABS-like documentation for the subject historical resources. The evaluation process shall include the development of appropriate historical background research as context for the assessment of the significance of the structure in the history of the CSU system, CSUF, and the region. The HABS-like package will document in photographs and descriptive and historic narrative the historical resources slated for modification/demolition. Documentation prepared for the package will draw upon primary- and secondary-source research and available studies previously prepared for the project.

The specifications for the HABS-like package follow:

- **Photographs:** Photographic documentation will focus on the historical resources/features slated for demolition, with overview and context photographs for the campus and adjacent setting. Photographs will be taken of the building using a professional-quality single lens reflex (SLR) digital camera with a minimum resolution of 10 megapixels. Photographs will include context views, elevations/exteriors, architectural details, overall interiors, and interior details (if warranted). Digital photographs will be provided in electronic format.
- **Descriptive and Historic Narrative:** The historian or architectural historian will prepare descriptive and historic narrative of the historical resources/features slated for demolition. Physical descriptions will detail each resource, elevation by elevation, with accompanying photographs, and information on how the resource fits within the broader campus during its period of significance. The historic narrative will include available information on the campus design, history, architect/contractor/designer as appropriate, area history, and historic context. In addition, the narrative will include a methodology section specifying the name of researcher, date of research, and sources/archives visited, as well as a bibliography. Within the written history, statements shall be footnoted as to their sources, where appropriate.
- **Historic Documentation Package Submittal:** The electronic package will be assembled by the historian or architectural historian and submitted to CSUF for review and comment. In addition, an electronic version of the HABS package will be provided to the State Office of Historic Preservation for review and comment.

Upon approval by CSUF, one hard-copy version of the historic documentation package will be prepared and deposited with the University archives, Pollak Library Special Collections.

### **Significance after Mitigation**

Implementation of Mitigation Measures CUL-1, CUL-2, CUL-3, and CUL-4 would reduce potentially significant impacts on historic resources because actions would be taken to record, evaluate, avoid,

or otherwise treat the resource appropriately, in accordance with pertinent laws and regulations. However, CEQA Guidelines Section 15126.4(b)(2) notes that in some circumstances, documentation of a historical resource shall not mitigate the effects of demolition of that resource to a less-than-significant level because the historic resources would no longer exist. Therefore, because the potential for permanent loss of a historic resource or its integrity cannot be precluded, the project's impacts on historic resources is concluded to be **significant and unavoidable**.

- Threshold 2:** Would the project cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5?
- Threshold 3:** Would the project disturb any human remains, including those interred outside of formal cemeteries?

**Impact CUL-2** NO KNOWN ARCHAEOLOGICAL RESOURCES OR HUMAN REMAINS ARE PRESENT ON THE PROJECT SITE. HOWEVER, CONSTRUCTION OF THE PROJECT WOULD INVOLVE GROUND-DISTURBING ACTIVITIES, SUCH AS GRADING AND SURFACE EXCAVATION, WITH THE POTENTIAL TO UNEARTH OR ADVERSELY IMPACT PREVIOUSLY UNIDENTIFIED ARCHAEOLOGICAL RESOURCES OR HUMAN REMAINS. THEREFORE, THE PROJECT WOULD POTENTIALLY CAUSE A SUBSTANTIAL ADVERSE CHANGE IN THE SIGNIFICANCE OF AN ARCHAEOLOGICAL RESOURCE. THIS IS A POTENTIALLY SIGNIFICANT IMPACT THAT CAN BE REDUCED TO LESS THAN SIGNIFICANT WITH MITIGATION.

A project-specific Archaeological Resources Technical Report was completed for the Campus Master Plan by Rincon Consultants, Inc., dated November 2019 (Appendix E). The analysis included in the Archaeological Resources Technical Report is based on records search of California Historical Resource Information System (CHRIS), NRHP, CRHR, California Points of Historical Interest List, the California Historical Landmarks list, the Archaeological Determinations of Eligibility list, and the California State Historic Resources Inventory list. The database review was confirmed with a pedestrian field survey completed on July 15, 2019 (Appendix F).

As stated above under Section 4.4.2.2 *Methodology* for Tribal Cultural Resources, Rincon contacted the NAHC in June 2019 to request a Sacred Lands File (SLF) search of the project site and a contact list of Native Americans who may have knowledge of cultural resources within the area. The SLF search results were negative, and Rincon sent letters to the NAHC-listed contacts and conducted follow-up calls in August 2019. No Native American contacts responded to letters or returned calls expressing any project related concerns (Appendix G). However, CSUF completed additional Native American outreach with members of the Acjachemen Nation in October 2019 by responding to their information request.

As stated in the Archaeological Resources Technical Report, the Native American outreach, and field survey identified no archaeological (prehistoric or historic) resources within the Campus Master Plan area (Appendix E). Implementation of the Campus Master Plan would entail ground-disturbing activities within the boundaries of the CSUF campus, which is fully developed. Such activities could result in unanticipated discovery of archaeological resources or human remains.

Construction activities on the CSUF campus under the Campus Master Plan, including ground clearing, grading, and excavation, could have significant impacts on previously unidentified historical and archaeological resources. The depth of excavation for projects under the Campus Master Plan are undetermined at this time, but may include subsurface work for foundations, footings, and utilities. Pre-construction reconnaissance would be needed due to the possibility for encountering subsurface archaeological resources during construction activities, including site excavation.

Previously unrecorded archaeological resources or human remains, if present within the project site, could be damaged or destroyed during ground disturbance undertaken for project implementation. Adverse physical effects to or destruction of archaeological resources or human remains would result in a significant impact.

Mitigation Measures CUL-5 and CUL-6 are provided to ensure procedures are in place to properly identify, document, and manage archaeological resources and human remains that may be discovered during ground-disturbing activities under the Campus Master Plan. Therefore, potential project impacts to previously unknown archaeological resources and human remains, if encountered, would be reduced to less than significant with mitigation incorporated.

## Mitigation Measures

### *CUL-5 Discovery of Unknown Resources*

In the event that cultural resources of Native American origin are identified during construction, all earth-disturbing work in the vicinity of the find shall be temporarily suspended or redirected until an archaeologist meeting the Secretary of the Interior's Professional Qualifications Standards (NPS 1983) has evaluated the nature and significance of the find and an appropriate Native American representative, based on the nature of the find, is consulted. If CSUF determines that the resource is a tribal cultural resource and thus significant under CEQA, a mitigation plan shall be prepared and implemented in accordance with state guidelines and in consultation with Native American groups. The plan shall include avoidance of the resource or, if avoidance of the resource is infeasible, the plan shall outline the appropriate treatment and data recovery plan in coordination with the archeologist and the appropriate Native American tribal representative. The Native American monitor and consulting tribe(s) will be provided an opportunity to participate in the documentation and evaluation of the find. If a data recovery plan and treatment of the unanticipated discovery is required, then the consulting tribe(s) will be provided an opportunity to review and provide input on the plan and treatment.

### *CUL-6 Discovery of Unknown Human Remains*

The discovery of human remains is always a possibility during ground disturbing activities. If human remains are found, the State of California Health and Safety Code Section 7050.5 states that no further disturbance shall occur until the County coroner has made a determination of origin and disposition pursuant to PRC Section 5097.98. In the event of an unanticipated discovery of human remains, the County coroner must be notified immediately. If the human remains are determined to be prehistoric, the coroner shall notify the NAHC, which will determine and notify a MLD. The MLD shall complete the inspection of the site within 48 hours of being granted site access and may recommend scientific removal, and nondestructive analysis of human remains and items associated with Native American burials, pursuant to Mitigation Measure CUL-5.

## Significance After Mitigation

Mitigation Measures CUL-5 and CUL-6 ensure construction and ground-disturbing activities would halt in the event previously unknown cultural resources or human remains are unearthed, and such resources would be properly identified and managed. Therefore, project impacts to cultural resources and human remains would be less than significant with implementation of Mitigation Measures CUL-5 and CUL-6.

### *Tribal Cultural Resources*

#### **a. Thresholds of Significance**

The significance criteria used to evaluate the project impacts to tribal cultural resources are based on Appendix G of the CEQA Guidelines. A significant impact related to tribal cultural resources would occur if the project would cause a substantial adverse change in the significance of a tribal cultural resource, defined in PRC Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

1. Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in PRC Section 5020.1(k), or
2. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in PRC Section 5024.1(c). In applying the criteria set forth in PRC Section 5024.1(c), the lead agency shall consider the significance of the resource to a California Native American tribe.

#### **b. Methodology**

Potential impacts on tribal cultural resources are analyzed based on the potential for the project to impact any tribal cultural resources during construction or operation. The significance of a tribal cultural resource and subsequent significance of any impact is determined by, among other things, consideration of whether or not that resource has heritage value to California Native Americans.

Rincon contacted the NAHC on June 21, 2019 to request a SLF search of the project site and a contact list of Native Americans who may have knowledge of cultural resources within the area. The NAHC responded on July 5, 2019, stating that the results of the SLF search were negative. Rincon sent letters to the NAHC-listed contacts and conducted follow-up calls on August 12, 2019. At the request of CSUF, Rincon also emailed Jacque Nunez of the Acjachemen Nation on October 16, 2019, to request information on Native American resources within the project vicinity. No contacts responded to letters or returned calls expressing any project related concerns (Appendix G).

In August 2019, CSUF, as the Lead Agency for this project, initiated formal government-to-government consultation with interested Native American groups in accordance with AB 52. Copies of the Native American outreach correspondence (AB 52 consultation request letters with project information and site map) are provided in Appendix G. Of the six tribal contacts from the Gabrieleño/Tongva Nation who were sent AB 52 consultation notifications, two requests for further consultation were received. CSUF representatives communicated with these two contacts via email, and hosted a consultation meeting with one of the contacts in November 2019. Tribal consultation between the two tribes and CSUF concluded in January 2020 (Appendix G).

CSUF completed additional Native American outreach with Ms. Joyce Stanfield and Ms. Jacque Nunez of the Acjachemen Nation in October 2019, based on their information request on Native American resources within the project vicinity.

### c. Project Impact Analysis

**Threshold 1 & 2:** Would the project cause a substantial adverse change in the significance of a tribal cultural resource, defined in Public Resources Code Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe, and that is:

- a. Listed or eligible for listing in the California Register of Historical Resources, or in a local register of historical resources as defined in PRC Section 5020.1(k)?, or
- b. A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in PRC Section 5024.1(c). In applying the criteria set forth in PRC Section 5024.1(c), the lead agency shall consider the significance of the resource to a California Native American tribe?

**Impact TCR-1** IMPLEMENTATION OF THE PROJECT WOULD INVOLVE GROUND-DISTURBING ACTIVITIES SUCH AS GRADING AND SURFACE EXCAVATION, WITH THE POTENTIAL TO UNEARTH OR ADVERSELY IMPACT PREVIOUSLY UNIDENTIFIED TRIBAL CULTURAL RESOURCES. NO KNOWN TRIBAL CULTURAL RESOURCES ARE PRESENT ON THE PROJECT SITE. THIS IS A POTENTIALLY SIGNIFICANT IMPACT THAT CAN BE REDUCED TO LESS THAN SIGNIFICANT WITH MITIGATION.

---

As stated above in the Methodology discussion for Section 4.4.2.2, *Tribal Cultural Resources*, of this Draft EIR, no tribal cultural resources were identified in the project area based on a SLF search (Appendix G). CSUF, as Lead Agency, prepared and mailed letters to local California Native Americans in accordance with AB 52 (Appendix G). No tribal cultural resources have been identified from AB 52 consultation efforts and the area of disturbance for the proposed project is not known or expected to contain any tribal cultural resources that would qualify as a historical resource or a unique cultural resource as defined in PRC Section 5020.1(k) or a resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in PRC Section 5024.1(c).

However, ground-disturbing activities associated with projects under the Campus Master Plan could expose previously undiscovered subsurface archaeological resources that may be considered tribal cultural resources and could be adversely affected by the project construction. Such an impact would be considered potentially significant. CSUF and the consulting tribes agreed that, in the event of the discovery of previously unknown cultural resources of tribal or Native American importance during construction activities, Mitigation Measures CUL-5 and CUL-6 would be implemented to reduce potential project impacts to less than significant levels. Therefore, potential project impacts to previously unknown tribal cultural resources and human remains, if encountered, would be reduced to less than significant with mitigation incorporated.

### Mitigation Measures

Mitigation Measures CUL-5 and CUL-6, as stated above, are required.

## Significance After Mitigation

Mitigation Measures CUL-5 and CUL-6 ensure construction and ground-disturbing activities would halt in the event previously unknown cultural resources or human remains are unearthed, and such resources would be properly identified and managed. Therefore, project impacts to cultural resources and human remains would be less than significant with implementation of Mitigation Measures CUL-5 and CUL-6.

## 4.4 Energy

---

This section analyzes the energy impacts of constructing and operating the proposed Campus Master Plan. This analysis is based on Appendix G, Environmental Checklist Form, of the CEQA Guidelines. To assure project decisions consider energy implications, CEQA requires that impact analysis include a discussion of the potential energy impacts of proposed projects, with particular emphasis on avoiding or reducing inefficient, wasteful, and unnecessary consumption of energy.

### 4.4.1 Environmental Setting

#### a. Existing Energy Setting

Energy use can affect air quality and other natural resources adversely. Energy is primarily categorized in three areas: electricity, used in buildings and cities for lighting and other services; natural gas used for building heating, cooking, and other industrial processes; and fuels used for transportation. Fossil fuels used for any of these types of energy must be burned to create electricity that powers homes and commercial/industrial buildings, to create heat, and to power vehicles. The burning or combusting of fuels releases pollutants and GHG emissions. Many factors affect the level of impact from fuels. When used in transportation, the impact from energy corresponds to the fuel efficiency of cars, trucks, and public transportation; the mode of travel, such as auto, carpool, and public transit; and miles traveled by these modes as well as the type of fuel. Construction and the routine operation and maintenance of transportation infrastructure also consumes energy as do residential, commercial, and industrial land uses. This typically occurs through the use of natural gas for heating, cooking, and industrial processes along with the use of electricity.

#### Energy Consumption and Sources

Total energy consumption in the U.S. in 2018 was approximately 101.2 quadrillion British thermal units (Btu) (Energy Information Administration [EIA] 2019). Of this, fossil fuels provided approximately 80 percent (EIA 2019a). Petroleum constituted approximately 37 percent, natural gas approximately 31 percent, coal approximately 13 percent, total renewable sources approximately 11 percent, and nuclear electric power approximately 8 percent of energy consumed in the U.S. in 2018 (EIA 2019a). On a per capita basis in 2016, California was ranked the fourth lowest state in terms of energy use (199 million Btu [MBtu] per person), or about 58 percent less than the U.S. average per capita consumption of 344.7 MBtu per person (EIA 2018a). This is attributed to mild weather throughout the state, vehicle fuel efficiency standards, and green building policies.

#### Energy Supply

The two largest sources of energy produced in California in 2017 were renewable energy sources, at approximately 1,086 trillion Btu and crude oil, at approximately 996 trillion Btu (EIA 2017). Crude oil was used as transportation fuel primarily, with a portion used in industrial processes. In this analysis, renewable energy sources include geothermal, solar, wind, biomass, and hydroelectric energy generation. Other sources of energy produced in California include nuclear electric power, natural gas, and biofuels (EIA 2017).

*Electricity*

In 2017, California’s total electric generation was 292,039 Gigawatt hours (GWh), of which 206,336 GWh was produced in-state (CEC 2018a). California’s non-CO<sub>2</sub> emitting electric generation sources accounted for more than 56 percent of the total in-State generation, which was up from 50 percent in 2016. Orange County, where the proposed project is located, consumed approximately 20,061.7 GWh of electricity (CEC 2017). Table 4.4-1 indicates that Orange County accounted for approximately seven percent of the state’s electricity generation in 2017 and had a per capita electricity consumption of approximately 6,296.9 kilowatt-hours (kWh).

**Table 4.4-1 2017 Orange County Electricity Consumption**

<b>County Consumption (GWh)<sup>1</sup></b>	<b>Percent of Statewide Generation</b>	<b>County Per Capita Consumption (kWh)<sup>1</sup></b>
20,061.7	7	6,296.9

<sup>1</sup> Electricity consumption is quantified in GWh, while per capita electricity is quantified in kWh.

Sources: CEC 2018b; U.S. Census Bureau 2018

Southern California Edison (SCE) supplies electricity to CSUF. SCE serves approximately 15 million people in a 50,000 square-mile area of central, coastal, and southern California (SCE 2019). SCE owns and operates 118,000 miles of distribution and transmission lines and 1.4 million power poles in order to serve its customers and service areas (SCE 2019). In Table 4.4-2 below, the breakdown energy consumption in SCE by sector shows that commercial and residential uses constitute the greatest users of energy.

**Table 4.4-2 Electricity Consumption in the SCE Service Area in 2018**

<b>Agriculture and Water Pump</b>	<b>Commercial Building</b>	<b>Commercial Other</b>	<b>Industry</b>	<b>Mining and Construction</b>	<b>Residential</b>	<b>Streetlight</b>	<b>Total Usage</b>
3,150.9	31,165.5	4,310.9	13,218.5	2,359.1	28,617.1	578.0	83,400.0

Notes: All usage expressed in GWh

Source: CEC 2018d

As shown in Table 4.4-2, SCE provided approximately 83,400 GWh, or 83.4 billion kWh, of electricity in 2018. SCE receives its electricity from a number of sources. According to the 2017 Power Content Label, which discloses power sources from retail electricity suppliers, SCE receives its energy from renewables, hydroelectric, natural gas, nuclear, and unspecified sources (CEC 2018c). Table 4.4-3 shows the breakdown of energy resources from SCE compared to California’s breakdown of energy sources in 2017. SCE has more renewable energy sources overall compared to California and is dedicated to increasing its renewable energy portfolio into the future. SCE seeks to increase its renewable energy and carbon free energy sources to 80 percent by 2030 (SCE 2017).

Table 4.4-3 SCE 2017 Power Content Mix

Energy Resources	Power Mix	2017 CA Power Mix**
<b>Eligible Renewable</b>	<b>32%</b>	<b>29%</b>
Biomass & biowaste	0%	2%
Geothermal	8%	4%
Eligible hydroelectric	1%	3%
Solar	13%	10%
Wind	10%	10%
Coal	0%	4%
Large Hydroelectric	8%	15%
Natural Gas	20%	34%
Nuclear	6%	9%
Other	0%	<1%
Unspecified sources of power*	34%	9%
<b>Total</b>	<b>100%</b>	<b>100%</b>

\* "Unspecified sources of power" means electricity from transactions that are not traceable to specific generation sources.

\*\* Percentages are estimated annually by the California Energy Commission based on the electricity sold to California consumers during the identified year.

Source: CEC 2018c

### Natural Gas

Natural gas forms a third of energy commodities consumed in California and consumers fall into four sectors: residential, commercial, industrial, and electric power generation. By sector, industrial uses consumed approximately 38 percent of the California's natural gas, followed by approximately 28 percent from electric power generation, approximately 20 percent from residential uses, approximately 11 percent from commercial uses, and approximately 2 percent from transportation uses (EIA 2017).

In 2018, California also consumed about 12,666 million U.S. therms (MMthm), or about 1,177 trillion Btu, of natural gas in 2018 (CEC 2018e). Orange County consumed approximately 575 million MMthm of natural gas in the same year, which accounted for 4.5 percent of the statewide consumption, as detailed in Table 4.4-4.

Table 4.4-4 2018 Orange County Natural Gas Consumption

County Consumption (MMThm) <sup>1</sup>	Percent of Statewide Consumption	County per Capita Consumption (thm) <sup>2</sup>
575.1	4.5	180.5

<sup>1</sup> Natural gas consumption is quantified in million therms (MMThm)

<sup>2</sup> Per capita natural gas consumption is quantified in therms (thm)

Sources: CEC 2018d; U.S. Census Bureau 2018

Southern California Gas Company (SCG) provides natural gas service to CSUF. SCG is the principal distributor of natural gas in Southern California and provides natural gas for residential, commercial, and industrial markets, as well as for electric generation (California Gas and Electric Utilities 2018).

SCG currently projects gas demands in all of its market sectors to decrease at an annual average rate of approximately 0.7 percent from 2018 to 2035 (California Gas and Electric Utilities 2018). This is

due to modest economic growth, California Public Utilities Commission (CPUC)-mandated energy efficiency standards and programs, stricter standards through Title 24 Codes, renewable energy goals, and a decline in commercial and industrial demand (California Gas and Electric Utilities 2018). Table 4.4-5 shows the natural gas consumption by sector in the SCG service area. In 2018, SCG distributed approximately 5,156 MBtu, or 5.1 billion Btu, of which residential and industry sectors constituted the greatest demand.

**Table 4.4-5 Natural Gas Consumption in SCG Service Area in 2018**

Agriculture and Water Pump	Commercial Building	Commercial Other	Industry	Mining and Construction	Residential	Total Usage
77.6	913.0	74.5	1,714.4	229.2	2,147.4	5,156.1

Notes: All usage expressed in MBtu

Source: CEC 2018f

### *Petroleum*

Petroleum products consumed by the transportation sector in California accounted for roughly 85 percent of California’s total petroleum demand in 2017, or approximately 3,124 trillion Btu (EIA 2019b). In 2017, approximately 40 percent of the state’s energy consumption was used for transportation activities (EIA 2018b). Most gasoline and diesel fuel sold in California for motor vehicles is refined in California to meet state-specific formulations required by CARB. California’s transportation sector, including on-road and rail transportation, consumed roughly 682 million barrels of petroleum fuels in 2017 (EIA 2019b). The TIS (Appendix M) estimated the project would result in 14 daily VMT or 30,922,635 annual VMT.

### *Alternative Vehicle Fuels*

Various statewide regulations and plans encourage alternative fuel use to reduce GHG emissions and criteria pollutant emissions. These include the Low Carbon Fuel Standard and SB 32, as well as myriad other statewide and local air district regulations. Conventional gasoline and diesel may be replaced with different alternative fuels, depending on the capability of the vehicle. Descriptions of the most widely used alternative fuels include the following:

- **Hydrogen** is being explored for use in combustion engines and fuel cell electric vehicles. The interest in hydrogen as an alternative transportation fuel stems from its clean-burning qualities, its potential for domestic production, and the fuel cell vehicle's potential for high efficiency: hydrogen is two to three times more efficient than gasoline. Currently, California has 34 hydrogen refueling stations, and closet to the project site is in Anaheim at 3731 E. La Palma Avenue (U.S. Department of Energy [DOE] 2019). Fuel cells are being explored as a way to use electricity generated on-board the vehicle to power electric motors.
- **Biodiesel** is a renewable alternative fuel that can be manufactured from vegetable oils, animal fats, or recycled restaurant grease. Biodiesel is biodegradable and cleaner-burning than petroleum-based diesel fuel. Generally, biodiesel can run in any diesel engine without alterations, but fueling stations have been slow to make it available. There are eleven biodiesel refueling stations in California, but none in the City of Fullerton or in Orange County (DOE 2019).
- **Electricity** can power electric and plug-in hybrid electric vehicles directly from the power grid. Generally, these vehicles draw from the electricity grid and store the energy in their batteries. CSUF currently has 37 electric vehicle charging stations on campus (CSUF 2019d).

- **Natural Gas** is currently being used in vehicles in two forms: compressed natural gas and liquefied natural gas. Compressed natural gas is used in light-, medium, and heavy-duty vehicles and gets about the same fuel economy. Liquefied natural gas is costly to produce and therefore is used in limited applications, typically in medium- and heavy-duty vehicles (DOE 2018).

### *Energy and Fuel Efficiency*

Though the demand for gasoline and diesel fuel continues to increase, it can be offset partially by efficiency improvements. Land use policies, such as SB 375, encourage infill and growth near transit centers, improvements to fuel efficiency, and replacement of older vehicles with more energy-efficient newer ones all of which will contribute to reduced fuel demand.

## 4.4.2 Regulatory Setting

Programs and policies at the federal, state, and local levels have emerged to bolster the previous trend towards energy efficiency; these are discussed in what follows.

### **Federal**

#### *Energy Policy and Conservation Act*

Enacted in 1975, this legislation established fuel economy standards for new light-duty vehicles (autos, pickups, vans, and sport-utility vehicles). The law placed responsibility on the National Highway Traffic and Safety Administration, a part of the U.S. Department of Transportation, for establishing and regularly updating vehicle standards. The U.S. Environmental Protection Agency (USEPA) administers the Corporate Average Fuel Economy program, which determines vehicle manufacturers' compliance with existing fuel economy standards. Since the inception of the program, the average fuel economy for new light-duty vehicles steadily increased from 13.1 miles per gallon (mpg) for the 1975 model year to 30.7 mpg for the 2014 model year and can increase to 54.5 by 2025.

#### *Energy Star Program*

In 1992, the USEPA introduced Energy Star as a voluntary labeling program to identify and promote energy-efficient products to reduce GHG emissions. The program applies to major household appliances, lighting, computers, and building components, such as windows, doors, roofs, and heating and cooling systems. Under this program, appliances that meet specification for maximum energy use established under the program are certified to display the Energy Star label. In 1996, the USEPA joined with the Energy Department to expand the program, which now includes qualifying commercial and industrial buildings as well as homes.

#### *Energy Independence and Security Act of 2007*

The Energy Independence and Security Act of 2007 was designed to improve vehicle fuel economy and help reduce nationwide dependence on foreign oil. It expands the production of renewable fuels, reducing dependence on oil, and confronting global climate change. Specifically, it increases the supply of alternative fuel sources by setting a mandatory Renewable Fuel Standard by requiring fuel producers to use at least 36 billion gallons of biofuel in 2022 and reduces U.S. demand for oil by setting a national fuel economy standard of 35 miles per gallon by 2020.

### *Executive Order 13693*

In March 2015, EO 13693 *Planning for Federal Sustainability in the Next Decade* was signed into action. The goal of this EO is to expand on the Energy Independence and Security Act of 2007 and maintain federal leadership in sustainability and GHG emission reductions. The EO includes the following goals related to energy:

- 25 percent reduction in energy use intensity (2015 baseline).
- 30 percent of electricity supply from renewable energy by 2025.
- 25 percent of total building energy (electric and alternative energy) from renewable energy by 2025.
- 30 percent reduction of GHG emissions per miles by fiscal year 2025 (compared to 2014 fiscal year baseline).
- Achieve energy net zero by fiscal year 2030 on all federal buildings planned after the 2020 fiscal year

## **State**

### *California Energy Action Plan*

The CEC, in collaboration with CPUC, is responsible for preparing the California Energy Action Plan (EAP), which identifies emerging trends related to energy supply, demand, conservation, public health and safety, and the maintenance of a healthy economy. The 2003 EAP calls for the state to assist in the transformation of the transportation system to improve air quality, reduce congestion, and increase the efficient use of fuel supplies with the least environmental and energy costs. To further this policy, the plan identifies a number of strategies, including assistance to public agencies and fleet operators in implementing incentive programs for zero-emission vehicles and addressing their infrastructure needs; and encouragement of urban designs that reduce VMT and accommodate pedestrian and bicycle access.

In the October 2005 Energy Action Plan II (EAP II), the CEC and CPUC updated their energy policy vision by adding some important dimensions to the policy areas included in the original EAP, such as information on the emerging importance of climate change, transportation-related energy issues, and research and development activities. The CEC adopted an update to the EAP II in February 2008 that supplements the earlier EAPs and examines the state's ongoing actions in the context of global climate change. In 2008, the CEC determined an update to the plan was not needed due to state regulations such as AB 32, the California Global Warming Solutions Act.

### *California Energy Code*

The Building Energy Efficiency Standards were first adopted in 1976 and have been updated periodically since then. The standards contain energy and water efficiency requirements (and indoor air quality requirements) for newly constructed buildings, additions to existing buildings, and alterations to existing buildings. The goal is to reduce energy costs for owners, increase reliability and availability of electricity for the state, improve building occupant comfort, and reduce environmental impact.

### *Assembly Bill 2076: Reducing Dependence on Petroleum*

Pursuant to AB 2076 (Chapter 936, Statutes of 2000), the CEC and CARB prepared and adopted a joint-agency report, *Reducing California's Petroleum Dependence*. Included in this report are recommendations to increase the use of alternative fuels to 20 percent of on-road transportation fuel use by 2020 and 30 percent by 2030, significantly increase the efficiency of motor vehicles, and reduce per capita VMT. One performance-based goal for AB 2076 is to reduce petroleum demand to 15 percent below 2003 demand. Furthermore, in response to the CEC's 2003 and 2005 Integrated Energy Policy Reports, the Governor directed the CEC to take the lead in developing a long-term plan to increase alternative fuel use.

### *Integrated Energy Policy Report*

SB 1389 (Chapter 568, Statutes of 2002) required the CEC to conduct assessments and forecasts of all aspects of energy industry supply, production, transportation, delivery and distribution, demand, and prices. The CEC uses these assessments and forecasts to develop energy policies and recommendations to conserve resources, protect the environment, ensure energy reliability, enhance the State's economy, and protect public health and safety.

### *Senate Bill X1-2: California Renewable Energy Resources Act*

In 2011, the Governor signed SB X1-2, which requires retail sellers of electricity, including investor-owned utilities and community choice aggregators, to provide at least 33 percent of their electricity supply from renewable sources by 2020. The CPUC and CEC implement the statewide Renewable Portfolio Standard (RPS) program through rulemakings and monitoring the activities of electric energy utilities in the State.

### *Senate Bill 1078: California Renewables Portfolio Standard Program*

SB 1078 (Chapter 516, Statutes of 2002), and as expanded under SB X1-2, establishes an RPS for electricity supply. The initial RPS program only required electrical corporations to provide 20 percent of their supply from renewable sources by increasing its total procurement at least one percent each year to reach the 20 percent goal. SB X1-2 expanded this law by making it applicable to all retail sellers of electricity and required procurement from eligible renewable energy resources to 33 percent by 2020.

### *Senate Bill 350: Clean Energy and Pollution Reduction Act of 2015*

The Clean Energy and Pollution Reduction Act of 2015 (SB 350) requires the amount of electricity generated and sold to retail customers per year from eligible renewable energy resources to be increased to 50 percent by December 31, 2030. This act also requires doubling of the energy efficiency savings in electricity and natural gas for retail customers through energy efficiency and conservation by December 31, 2030.

### *Senate Bill 100*

Adopted on September 10, 2018, SB 100 supports the reduction of GHG emissions from the electricity sector by accelerating the state's RPS Program, which was last updated by SB 350 in 2015. SB 100 requires electricity providers to increase procurement from eligible renewable energy resources to 33 percent of total retail sales by 2020, 44 percent by 2024, 60 percent by 2030, and 100 percent by 2045.

*Assembly Bill 1493: Reduction of Greenhouse Gas Emissions*

AB 1493 (Chapter 200, Statutes of 2002), known as the Pavley Bill, amended Health and Safety Code Sections 42823 and added 43018.5 requiring CARB to develop and adopt regulations that achieve maximum feasible and cost-effective reduction of GHG emissions from passenger vehicles, light-duty trucks, and other vehicles used for noncommercial personal transportation in California.

*Assembly Bill 1007: State Alternative Fuels Plan*

AB 1007 (Chapter 371, Statutes of 2005) required the CEC to prepare a state plan to increase the use of alternative fuels in California. The CEC prepared the State Alternative Fuels Plan (SAF Plan) in partnership with CARB and in consultation with other federal, state, and local agencies. The SAF Plan presents strategies and actions California must take to increase the use of alternative non-petroleum fuels in a manner that minimizes costs to California and maximizes the economic benefits of in-state production. The SAF Plan assessed various alternative fuels and developed fuel portfolios to meet California's goals to reduce petroleum consumption, increase alternative fuels use, reduce GHG emissions, and increase in-state production of biofuels without causing a significant degradation of public health and environmental quality.

*Bioenergy Action Plan, Executive Order S-06-06*

EO S-06-06, April 25, 2006, establishes targets for the use and production of biofuels and biopower, and directs State agencies to work together to advance biomass programs in California, while providing environmental protection and mitigation. The EO establishes the following target to increase the production and use of bioenergy, including ethanol and biodiesel fuels made from renewable resources: produce a minimum of 20 percent of its biofuels in California by 2010, 40 percent by 2020, and 75 percent by 2050. EO S-06-06 also calls for the state to meet a target for use of biomass electricity. The 2011 Bioenergy Action Plan identifies those barriers and recommends actions to address them so that the State can meet its clean energy, waste reduction, and climate protection goals. The 2012 Bioenergy Action Plan updates the 2011 Plan and provides a more detailed action plan to achieve the following goals:

- Increase environmentally and economically sustainable energy production from organic waste
- Encourage development of diverse bioenergy technologies that increase local electricity generation, combined heat and power facilities, renewable natural gas, and renewable liquid fuels for transportation and fuel cell applications
- Create jobs and stimulate economic development, especially in rural regions of the State
- Reduce fire danger, improve air and water quality, and reduce waste

*Title 24, California Code of Regulations*

California Code of Regulations, Title 24, Part 6, is California's Energy Efficiency Standards for Residential and Non-residential Buildings. The CEC established Title 24 in 1978 in response to a legislative mandate to create uniform building codes to reduce California's energy consumption and provide energy efficiency standards for residential and nonresidential buildings. The standards are updated on an approximately three-year cycle to allow consideration and possible incorporation of new efficient technologies and methods.

In 2016, the CEC updated Title 24 standards with more stringent requirements effective January 1, 2017. All buildings for which an application for a building permit is submitted on or after January 1, 2017 must follow the 2016 standards. Energy efficient buildings require less electricity;

therefore, increased energy efficiency reduces fossil fuel consumption and decreases GHG emissions. The building efficiency standards are enforced through the local plan check and building permit process. Local government agencies may adopt and enforce additional energy standards for new buildings as reasonably necessary due to local climatologic, geologic, or topographic conditions, provided these standards exceed those provided in Title 24.

*California Green Building Standards Code (2016), California Code of Regulations  
Title 24, Part 11*

California's green building code, referred to as CalGreen, was developed to reduce GHG emissions from buildings, promote environmentally responsible, cost-effective, healthier places to live and work, reduce energy and water consumption, and respond to the environmental directives of the administration. The most recent version of CalGreen (January 2019) lays out the minimum requirements for newly constructed residential and nonresidential buildings to reduce GHG emissions through improved efficiency and process improvements. It also includes voluntary tiers to encourage building practices that improve public health, safety, and general welfare by promoting a more sustainable design. If the project is submitted for building plan check on January 1, 2020 or after, the 2019 code cycle will be effective.

*California Air Resources Board*

CARB has a number of regulations and standards that seek to limit emissions from mobile sources and pollution from specific types of operation or source pollution. These policies indirectly impact energy consumption. These include:

- In-Use Off-Road Diesel Rule: Imposes limits on idling, restricts the addition of older vehicles, and requires the retirement or replacement of older engines depending on their fleet size category.
- Phase 1 Medium- and Heavy-Duty Engine and Vehicle GHG Emission Standards: establishes standards for new medium- and heavy-duty engines and vehicles sold in California.
- Advanced Clean Cars Plan: Coordinates regulating smog-causing pollutants and GHG emissions through developing more stringent emissions standards for vehicles and improving the number of zero-emission vehicles on the roadways.

*California State University Sustainability Policy*

CSU's Sustainability Policy was updated in 2014 to further the system's energy conservation and other sustainability measures goals (CSU 2014). The following measures most applicable to energy reductions are:

- **Climate Action Plan**
  - The CSU will encourage and promote the use of alternative transportation and/or alternative fuels to reduce GHG emissions related to university associated transportation, including commuter and business travel.
- **Energy Independence and Procurement**
  - The CSU shall pursue energy procurement and production to reduce energy capacity requirements from fossil fuels and promote energy independence using available economically feasible technology for on-site and/or renewable generation.
  - The CSU will endeavor to exceed the State of California and California Public Utilities Commission RPS sooner than the established goal of procuring 33 percent of its electricity needs from renewable sources by 2020.

▪ **Energy Conservation and Utility Management**

- All CSU buildings and facilities, regardless of the source of funding for their operation, will be operated in the most energy efficient manner without endangering public health and safety and without diminishing the quality of education and the academic program.
- All CSU campuses will continue to identify energy efficiency improvement measures to the greatest extent possible, undertake steps to seek funding for their implementation and, upon securing available funds, expeditiously implement the measures.
- The CSU will cooperate with federal, state, and local governments and other appropriate organizations in accomplishing energy conservation and utilities management objectives throughout the state; and inform students, faculty, staff and the general public of the need for and methods of energy conservation and utilities management.
- The CSU will monitor monthly energy and utility usage on all campuses and the Chancellor's Office and will prepare a systemwide annual report on energy utilization and greenhouse gas emissions. The Chancellor's Office will maintain a systemwide energy database in which monthly campus data will be compiled to produce systemwide energy reporting. Campuses will provide the Chancellor's Office the necessary energy and utility data, such as electricity and natural gas consumption; water and sewer usage; fuel consumed by fleet vehicles, boats, and ships; waste disposal for the systemwide database in a timely manner.
- Each CSU campus is encouraged to develop and maintain a campus-wide integrated strategic energy resource plan, which will include tactical recommendations in the areas of new construction, deferred maintenance, facility renewal, energy projects, water conservation, solid waste management, and an energy management plan. This plan will guide the overall energy program at each campus.

▪ **Water Conservation**

- All CSU campuses will pursue water resource conservation to reduce water consumption by 10 percent by 2016, and 20 percent by 2020 including such steps to develop sustainable landscaping, install controls to optimize irrigation water use, reduce water usage in restrooms and showers, and promote the use of reclaimed/recycled water.

▪ **Sustainable Building Practices**

- All future CSU new construction, remodeling, renovation, and repair projects will be designed with consideration of optimum energy utilization, low life cycle operating costs, compliance with all applicable energy codes (enhanced Title 24 energy codes) and regulations. In the areas of specialized construction that are not regulated through the current energy codes, such as historical buildings, museums, and auditoriums, the CSU will ensure that these facilities are designed to consider energy efficiency. Energy efficient and sustainable design features in the project plans and specifications will be considered in balance with the academic program needs of the project within the available project budget.
- Capital Planning, Design and Construction in the Chancellor's Office shall monitor building sustainability/energy performance and maintain information on design best practices to support the energy efficiency goals and guidelines of this policy. The sustainability performance shall be based on LEED principles with consideration to the physical diversity and microclimates within the CSU.
- The CSU shall design and build all new buildings and major renovations to meet or exceed the minimum requirements equivalent to LEED "Silver." Each campus shall strive to achieve

a higher standard equivalent to LEED “Gold” or “Platinum” within project budget constraints. Each campus may pursue external certification through the LEED process.

▪ **Physical Plant Management**

- Each campus shall operate and maintain a comprehensive energy management system that will provide centralized reporting and control of the campus energy related activities.
- To the extent possible, academic and non-academic programs will be consolidated in a manner to achieve the highest building utilization.
- All CSU campuses will implement a utilities chargeback system to recover direct and indirect costs of utilities provided to self-supporting and external organizations pursuant to procedures in the Integrated California State University Administrative Manual (ICSUAM).

*Energy Use Index*

Energy use is the primary metric used by the CSU to track progress toward energy conservation goals, referred to as the Energy Use Index (EUI). EUI represents total annual electricity and natural gas use per square foot of building space, measured in Btus per square foot. To normalize this metric between different CSU campuses, the square footage is adjusted to prorate or remove buildings and structures that are very low or zero energy users, such as parking structures, stadiums, and farm buildings such as barns and storage sheds. The last two CSU EOs on energy and sustainability (i.e., 917 of 2004, 987 of 2006) established goals to reduce Btus per square foot by 15 percent over two consecutive five-year periods.

*Executive Order 987*

Executive Order 987 is the CSU Policy Statement on Energy Conservation, Sustainable Building Practices, and Physical Plant Management. All CSU’s operate under this Executive Order, which sets minimum efficiency standards for new construction and renovations, and establishes operating practices intended to ensure buildings are used in the most energy efficient and sustainable manner possible while still meeting the programmatic needs of the university.

**Local**

CSUF, as a state entity, is not subject to municipal regulations of local governments for uses on property owned or controlled by CSUF that are in furtherance of the University’s education purposes. However, CSUF may consider, for coordination purposes, aspects of local plans and policies for the communities surrounding the campus when it is appropriate and feasible, but it is not bound by those plans and policies in its planning efforts. Therefore, this EIR considers City of Fullerton plans and policies for informational purposes only.

*The Fullerton Plan*

The Fullerton Plan (2012a), specifically the Air Quality and Climate Change Element, recognizes the importance of achieving the regional air quality objectives. The General Plan seeks to protect the well-being of citizens within the City of Fullerton through improvement of air quality. The City of Fullerton does not have jurisdiction over CSUF; however, CSUF considers aspects of local plans and policies for the communities surrounding the campus when it is appropriate and feasible, although it is not bound by those plans and policies in its planning efforts. The Fullerton Plan includes the following goals and policies that apply to the project:

**Goal 5:** A balanced system promoting transportation alternatives that enable mobility and an enhanced quality of life.

**Policy 5.9:** Support projects, programs, policies and regulations to improve – in coordination with the school districts – alternatives to the motorized transport of students by parents to and from school.

**Policy 5.16:** Support projects, programs, policies and regulations to encourage the development of private and/or public infrastructure facilitating the use of alternative fuel vehicles.

**Goal 6:** A bicycle-friendly city where bicycling is a safe and convenient alternative to motorized transportation and a recreational opportunity for people of all ages and abilities.

**Policy 6.5:** Support projects, programs, policies and regulations that make bicycling safer and more convenient for all types of bicyclists.

**Goal 22:** Participation in regional efforts to address climate change and its local impact.

**Policy 22.2:** Support regional and subregional efforts to reduce greenhouse gas emissions associated with electrical generation through energy conservation strategies and alternative/renewable energy programs.

**Policy 22.4:** Support regional and subregional efforts to reduce emissions associated with solid waste through increased recycling programs and reduced waste strategies.

#### *City of Fullerton Climate Action Plan*

The City, as part of The Fullerton Plan, prepared a Climate Action Plan (CAP) (Fullerton 2012b). The purpose of the CAP is to address the main sources of emissions that contribute to global climate change. The CAP includes strategies to reduce GHG emissions, which include measures to conserve energy use in the City. The four reduction strategies are as follows:

- **Transportation and Mobility Strategy:** Promote a balanced transportation system that promotes the use of public transportation and bicycles, reduces congestion, and helps encourage residents to engage in healthy and active lifestyles.
- **Energy Use and Conservation Strategy:** Reduce the carbon footprint of municipal operations to serve as a leader for the community and support the construction of buildings that are energy efficient and incorporate clean, renewable energy sources.
- **Water Use and Efficiency Strategy:** Conserve and protect water resources and promote efficiency through public education.
- **Solid Waste Reduction and Recycling Strategy:** Manage solid waste generation and diversion in order to achieve a zero-waste future.

### 4.4.3 Impact Analysis

#### a. Thresholds of Significance

To determine whether a project would result in a significant impact to Energy, Appendix G of the CEQA Guidelines requires consideration of whether a project would:

1. Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation.
2. Conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

## b. Methodology

Construction energy demand was calculated based on information contained in the CalEEMod run prepared for the project's air quality and GHG emissions studies (Appendices 4.2 and 4.5, respectively). Construction energy demand considers diesel fuel consumption associated with operation of construction equipment and vendor/hauling truck trips, as well as gasoline fuel consumption associated with worker trips to and from construction sites. Energy demand for off-road construction equipment is based on anticipated equipment, usage hours, horsepower, load factors, and construction phase duration provided by the CalEEMod output.

Operational energy demand considers transportation-based fuel consumption as well as electricity and natural gas consumption associated with the project. Transportation-based fuel consumption is based on vehicle miles traveled and fleet mix obtained from CalEEMod. Electricity and natural gas consumption were also based on CalEEMod outputs and compared to existing consumption in the SCE and SCG service areas.

## c. Impact Analysis

**Threshold 1:** Involve the wasteful, inefficient, and unnecessary consumption of energy, especially fossil fuels such as coal, natural gas, and oil, associated with project design, project location, the use of electricity and/or natural gas, and/or the use of fuel by vehicles anticipated to travel to and from the project.

**IMPACT E-1 THE PROJECT WOULD UTILIZE ENERGY DURING CONSTRUCTION THROUGH THE OPERATION OF CONSTRUCTION EQUIPMENT. ADDITIONALLY, THE PROJECT WOULD OPERATE WITH AN INCREASED AMOUNT OF ELECTRICITY, NATURAL GAS, AND GASOLINE. HOWEVER, THE PROJECT WOULD COMPLY WITH CARB CONSTRUCTION REGULATIONS AND WOULD OPERATIONALLY ACCOUNT FOR LESS THAN ONE PERCENT OF SCE AND SCG SUPPLIES. GIVEN THE ABOVE CONSIDERATIONS, THE PROJECT WOULD NOT RESULT IN THE WASTEFUL, INEFFICIENT, OR UNNECESSARY CONSUMPTION OF ENERGY RESOURCES DURING CONSTRUCTION OR OPERATION. IMPACTS WOULD BE LESS THAN SIGNIFICANT. NO MITIGATION MEASURES ARE REQUIRED.**

---

### Construction Energy Demand

During project construction, energy would be consumed in the form of petroleum-based fuels used to power off-road construction vehicles and equipment on the project site, construction worker travel to and from the project site, and vehicles used to deliver materials to the site. The manufacturing of construction materials would also involve energy use. The California Natural Resources Agency (CNRA) acknowledges that a full lifecycle analysis that would account for energy used in building materials and consumer products will generally not be required (CNRA 2018). Additionally, consistent with CEQA Guidelines Section 15145, this analysis does not evaluate upstream energy use as it is too speculative.

The proposed project would require site preparation and grading; pavement and asphalt installation; building construction; architectural coating; and landscaping and hardscaping. Construction would be typical for the region and building types. The total consumption of gasoline and diesel fuel during project construction was estimated using the assumptions and factors from the CalEEMod run used to estimate construction air emissions in the air quality assessment. Worker trips to and from the project site are assumed to use gasoline fuel from passenger cars and light/medium trucks.

Table 4.4-6 presents the estimated construction phase energy consumption, indicating construction equipment, vendor trips, and worker trips would consume approximately 3,509,178 gallons of fuel over the project construction period. Construction equipment would consume approximately 636,003 gallons of diesel fuel; vendor/haul trips would consume approximately 1,083,982 gallons of diesel fuel; and worker trips would consumer approximately 1,789,193.4 gallons of gasoline fuel over the project’s construction period of approximately 16 years. Gasoline and diesel fuel consumption would be spread out over 16 years. This would result in annual diesel consumptions of approximately 107,499.06 gallons and gasoline consumption of approximately 111,824.56 gallons. According to the California Annual Retail Fuel Outlet Report Results (CEC-A15), retail diesel sales in Orange County totaled approximately 55 million gallons, while retail gasoline sales totaled approximately 1.40 billion gallons in 2018 (CEC 2019g). Therefore, annual fuel consumption associated with project construction would account for approximately 0.2 percent of annual retail diesel sales and less than a tenth of a percent of annual retail gasoline sales in Orange County.

**Table 4.4-6 Project Construction Fuel Consumption**

<b>Fuel Type<sup>1</sup></b>	<b>Gallons</b>	<b>MBtu<sup>2</sup></b>
Diesel Fuel (Construction Equipment) <sup>1</sup>	636,003	81,065
Diesel Fuel (Vendor/Haul Trips) <sup>2</sup>	1,083,982	138,164
Other Petroleum Fuel (Worker Trips) <sup>3</sup>	1,789,193	228,051
<b>Total</b>	<b>3,509,178</b>	<b>447,280</b>

<sup>1</sup>Fuel demand rates for construction equipment, hauling and vendor trips, and worker trips are derived from CalEEMod outputs (Urban Crossroads 2019a), fuel consumptions factors for construction vehicle engines (U.S. EPA 2018a), and fuel consumption data from the (U.S. DOT 2018). See Appendix A for calculations and analysis.

<sup>2</sup>CaRFG CA-GREET 3.0 fuel specification of 109,772 Btu/gallon used to identify conversion rate for fuel energy consumption for worker trips specified above. Low-sulfur Diesel CA-GREET 3.0 fuel specification of 127,460 Btu/gallon used to identify conversion rate for fuel energy consumption for construction equipment specified above (CARB 2018f).

Notes: Totals may not add up precisely due to rounding.

CARB has adopted an airborne toxic control measure to limit heavy-duty motor vehicle idling to reduce public exposure to diesel particulate matter and other toxic air contaminants. This measure prohibits diesel-fueled commercial vehicles greater than 10,000 pounds from idling for more than five minutes at any given time. Construction equipment would be maintained to applicable standards, and construction activity and associated fuel consumption and energy use would be temporary and typical for construction sites.

For the reasons listed above, the proposed project would not involve the inefficient, wasteful, and unnecessary use of energy during construction, and the construction-phase impact related to energy consumption would be less than significant.

### Operational Energy Demand

Campus Master Plan implementation would increase area energy demand from greater electricity, natural gas, and gasoline consumption due to an increasing university capacity and overall building square footage. The analysis below conservatively analyzes the energy use from the entire use of the CSUF campus. This analysis conservatively assumes that natural gas and electricity would be used for heating and cooling systems, lighting, appliances, water use, and the overall operation of the project buildings. Gasoline consumption is calculated based on the number of vehicular trips

generated from students and faculty/staff. The estimated number of average daily trips associated with the project from the project’s TIS (Appendix M) is used to determine the energy consumption associated with fuel use from the operation of the project. The majority of the fuel consumption would be from vehicles traveling to and from the campus. According to the CalEEMod calculations, the continued operation of CSUF through the year 2039, including the increase in capacity resulting from full buildout of the Campus Master Plan, would result in an estimated 30,922,635 annual VMT. Table 4.4-7 shows the estimated total annual fuel consumption of the project using the estimated VMT with the assumed vehicle fleet mix (Appendix A). One gallon of gasoline is equivalent to approximately 109,786 Btu (CARB 2015), while one gallon of diesel is equivalent to approximately 127,460 Btu (Schremp 2017).

**Table 4.4-7 Estimated Project Annual Transportation Energy Consumption**

Vehicle Type <sup>1</sup>	Percent of Vehicle Trips <sup>2</sup>	Annual Vehicle Miles Traveled <sup>3</sup>	Average Fuel Economy (miles/gallon) <sup>4</sup>	Total Annual Fuel Consumption (gallons)	Total Fuel Consumption (MBtu) <sup>5</sup>
Passenger Cars	57.0	17,633,849	24.0	734,743	80,664.7
Light/Medium Trucks	35.4	10,937,398	17.4	628,586	69,010.1
Heavy Trucks/Other	7.1	2,196,404	7.4	296,811	32,585.8
Motorcycles	0.5	158,324	43.9 <sup>5</sup>	3,606	395.9
<b>Total</b>	<b>100.0</b>	<b>30,925,975</b>	<b>–</b>	<b>1,663,746</b>	<b>182,656.5</b>

<sup>1</sup> Vehicle classes provided in CalEEMod do not correspond exactly to vehicle classes in DOT fuel consumption data, except for motorcycles. Therefore, it was assumed that passenger cars correspond to the light-duty, short-base vehicle class, light/medium trucks correspond to the light-duty long-base vehicle class, and heavy trucks/other correspond to the single unit, 2-axle 6-tire or more class.

<sup>2</sup> Percent of vehicle trips from Table 4.4 “Fleet Mix” in Air Quality and Greenhouse Gas Impact Study (Appendix A).

<sup>3</sup> Mitigated annual VMT found in Table 4.2 “Trip Summary Information” in Air Quality and Greenhouse Gas Impact Study (Appendix A).

<sup>4</sup> Average Fuel Economy: U.S. Department of Energy, 2018.

<sup>5</sup> U.S. Department of Transportation 2013

<sup>6</sup> CaRFG fuel specification of 109,786 Btu/gallon used to identify conversion rate for fuel energy consumption for vehicle classes specified above (CARB 2015).

Notes: Totals may not add up due to rounding.

Operation of the proposed project would consume approximately 45.1 GWh of electricity per year (Appendix A). As previously mentioned, the campus would continue to be served by SCE, which provided 83,399.9 GWh of electricity in 2018 to its service area. Project electricity consumption would account for less than one percent of the amount of electrical power SCE provides. Therefore, SCE would have sufficient supplies for the project and would not place a significant demand on the electrical supply. Estimated natural gas consumption for the project would be 0.062 MMthm per year (Appendix A). The project’s natural gas demand would be served by SCG, which provided 5,156 MMthm per year in 2018. Based on the provided amount of natural gas that SCG distributes, the project would account for less than one percent of SCG supplies. Therefore, SCG would have sufficient supplies for the project.

The Campus Master Plan would contain several energy efficiency design features that would enable CSUF to achieve its target of reaching zero net energy consumption for new or renovated state buildings starting design after 2025 (CSUF 2019b). The project would comply with all building design standards set in California Building Code (CBC) Title 24, which would minimize the wasteful, inefficient, or unnecessary consumption of energy resources during operation. CALGreen (California Code of Regulations, Title 24, Part 11) requires implementation of energy efficient light fixtures and

building materials into the design of new construction projects. Furthermore, the 2019 Building Energy Efficiency Standards (CBC Title 24, Part 6) requires newly constructed buildings to meet energy performance standards set by the CEC. As the name implies, these standards are specifically crafted for new buildings to result in energy efficient performance so that the buildings do not result in wasteful, inefficient, or unnecessary consumption of energy. The standards are updated every three years and each iteration is more energy efficient than the previous standards. For example, according to the CEC, nonresidential buildings built with the 2019 standards will use about 30 percent less energy due mainly to lighting upgrades (CEC 2018c). University policy requires buildings to exceed Title 24 by 15 percent or meet energy performance goals (CSU 2013b). CSUF also requires all campus projects to achieve a minimum of Silver rating under the GCBI's LEED program (CSUF 2019d). LEED certified buildings enable projects to achieve zero net energy consumption by requiring integrative designs that help reduce overall energy consumption and efficiently monitor energy consumption levels (USGBC 2018). Furthermore, the project would further reduce its use of nonrenewable energy resources as the electricity generated by renewable resources provided by SCE continues to increase to comply with state requirements through Senate Bill 100, which requires electricity providers to increase procurement from eligible renewable energy resources to 33 percent of total retail sales by 2020, 60 percent by 2030, and 100 percent by 2045.

## Mitigation Measures

Mitigation measures are not required.

## Significance After Mitigation

Less than significant impacts would occur.

<b>Threshold 2:</b> Would the project conflict with or obstruct a state or local plan for renewable energy or energy efficiency?
--

**IMPACT E-2 THE CONSTRUCTION AND OPERATION OF NEW BUILDINGS AND BUILDINGS PROPOSED TO BE RENOVATED OR REMODELED UNDER THE CAMPUS MASTER PLAN ARE REQUIRED TO COMPLY WITH APPLICABLE FEDERAL, STATE AND LOCAL POLICIES AND REGULATIONS. ACCORDINGLY, CAMPUS MASTER PLAN BUILDOUT WOULD COMPLY WITH TITLE 24, SB100 AND THE CSU SUSTAINABILITY POLICY AND WOULD NOT CONFLICT WITH OR OBSTRUCT APPLICABLE STATE PLANS RELATED TO RENEWABLE ENERGY OR ENERGY EFFICIENCY. IMPACTS WOULD BE LESS THAN SIGNIFICANT. NO MITIGATION MEASURES ARE REQUIRED.**

As discussed above under Regulatory Setting, SB 100 mandates 100 percent clean electricity for California by 2045. Because the project would be powered by the existing electricity grid, the project would eventually be powered by renewable energy mandated by SB 100 and would not conflict with this statewide plan. Additionally, the buildings would also be subject to the latest energy efficiency standards pursuant to Title 24 requirements.

As described above in Regulatory Setting, the City of Fullerton's CAP contains policies targeting energy efficiency. Although the CSU system acts as an autonomous governing body and is not required to comply with the City's CAP, CSUF would be compliant with local policies and incorporate local strategies in an effort to reduce overall energy consumption. As demonstrated in Table 4.4-8, the project would be consistent with the City's CAP Energy policies that are relevant to this project. As such, the project would not conflict with or obstruct a state or local plan for renewable energy or energy efficiency, and there would be no impact.

**Table 4.4-8 Project Consistency with Applicable Climate Action Plan Policies**

Policies	Project Consistency
<b>Chapter 3: Climate Action Strategies</b>	
<b>Policy E-1:</b> Support regional and sub-regional efforts to reduce greenhouse gas emissions associated with electrical generation through energy conservation strategies and alternative/renewable energy programs.	<b>Consistent.</b> The project buildings would be designed and equipped with features that conserve and reduce energy consumption. The buildings would be in compliance with Title 24, SB100, LEED, and the CSU Sustainability Policy.
<b>Policy E-2:</b> Support projects, programs, policies and regulations to encourage energy and resource efficient practices in site and building design for private and public projects.	<b>Consistent.</b> Buildings would be designed to implement energy conservation features, such as solar ready infrastructure and additional design features in compliance with Title 24, SB100, LEED, and the CSU Sustainability Policy.
<b>Policy E-3:</b> Prepare guidance to homeowners on energy efficient retrofits of existing dwellings	Not applicable to this project.
<b>Policy E-4:</b> Prepare guidance to homeowners on energy efficient retrofits of existing dwellings	Not applicable to this project.
<b>Policy E-5:</b> Support regional and sub-regional efforts pertaining to community revitalization that are rooted in sustainable development principles.	<b>Consistent.</b> All new, renovation, and remodeling activities throughout the duration of the Master Plan would comply with state, local and community sustainability design principles. The university is required to comply with Title 24, SB100, LEED, and the CSU Sustainability Policy.

Source: City of Fullerton 2012b

As part of the CSU system, CSUF is required to abide by the 2014 CSU Sustainability Policy. Policies relating the energy reductions within the CSU Sustainability Policy are listed above under *Regulatory Setting*. In addition to the CSU Sustainability Policy, CSUF must abide by EO-987 which requires CSUF to implement sustainable energy efficient building design features to new construction, remodeling, and renovation that is in compliance with SB100, Title 24 and the most recent LEED principles.

Given required compliance with the above measures, implementation of the Campus Master Plan would not conflict or obstruct with any state or local energy efficiency plan. Impacts would be less than significant.

### Mitigation Measures

Mitigation measures are not required.

### Significance After Mitigation

Less than significant impacts would occur.

*This page intentionally left blank.*

## 4.5 Greenhouse Gas Emissions

---

This section analyzes the potential for the Campus Master Plan to generate excessive GHG emissions and to conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing GHG emissions. The analysis in this section is based upon modeling using the CalEEMod modeling outputs are included in Appendix C of this document.

### 4.5.1 Environmental Setting

#### a. Climate Change and Greenhouse Gases

Climate change is the observed increase in the average temperature of Earth's atmosphere and oceans along with other substantial changes in climate (such as wind patterns, precipitation, and storms) over an extended period of time. The term "climate change" is often used interchangeably with the term "global warming," but "climate change" is preferred to "global warming" because it helps convey that there are other changes in addition to rising temperatures. The baseline against which these changes are measured originates in historical records identifying temperature changes that have occurred in the past, such as during previous ice ages. The global climate is continuously changing, as evidenced by repeated episodes of substantial warming and cooling documented in the geologic record. The rate of change has typically been incremental, with warming or cooling trends occurring over the course of thousands of years. The past 10,000 years have been marked by a period of incremental warming, as glaciers have steadily retreated across the globe. However, scientists have observed substantial acceleration in the rate of warming during the past 150 years (United Nations Intergovernmental Panel on Climate Change [IPCC] 2014). The understanding of anthropogenic warming and cooling influences on climate has led to a high confidence (95 percent or greater chance) that the global average net effect of human activities has been the dominant cause of warming since the mid-20th century (IPCC 2014).

Gases that absorb and re-emit infrared radiation in the atmosphere are called GHGs. The gases widely seen as the principal contributors to human-induced climate change include carbon dioxide (CO<sub>2</sub>), methane (CH<sub>4</sub>), nitrous oxides (N<sub>2</sub>O), fluorinated gases such as hydrofluorocarbons (HFC) and perfluorocarbons (PFC), and sulfur hexafluoride (SF<sub>6</sub>). Water vapor is excluded from the list of GHGs because it only stays in the atmosphere for a short time and its atmospheric concentrations are largely determined by natural processes, such as oceanic evaporation.

Both natural processes and human activities emit GHGs. CO<sub>2</sub> and CH<sub>4</sub> are emitted in the greatest quantities from human activities. Emissions of CO<sub>2</sub> are largely by-products of fossil fuel combustion, whereas CH<sub>4</sub> results from off-gassing associated with agricultural practices and landfills. Observations of CO<sub>2</sub> concentrations, globally-averaged temperature, and sea level rise are generally well within the range of the extent of the earlier IPCC projections. The recently observed increases in CH<sub>4</sub> and N<sub>2</sub>O concentrations are smaller than those assumed in the scenarios in the previous assessments. Each IPCC assessment has used new projections of future climate change that have become more detailed as the models have become more advanced.

Manmade GHGs, many of which have greater heat-absorption potential than CO<sub>2</sub>, include fluorinated gases, such as SF<sub>6</sub> (CalEPA 2006). Different types of GHGs have varying global warming potentials (GWP). The GWP of a GHG is the potential of a gas or aerosol to trap heat in the atmosphere over a specified timescale (generally 100 years). Because GHG absorb different amounts of heat, a common reference gas (CO<sub>2</sub>) is used to relate the amount of heat absorbed to

the amount of the gas emissions, referred to as “carbon dioxide equivalent” (CO<sub>2</sub>e), and is the amount of a GHG emitted multiplied by its GWP. CO<sub>2</sub> has a 100-year GWP of one. By contrast, CH<sub>4</sub> has a GWP of 25, meaning its global warming effect is 25 times greater than CO<sub>2</sub> on a molecule per molecule basis (IPCC 2007).

The accumulation of GHGs in the atmosphere regulates the earth’s temperature. Without the natural heat trapping effect of GHGs, Earth’s surface would be about 34°C cooler (CalEPA 2006). However, emissions from human activities, particularly the consumption of fossil fuels for electricity production and transportation, have elevated the concentration of these gases in the atmosphere beyond the level of naturally occurring concentrations.

## Greenhouse Gas Inventory

### *Global*

Worldwide anthropogenic emissions of GHG were approximately 46,000 million metric tons (MMT, or gigatonne) of CO<sub>2</sub>e in 2010 (IPCC 2014). CO<sub>2</sub> emissions from fossil fuel combustion and industrial processes contributed about 65 percent of total emissions in 2010. Of anthropogenic GHGs, CO<sub>2</sub> was the most abundant accounting for 76 percent of total 2010 emissions. CH<sub>4</sub> emissions accounted for 16 percent of the 2010 total, while N<sub>2</sub>O and fluorinated gases account for six and two percent, respectively (IPCC 2014).

### *Federal*

Total U.S. GHG emissions were 6,586.7 MMT CO<sub>2</sub>e in 2015 (USEPA 2017). Total U.S. emissions have increased by 3.5 percent since 1990; emissions decreased by 2.3 percent from 2014 to 2015 (USEPA 2017). The decrease from 2014 to 2015 was a result of multiple factors, including: (1) substitution from coal to natural gas consumption in the electric power sector; (2) warmer winter conditions in 2015 resulting in a decreased demand for heating fuel in the residential and commercial sectors; and (3) a slight decrease in electricity demand (USEPA 2017). Since 1990, U.S. emissions have increased at an average annual rate of 0.2 percent. In 2015, the industrial and transportation end-use sectors accounted for 29 percent and 27 percent of CO<sub>2</sub> emissions (with electricity-related emissions distributed), respectively. Meanwhile, the residential and commercial end-use sectors accounted for 16 percent and 17 percent of CO<sub>2</sub> emissions, respectively (USEPA 2017).

### *California*

Based on CARB’s California Greenhouse Gas Inventory for 2000-2016, California produced 429.4 MMT CO<sub>2</sub>e in 2016 (CARB 2018a). The major source of GHGs in California is associated with transportation, contributing 41 percent of the state’s total GHG emissions. The industrial sector is the second largest source, contributing 23 percent of the state’s GHG emissions, and electric power accounted for approximately 16 percent (CARB 2018a). California emissions are due in part to its large size and large population compared to other states. However, a factor that reduces California’s per capita fuel use and GHG emissions, as compared to other states, is its relatively mild climate. CARB has projected that statewide unregulated GHG emissions for the year 2020 will be 509 MMT CO<sub>2</sub>e (CARB 2018b). These projections represent the emissions that would be expected to occur in the absence of any GHG reduction actions.

### *California State University*

The CSU system prepared a CO<sub>2</sub> emissions inventory for 2006 emissions (CSU 2007). The total CSU 2006 CO<sub>2</sub> emissions were determined to be 430,495 tons. This was broken down into 201,821 tons of direct emissions (stationary and mobile sources) and 288,675 tons of indirect emissions (purchased power and steam).

CSUF accounted for emissions of 61,429 metric tons (MT) CO<sub>2</sub>e in 2008 (CSUF 2015). This included 39,947 MTCO<sub>2</sub>e from mobile emissions, 20,261 MTCO<sub>2</sub>e from purchased utilities, and 1,220 MTCO<sub>2</sub>e from on-campus stationary sources.

### **Potential Effects of Climate Change**

Globally, climate change has the potential to affect numerous environmental resources through potential impacts related to future air temperatures and precipitation patterns. Scientific modeling predicts that continued GHG emissions at or above current rates would induce more extreme climate changes during the 21st century than were observed during the 20th century. Long-term trends have found that each of the past three decades has been warmer than all the previous decades in the instrumental record, and the decade from 2000 through 2010 has been the warmest. The observed global mean surface temperature for the decade from 2006 to 2015 was approximately 0.87 degrees Celsius (°C) (0.75°C to 0.99°C) higher than the global mean surface temperature over the period from 1850 to 1900. Furthermore, several independently analyzed data records of global and regional Land-Surface Air Temperature (LSAT) obtained from station observations agree that LSAT as well as sea surface temperatures have increased. Due to past and current activities, anthropogenic GHG emissions are increasing global mean surface temperature at a rate of 0.2°C per decade. In addition to these findings, there are identifiable signs that global warming is currently taking place, including substantial ice loss in the Arctic over the past two decades (IPCC 2014 and 2018).

According to *California's Fourth Climate Change Assessment*, statewide temperatures from 1986 to 2016 were approximately 1 degree Fahrenheit (°F) to 2°F higher than those recorded from 1901 to 1960. Potential impacts of climate change in California may include loss in water supply from snowpack, sea level rise, more extreme heat days per year, more large forest fires, and more drought years (State of California 2018a). While there is growing scientific consensus about the possible effects of climate change at a global and statewide level, current scientific modeling tools are unable to predict what local impacts may occur with a similar degree of accuracy. In addition to statewide projections, *California's Fourth Climate Change Assessment* includes regional reports that summarize climate impacts and adaptation solutions for nine regions of the state as well as regionally-specific climate change case studies (State of California 2018a), including for the greater Los Angeles region that includes Orange County where the project is located (State of California 2018b). Below is a summary of some of the potential effects that could be experienced in California and the Los Angeles region as a result of climate change.

### *Air Quality*

Higher temperatures, which are conducive to air pollution formation, could worsen air quality in California. Climate change may increase the concentration of ground-level ozone, but the magnitude of the effect, and therefore its indirect effects, are uncertain. As temperatures have increased in recent years, the area burned by wildfires has increased, and wildfires have been occurring at higher elevations in the Sierra Nevada Mountains (State of California 2018a). If higher temperatures continue to be accompanied by an increase in the incidence and extent of large

wildfires, air quality would worsen. However, if higher temperatures are accompanied by wetter, rather than drier conditions, the rains would tend to temporarily clear the air of particulate pollution and reduce the incidence of large wildfires, thereby ameliorating the pollution associated with wildfires. Additionally, severe heat accompanied by drier conditions and poor air quality could increase the number of heat-related deaths, illnesses, and asthma attacks (California Natural Resources Agency 2009).

In the Los Angeles region, changes in meteorological conditions under climate change will affect future air quality. Regional stagnation conditions may occur more often in the future, which would increase pollutant concentrations (State of California 2018b). Hotter future temperatures will act to increase surface ozone concentrations both due to chemistry producing more ozone and higher rates of biogenic emissions, while increases of water vapor also influence chemistry by increasing ozone production in already polluted areas

### *Water Supply*

Analysis of paleoclimatic data (such as tree-ring reconstructions of stream flow and precipitation) indicates a history of naturally and widely varying hydrologic conditions in California and the west, including a pattern of recurring and extended droughts. Uncertainty remains with respect to the overall impact of climate change on future precipitation trends and water supplies in California. For example, many southern California cities have experienced their lowest recorded annual precipitation twice within the past decade; however, in a span of only two years, Los Angeles experienced both its driest and wettest years on record (California Department of Water Resources [DWR] 2008). This uncertainty regarding future precipitation trends complicates the analysis of future water demand, especially where the relationship between climate change and its potential effect on water demand is not well understood. However, the average early spring snowpack in the western United States, including the Sierra Nevada Mountains, decreased by about 10 percent during the last century. During the same period, sea level rose over 5.9 inches along the central and southern California coast (State of California 2018a). The Sierra snowpack provides the majority of California's water supply by accumulating snow during wet winters and releasing it slowly during dry springs and summers. A warmer climate is predicted to reduce the fraction of precipitation falling as snow and result in less snowfall at lower elevations, thereby reducing the total snowpack (DWR 2008; State of California 2018a). The State of California projects that average spring snowpack in the Sierra Nevada and other mountain catchments in central and northern California will decline by approximately 66 percent from its historical average by 2050 (State of California 2018a).

Like the rest of the State, the Los Angeles region is expected to face a challenging combination of decreased water supply and increased water demand (State of California 2018b). Greater interannual variability of rainfall and sharp decreases in snowpack will create surface water limitations for the region. Although the effect of climate change on average precipitation in the region is still unclear, more frequent occurrences of extreme events similar to the 2011-2016 drought could significantly decrease groundwater recharge, which is essential for the sustainability of agriculture in the region since the vast majority of water used in agriculture in the region is groundwater from local wells. Furthermore, higher temperatures mean that dry years will more quickly develop into severe drought conditions.

### *Hydrology and Sea Level Rise*

As discussed above, climate change could potentially affect the amount of snowfall, rainfall, and snow pack; the intensity and frequency of storms; flood hydrographs (flash floods, rain or snow

events, coincidental high tide and high runoff events); sea level rise and coastal flooding; coastal erosion; and the potential for salt water intrusion. Climate change has the potential to induce substantial sea level rise in the coming century (State of California 2018a). The rising sea level increases the likelihood and risk of flooding. The rate of increase of global mean sea levels over the 2001-2010 decade, as observed by satellites, ocean buoys and land gauges, was approximately 3.2 mm per year, which is double the observed 20th century trend of 1.6 mm per year (World Meteorological Organization [WMO] 2013). As a result, global mean sea levels averaged over the last decade were about 8 inches higher than those of 1880 (WMO 2013). Sea levels are rising faster now than in the previous two millennia, and the rise is expected to accelerate, even with robust GHG emission control measures. The most recent IPCC report predicts a mean sea-level rise of 10 to 37 inches by 2100 (IPCC 2018). A rise in sea levels could completely erode 31 to 67 percent of southern California beaches, result in flooding of approximately 370 miles of coastal highways during 100-year storm events, jeopardize California's water supply due to salt water intrusion, and induce groundwater flooding and/or exposure of buried infrastructure (State of California 2018a). In addition, increased CO<sub>2</sub> emissions can cause oceans to acidify due to the carbonic acid it forms. Increased storm intensity and frequency could affect the ability of flood-control facilities, including levees, to handle storm events.

In the Los Angeles region, despite small changes in average precipitation, dry and wet extremes are both expected to increase. By the late 21st century, the wettest day of the year is expected to increase across most of the region. Increased frequency and severity of atmospheric river events are also projected to occur for this region.

### *Agriculture*

California has a \$50 billion annual agricultural industry that produces over a third of the country's vegetables and two-thirds of the country's fruits and nuts (California Department of Food and Agriculture 2018). Higher CO<sub>2</sub> levels can stimulate plant production and increase plant water-use efficiency. However, if temperatures rise and drier conditions prevail, certain regions of agricultural production could experience water shortages of up to 16 percent; water demand could increase as hotter conditions lead to the loss of soil moisture; crop-yield could be threatened by water-induced stress and extreme heat waves; and plants may be susceptible to new and changing pest and disease outbreaks (State of California 2018a). In addition, temperature increases could change the time of year certain crops, such as wine grapes, bloom or ripen, and thereby affect their quality (California Climate Change Center 2006).

As described above, in the Los Angeles region more frequent droughts could significantly decrease groundwater recharge and therefore impact agricultural operations that use groundwater from local wells (State of California 2018b). This and other climate effects can contribute to higher food prices and shortages. In addition, pest and disease issues with crops are anticipated to increase.

### *Ecosystems and Wildlife*

Climate change and the potential resulting changes in weather patterns could have ecological effects on a global and local scale. Increasing concentrations of GHGs are likely to accelerate the rate of climate change. Scientists project that the annual average maximum daily temperatures in California could rise by 4.4 to 5.8°F in the next 50 years and by 5.6 to 8.8°F in the next century (State of California 2018a). Soil moisture is likely to decline in many regions, and intense rainstorms are likely to become more frequent. Rising temperatures could have four major impacts on plants and animals related to (1) timing of ecological events; (2) geographic distribution and range; (3) species'

composition and the incidence of nonnative species within communities; and (4) ecosystem processes, such as carbon cycling and storage (Parmesan 2006; State of California 2018a).

Many of the impacts identified above would impact ecosystems and wildlife in the Los Angeles region. Increases in wildfire would further remove sensitive habitat; increased severity in droughts would potentially starve plants and animals of water; and sea level rise will affect sensitive coastal ecosystems.

## 4.5.2 Regulatory Setting

### Federal

The U.S. Supreme Court in *Massachusetts et al. v. Environmental Protection Agency et al.* ([2007] 549 U.S. 05-1120) held that the USEPA has the authority to regulate motor-vehicle GHG emissions under the federal Clean Air Act. The USEPA issued a Final Rule for mandatory reporting of GHG emissions in October 2009. This Final Rule applies to fossil fuel suppliers, industrial gas suppliers, direct GHG emitters, and manufacturers of heavy-duty and off-road vehicles and vehicle engines and requires annual reporting of emissions. In 2012, the USEPA issued a Final Rule that establishes the GHG permitting thresholds that determine when CAA permits under the New Source Review Prevention of Significant Deterioration (PSD) and Title V Operating Permit programs are required for new and existing industrial facilities.

In 2014, the U.S. Supreme Court in *Utility Air Regulatory Group v. EPA* (134 S. Ct. 2427 [2014]) held that USEPA may not treat GHGs as an air pollutant for purposes of determining whether a source is a major source required to obtain a PSD or Title V permit. The Court also held that PSD permits that are otherwise required (based on emissions of other pollutants) may continue to require limitations on GHG emissions based on the application of BACT.

### State

#### *Assembly Bill 1493*

AB 1493 (2002), California's Advanced Clean Cars program (referred to as Pavley), requires CARB to develop and adopt regulations to achieve "the maximum feasible and cost-effective reduction of GHG emissions from motor vehicles." On June 30, 2009, USEPA granted the waiver of CAA preemption to California for its GHG emission standards for motor vehicles beginning with the 2009 model year. Pavley I regulates model years from 2009 to 2016 and Pavley II, which is now referred to as "LEV (Low Emission Vehicle) III GHG", regulates model years from 2017 to 2025. The Advanced Clean Cars program coordinates the goals of the LEV, Zero Emissions Vehicles (ZEV), and Clean Fuels Outlet programs, and would provide major reductions in GHG emissions. By 2025, when the rules will be fully implemented, new automobiles will emit 34 percent fewer GHGs and 75 percent fewer smog-forming emissions from their model year 2016 levels (CARB 2011).

#### *Assembly Bill 32*

California's major initiative for reducing GHG emissions is outlined in AB 32, the "California Global Warming Solutions Act of 2006," which was signed into law in 2006. AB 32 codifies the statewide goal of reducing GHG emissions to 1990 levels by 2020 and requires CARB to prepare a Scoping Plan that outlines the main State strategies for reducing GHGs to meet the 2020 deadline. In addition, AB 32 requires CARB to adopt regulations to require reporting and verification of statewide GHG

emissions. Based on this guidance, CARB approved a 1990 statewide GHG level and 2020 limit of 427 million MTCO<sub>2e</sub>. The Scoping Plan was approved by CARB on December 11, 2008 and included measures to address GHG emission reduction strategies related to energy efficiency, water use, and recycling and solid waste, among other measures. Many of the GHG reduction measures included in the Scoping Plan (e.g., Low Carbon Fuel Standard, Advanced Clean Car standards, and Cap-and-Trade) have been adopted since approval of the Scoping Plan.

In May 2014, CARB approved the first update to the AB 32 Scoping Plan. The 2013 Scoping Plan Update defined CARB's climate change priorities for the next five years and set the groundwork to reach post-2020 statewide goals. The update highlighted California's progress toward meeting the "near-term" 2020 GHG emission reduction goals defined in the original Scoping Plan. It also evaluated how to align the State's longer-term GHG reduction strategies with other State policy priorities, including those for water, waste, natural resources, clean energy, transportation, and land use (CARB 2018c).

#### *Senate Bill 32*

SB 32, signed into law on September 8, 2016, extends AB 32 by requiring the State to further reduce GHGs to 40 percent below 1990 levels by 2030 (the other provisions of AB 32 remain unchanged). On December 14, 2017, CARB adopted the 2017 Scoping Plan, which provides a framework for achieving the 2030 target. The 2017 Scoping Plan relies on the continuation and expansion of existing policies and regulations, such as the Cap-and-Trade Program, as well as implementation of recently adopted policies and policies, such as SB 350 and SB 1383 (see below). The 2017 Scoping Plan also puts an increased emphasis on innovation, adoption of existing technology, and strategic investment to support its strategies. As with the 2013 Scoping Plan Update, the 2017 Scoping Plan does not provide project-level thresholds for land use development. Instead, it recommends that local governments adopt policies and locally-appropriate quantitative thresholds consistent with statewide per capita goals of six MTCO<sub>2e</sub> by 2030 and two MTCO<sub>2e</sub> by 2050 (CARB 2017). As stated in the 2017 Scoping Plan, these goals may be appropriate for plan-level analyses (city, county, subregional, or regional level), but not for specific individual projects because they include all emissions sectors in the State (CARB 2017).

#### *Senate Bill 100*

Adopted on September 10, 2018, SB 100 supports the reduction of GHG emissions from the electricity sector by accelerating the State's Renewables Portfolio Standard Program, which was last updated by SB 350 in 2015. SB 100 requires electricity providers to increase procurement from eligible renewable energy resources to 33 percent of total retail sales by 2020, 60 percent by 2030, and 100 percent by 2045.

#### *Senate Bill 97*

SB 97, signed in August 2007, acknowledges that climate change is an environmental issue that requires analysis in CEQA documents. In March 2010, the CNRA adopted amendments to the CEQA Guidelines for the feasible mitigation of GHG emissions or the effects of GHG emissions. The adopted guidelines give lead agencies the discretion to set quantitative or qualitative thresholds for the assessment and mitigation of GHG and climate change impacts.

### *Senate Bill 375*

SB 375, signed in August 2008, enhances the State’s ability to reach AB 32 goals by directing CARB to develop regional GHG emission reduction targets to be achieved from passenger vehicles by 2020 and 2035. In addition, SB 375 directs each of the State’s 18 major Metropolitan Planning Organizations (MPOs) to prepare a “sustainable communities strategy” (SCS) that contains a growth strategy to meet these emission targets for inclusion in the Regional Transportation Plan (RTP). On March 22, 2018, CARB adopted updated regional targets for reducing GHG emissions from 2005 levels by 2020 and 2035. SCAG was assigned targets of an 8 percent reduction in GHGs from transportation sources by 2020 and a 19 percent reduction in GHGs from transportation sources by 2035. In the SCAG region, SB 375 also provides the option for the coordinated development of subregional plans by the subregional councils of governments and the county transportation commissions to meet SB 375 requirements.

### *Senate Bill 1383*

Adopted in September 2016, SB 1383 requires the CARB to approve and begin implementing a comprehensive strategy to reduce emissions of short-lived climate pollutants. The bill requires the strategy to achieve the following reduction targets by 2030:

- Methane – 40 percent below 2013 levels
- Hydrofluorocarbons – 40 percent below 2013 levels
- Anthropogenic black carbon – 50 percent below 2013 levels

The bill also requires the California Department of Resources, Recycling, and Recovery, in consultation with CARB, to adopt regulations that achieve specified targets for reducing organic waste in landfills. For more information on the Senate Bills, Assembly Bills, Executive Orders, and reports discussed above, and to view reports and research referenced above, please refer to the following websites: [www.climatechange.ca.gov](http://www.climatechange.ca.gov) and [www.arb.ca.gov/cc/cc.htm](http://www.arb.ca.gov/cc/cc.htm).

### *Executive Order B-55-18*

On September 10, 2018, Governor Brown issued Executive Order B-55-18, which established a new statewide goal of achieving carbon neutrality by 2045 and maintaining net negative emissions thereafter. This goal is in addition to the existing statewide GHG reduction targets established by SB 375, SB 32, SB 1383, and SB 100.

### *California Integrated Waste Management Act (Assembly Bill 341)*

The California Integrated Waste Management Act of 1989, as modified by AB 341, requires each jurisdiction’s source reduction and recycling element to include an implementation schedule that shows: (1) diversion of 25 percent of all solid waste by January 1, 1995, through source reduction, recycling, and composting activities; (2) diversion of 50 percent of all solid waste on and after January 1, 2000; and (3) diversion of 75 percent of all solid waste by 2020, and annually thereafter. CalRecycle is required to develop strategies to implement AB 341, including source reduction.

### *California Building Standards Code*

The California Code of Regulations (CCR), Title 24, is referred to as the California Building Code, or CBC. It consists of a compilation of several distinct standards and codes related to building construction including plumbing, electrical, interior acoustics, energy efficiency, handicap

accessibility, and so on. The CBC's energy efficiency and green building standards are outlined below.

#### **PART 6 – BUILDING ENERGY EFFICIENCY STANDARDS**

The CCR, Title 24, Part 6 is the Building Energy Efficiency Standards. This code, originally enacted in 1978, establishes energy-efficiency standards for residential and non-residential buildings in order to reduce California's energy demand. The Building Energy Efficiency Standards is updated periodically to incorporate and consider new energy-efficiency technologies and methodologies as they become available. New construction and major renovations must demonstrate their compliance with the current Building Energy Efficiency Standards through submission and approval of a Title 24 Compliance Report to the local building permit review authority and the California Energy Commission (CEC).

The 2019 standards move toward cutting energy use in new homes by more than 50 percent and will require installation of solar photovoltaic systems for single-family homes and multifamily buildings of three stories and less. The 2019 standards focus on four key areas: (1) smart residential photovoltaic systems; (2) updated thermal envelope standards (preventing heat transfer from the interior to exterior and vice versa); (3) residential and nonresidential ventilation requirements; (4) and nonresidential lighting requirements (CEC 2018a). Under the 2019 standards, nonresidential buildings will be 30 percent more energy efficient compared to the 2016 standards, and single-family homes will be 7 percent more energy efficient (CEC 2018b). When accounting for the electricity generated by the solar photovoltaic system, single-family homes would use 53 percent less energy compared to homes built to the 2016 standards (CEC 2018b).

#### **PART 11 – CALIFORNIA GREEN BUILDING STANDARDS**

The California Green Building Standards Code, referred to as CALGreen, was added to Title 24 as Part 11 first in 2009 as a voluntary code, which then became mandatory effective January 1, 2011 (as part of the 2010 CBC). The 2016 CALGreen institutes mandatory minimum environmental performance standards for all ground-up new construction of non-residential and residential structures. It also includes voluntary tiers (I and II) with stricter environmental performance standards for these same categories of residential and non-residential buildings. Local jurisdictions must enforce the minimum mandatory Green Building Standards and may adopt additional amendments for stricter requirements.

The mandatory standards require:

- 20 percent reduction in indoor water use relative to specified baseline levels;
- 50 percent construction/demolition waste diverted from landfills;
- Inspections of energy systems to ensure optimal working efficiency;
- Low-pollutant emitting exterior and interior finish materials such as paints, carpets, vinyl flooring, and particleboards;
- Dedicated circuitry to facilitate installation of EV charging stations in newly constructed attached garages for single-family and duplex dwellings; and
- Installation of EV charging stations at least three percent of the parking spaces for all new multi-family developments with 17 or more units.

The voluntary standards require:

- Tier I—15 percent improvement in energy requirements, stricter water conservation requirements for specific fixtures, 65 percent reduction in construction waste, 10 percent recycled content, 20 percent permeable paving, 20 percent cement reduction, cool/solar reflective roof; and
- Tier II—30 percent improvement in energy requirements, stricter water conservation requirements for specific fixtures, 75 percent reduction in construction waste, 15 percent recycled content, 30 percent permeable paving, and 30 percent cement reduction, cool/solar reflective roof.

Similar to the compliance reporting procedure for demonstrating Building Energy Efficiency Standards compliance in new buildings and major renovations, compliance with the CalGreen water-reduction requirements must be demonstrated through completion of water use reporting forms for new low-rise residential and non-residential buildings. Buildings must demonstrate a 20 percent reduction in indoor water use by either showing a 20 percent reduction in the overall baseline water use as identified in CalGreen or a reduced per-plumbing-fixture water use rate.

### *California State University*

CSU's Sustainability Policy was updated in 2014 to further the system's energy conservation and other sustainability measures goals (CSU 2014). The following measures most applicable to GHG emissions and energy use are:

- **Climate Action Plan**
  - The CSU will strive to reduce systemwide facility GHG emissions to 1990 levels, or below, by 2020 consistent with AB 32, California's Global Warming Solutions Act of 2006 (HSC Section 38550). Emissions will include both State and auxiliary organization purchases of electricity and natural gas; fleet, marine vessel usage; and other emissions the university or self-support entity has direct control over. The Chancellor's Office staff will provide the baseline 1990 facility emission levels (for purchased electricity and natural gas) for the campuses that existed at that time and assist campuses added to the CSU after 1990 to determine their appropriate baseline.
  - The CSU will strive to reduce facility GHG emissions to 80 percent below 1990 levels by 2040. Campus tracking and reporting of their GHG inventory will be grounded in the ACUPCC guidelines or equivalent, with consideration to campus requested improvements. Metrics will include GHG emissions per FTE.
  - The CSU will encourage and promote the use of alternative transportation and/or alternative fuels to reduce GHG emissions related to university associated transportation, including commuter and business travel.
- **Energy Independence and Procurement**
  - The CSU shall pursue energy procurement and production to reduce energy capacity requirements from fossil fuels and promote energy independence using available economically feasible technology for on-site and/or renewable generation.
- **Water Conservation**
  - All CSU campuses will pursue water resource conservation to reduce water consumption by 10 percent by 2016, and 20 percent by 2020 including such steps to develop sustainable landscaping, install controls to optimize irrigation water use, reduce water usage in restrooms and showers, and promote the use of reclaimed/recycled water.

- **Waste Management**
  - Campuses shall seek to reduce the solid waste disposal rate by 50 percent (PRC Section 42921) by 2016, by 80 percent by 2020, and move to zero waste.
- **Sustainable Building Practices**
  - Campuses shall seek to reduce the solid waste disposal rate by 50 percent (PRC Section 42921) by 2016, by 80 percent by 2020, and move to zero waste.
  - The CSU shall design and build all new buildings and major renovations to meet or exceed the minimum requirements equivalent to LEED “Silver.” Each campus shall strive to achieve a higher standard equivalent to LEED “Gold” or “Platinum” within project budget constraints.

CSU released *Sustainability in the California State University: The First Assessment of the 2014 Sustainability Policy* in 2017 (CSU 2017). The report highlighted the progress and achievements made through the first three years of CSU’s Sustainability Policy. The report highlights that CSUF would achieve carbon neutrality by 2050.

#### *American College and University Presidents’ Climate Commitment*

In 2012, CSUF signed the American College and University Presidents’ Climate Commitment (ACUPCC), agreeing to complete an emissions inventory, set target dates and interim milestones for becoming climate neutral, take steps to reduce GHG emissions, and prepare public progress reports (CSUF 2015). This also committed CSUF to achieve carbon neutrality by 2050 from all sources (Scope 1, 2, and 3) by 2050. Scope 1 are direct emissions (e.g., use of natural gas on-site); Scope 2 are indirect emissions (e.g., purchased electricity); and Scope 3 emissions are emissions not under direct control (e.g., commuting and business travel).

## **Regional and Local**

### *Southern California Association of Governments (SCAG)*

SB 375 requires metropolitan planning organizations to prepare an SCS as part of their RTP. The Southern California Association of Governments (SCAG) Regional Council adopted the 2012 RTP/SCS in April 2012 (SCAG 2012), and the 2016–2040 RTP/SCS (2016 RTP/SCS) in April 2016. Both the 2012 and 2016 RTP/SCSs establish a development pattern for the region that, when integrated with the transportation network and other policies and measures, would reduce GHG emissions from transportation (excluding goods movement) (SCAG 2012, 2016). Specifically, the 2012 RTP/SCS links the goals of sustaining mobility with the goals of fostering economic development; enhancing the environment; reducing energy consumption; promoting transportation-friendly development patterns; and encouraging all residents affected by socioeconomic, geographic, and commercial limitations to be provided with fair access. The 2012 and 2016 RTP/SCSs do not require that local general plans, specific plans, or zoning be consistent with SB 375, but provide incentives for consistency for governments and developers.

### *The Fullerton Plan*

The Fullerton Plan details that the City is committed to implementing policies that address energy and resource conservation in order to help resolve the global issue of climate change. The following goals and policies are applicable to the project:

**Goal 5:** A balanced system promoting transportation alternatives that enable mobility and an enhanced quality of life

**Policy 5.2:** Support regional and subregional efforts to increase alternatives to and infrastructure supporting reduction of single occupant vehicle trips.

**Policy 5.13:** Support projects, programs, policies and regulations to encourage transit improvements that incentivize investment and link neighborhoods, while fitting the scale and traffic patterns of the surrounding area.

**Policy 5.16:** Support projects, programs, policies and regulations to encourage the development of private and/or public infrastructure facilitating the use of alternative fuel vehicles.

**Goal 6:** A bicycle-friendly city where bicycling is a safe and convenient alternative to motorized transportation and a recreational opportunity for people of all ages and abilities/

**Policy 6.7:** Support projects, programs, policies, and regulations to reduce negative impacts to and increase opportunities for bicycle users and the bicycle network in private and public development projects.

**Policy 6.12:** Support projects, programs, policies, and regulations to provide convenient bicycle parking and other bicycle facilities in existing and potential high demand locations within the City, such as educational institutions, parks, business districts, transit stops, retail, commercial and employment centers.

**Policy 6.14:** Support projects, programs, policies and regulations to consider bicycle friendly design using new technologies and innovative treatments.

**Goal 19:** An adequate, safe, and reliable water supply.

**Policy 19.3:** Support projects, programs, policies and regulations to encourage the use of new technologies which reduce water use.

**Policy 19.3:** Support projects, programs, policies and regulations to encourage the use of new technologies which reduce water use.

**Policy 19.7:** Support projects, programs, policies and regulations to encourage water efficient practices in site and building design for private and public projects.

**Goal 22:** Participation in regional efforts to address climate change and its local impact.

**Policy 22.1:** Support regional and subregional efforts to reduce greenhouse gas emissions associated with transportation through land use strategies and policies, transportation system improvements, and transportation demand management programs.

**Policy 22.2:** Support regional and subregional efforts to reduce greenhouse gas emissions associated with electrical generation through energy conservation strategies and alternative/renewable energy programs.

**Policy 22.9:** Support projects which voluntarily desire to implement site and/or building design features exceeding minimum requirements to reduce project greenhouse gas emissions.

**Goal 23:** Safe and efficient management of waste.

**Policy 23.3:** Support projects, programs, policies and regulations to promote practices to reduce the amount of waste disposed in landfills.

**Policy 23.7:** Support projects, programs, policies and regulations to consider project level solid waste management needs at the site and building design stages.

### 4.5.3 Impact Analysis

#### a. Thresholds of Significance

To determine whether a project would result in a significant impact to air quality, Appendix G of the CEQA Guidelines requires consideration of whether a project would:

- Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment
- Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of GHGs

Individual projects do not generate sufficient GHG emissions to substantially influence climate change. However, physical changes caused by a project can contribute incrementally to cumulative effects that may be significant, even if individual changes resulting from a project are limited. The issue of climate change typically involves an analysis of whether a project's contribution towards an impact would be cumulatively considerable. "Cumulatively considerable" means that the incremental effects of an individual project are significant when viewed in connection with the effects of past projects, other current projects, and probable future projects (CEQA Guidelines, Section 15064[h][1]).

CSUF has not adopted its own numeric threshold of significance for determining impacts for GHG emissions. In guidance provided by the SCAQMD's GHG CEQA Significance Threshold Working Group in September 2010, SCAQMD considered a tiered approach to determine the significance of residential and commercial projects. The draft tiered approach is outlined in meeting minutes dated September 29, 2010 (SCAQMD 2010):

- **Tier 1.** If the project is exempt from further environmental analysis under existing statutory or categorical exemptions, there is a presumption of less than significant impacts with respect to climate change. If not, then the Tier 2 threshold should be considered.
- **Tier 2.** Consists of determining whether or not the project is consistent with a GHG reduction plan that may be part of a local general plan, for example. The concept embodied in this tier is equivalent to the existing concept of consistency in CEQA Guidelines, Section 15064(h)(3), 15125(d) or 15152(a). Under this Tier, if the proposed project is consistent with the qualifying local GHG reduction plan, it is not significant for GHG emissions. If there is not an adopted plan, then a Tier 3 approach would be appropriate.
- **Tier 3.** Establishes a screening significance threshold level to determine significance. The Working Group has provided a recommendation of 3,000 MTCO<sub>2</sub>e per year for commercial projects.
- **Tier 4.** Establishes a service population threshold to determine significance. The Working Group has provided a recommendation of 4.8 MTCO<sub>2</sub>e per year per service population for land use projects.

The applicable threshold for the proposed project would be an efficiency threshold (per year per service population) as described under Tier 4. This number was derived using 2020 inputs (SCAQMD 2010); therefore, with a project buildout year of 2039, this analysis develops a project-

specific efficiency threshold for 2039 to determine the significance of the project's GHG emissions. In the recently signed EO B-55-18, which identifies a new goal of carbon neutrality by 2045 and supersedes the goal established by EO S-3-05, CARB has been tasked with including a pathway toward the EO B-55-18 carbon neutrality goal in the next Scoping Plan update. While State and regional regulations of energy and transportation systems, along with the State's Cap and Trade program, are designed to achieve most of the reductions needed to meet long-term targets, local governments can do their fair share toward meeting the State's targets by siting and approving projects that accommodate planned population growth that are GHG-efficient. The Association of Environmental Professionals (AEP) Climate Change Committee recommends that CEQA GHG analyses evaluate project emissions in light of the trajectory climate change legislation and assess their "substantial progress" toward achieving long-term reduction targets identified in available plans, legislation, or EOs. Consistent with AEP Climate Change Committee recommendations, GHG impacts that would occur after codified targets are analyzed in terms of whether the project would impede "substantial progress" toward meeting the reduction goal identified in EO B-55-18 (AEP 2016). Avoiding interference with, and making substantial progress toward, these long-term State targets is important as these targets have been set at levels that achieve California's fair share of international emissions reduction targets that will stabilize global climate change effects and avoid the adverse environmental consequences.

The Working Group's efficiency threshold was first reduced to the SB 32's codified 2030 target of 40 percent below 1990 emissions, which would be 2.88 MTCO<sub>2e</sub> per year per service population. A 2.88 MTCO<sub>2e</sub> per year per service population threshold would be reduced by 0.192 MTCO<sub>2e</sub> per year to reach 2045's goal of 0 M CO<sub>2e</sub> per year. Therefore, in the year 2039 this would equate to a 1.15 MTCO<sub>2e</sub> per year per service population threshold that is applied to the project.

### *Project Service Population*

The forecasted service population attributed to the project is estimated as the potential number of students and employees serviced by the academic and residential aspects of the project. The Campus Master Plan aims to increase the FTES of CSUF to 7,000. In addition, the Campus Master Plan would increase faculty and staff by 1,000 to accommodate the increase in students. Therefore, the project would have a service population of 8,000.

## **b. Methodology**

GHG emissions for project construction and operation were calculated using CalEEMod, Version 2016.3.2. The model calculates emissions of the following GHGs: CO<sub>2</sub>, N<sub>2</sub>O, and CH<sub>4</sub>, which are combined using each GHGs' GWP and reported as CO<sub>2e</sub>. The calculation methodology and input data used in CalEEMod can be found in the CalEEMod User's Guide Appendices A, D, and E (CAPCOA 2017). GHG emissions include water and solid waste sources in addition to area, energy, and mobile sources. The input data and subsequent construction and operation GHG emission estimates for the proposed project are discussed below and in Section 4.2, *Air Quality*. CalEEMod output files for the project are included in Appendix C to this report.

Pursuant to SCAQMD Guidance, total construction GHG emissions resulting from the project are amortized over 30 years and added to operational GHG emissions.

## Operational Emissions

### ENERGY SOURCES

Emissions from energy use include electricity and natural gas use. The emissions factors for natural gas combustion are based on USEPA's AP-42 (*Compilation of Air Pollutant Emissions Factors*) and CCAR General Reporting Protocol (CCAR 2009). Electricity emissions only apply to GHG emissions (as the energy is generated off-site and therefore may not be relevant for local and regional air quality conditions) and are calculated by multiplying the energy use times the carbon intensity of the utility district per kWh (CAPCOA 2017). The electricity consumption values in CalEEMod include the CEC-sponsored California Commercial End Use Survey and Residential Appliance Saturation Survey studies. CalEEMod currently incorporates California's 2016 Title 24 building energy efficiency standards. To account for the more stringent 2019 Title 24 standards, a seven percent reduction of energy use was taken across the entire modeled project which is the standard for new construction without solar technology. This is considered a conservative estimate, as Title 24 standards will continue to be revised with increased energy efficiency standards that project buildings will continue to comply with. While it is likely that project buildings would incorporate solar photovoltaic systems into project design, at this stage of planning details of the extent of such systems are unknown; therefore, the model conservatively does not account for generation of solar energy.

Electricity emissions are calculated by multiplying the energy use times the carbon intensity of the utility district per kilowatt hour (CAPCOA 2017). The project would be served by SCE. Therefore, SCE's specific energy intensity factors (i.e., the amount of CO<sub>2</sub>, CH<sub>4</sub>, and N<sub>2</sub>O per kilowatt-hour) are used in the calculations of GHG emissions. The energy intensity factors included in CalEEMod are based on 2012 data at which time SCE had only achieved a 20.6 percent procurement of renewable energy (CPUC 2012). Per SB 100, the statewide RPS Program requires electricity providers to increase procurement from eligible renewable energy sources to 60 percent by 2030 and 100 percent by 2045. To account for the continuing effects of the RPS, the energy intensity factors included in CalEEMod were reduced based on the percentage of renewables reported by SCE. Linear RPS goals were identified between 2030 and 2045 so that an appropriate renewable power generation mix could be applied to the annual electricity-related GHG emissions in 2039. Based on linear interpolation, this analysis assumes that 84 percent of electricity provided to the project site would be generated by renewable power in 2039.

### AREA SOURCES

Emissions associated with area sources, including space and water heating, consumer products, landscape maintenance, and architectural coating were calculated in CalEEMod and utilize standard emission rates from CARB, USEPA, and emission factor values provided by the local air district (CAPCOA 2017).

### WASTE SOURCES

GHG emissions from waste generation were also calculated in CalEEMod and are based on the IPCC's methods for quantifying GHG emissions from solid waste using the degradable organic content of waste (CAPCOA 2017). Waste disposal rates by land use and overall composition of municipal solid waste in California was primarily based on data provided by CalRecycle.

## WATER AND WASTEWATER SOURCES

GHG emissions from water and wastewater usage calculated in CalEEMod were based on the electricity intensity from the CEC's 2006 Refining Estimates of Water-Related Energy Use in California using the average values for northern and southern California. A 20 percent reduction in indoor potable water use was incorporated in the model in accordance with CalGreen standards.

## MOBILE SOURCES

Mobile source GHG emissions are generated by the increase in vehicle trips to and from the project site associated with operation of onsite development. Baseline vehicle trips for the project were calculated using ITE trip generation rates included in CalEEMod for each proposed land use. Baseline trip rates were then adjusted to account for the project generated VMT as determined by the project's TIS (Appendix M). The TIS determined that the project generated VMT per service population would be 14.38 miles; this rate would be for the weekdays when students and employees are commuting to school. Assuming 261 weekdays per year with 8,000 people in the service population (4,000 commuter students, 3,000 resident students, and 1,000 employees), this would result in 30,025,440 annual VMT on weekdays. Due to the school use, Saturday and Sunday trips would be lower and therefore VMT would be reduced. The proportion of trips on these days compared to the weekdays in CalEEMod was used to reduce the VMT accordingly;<sup>1</sup> therefore, 4,997,935 annual VMT would be generated on the 52 Saturdays in a year, and 1,976,785 VMT would be generated on the 52 Sundays in a year. Total project annual VMT was estimated at 37,000,160 VMT, and the CalEEMod output was modified to reflect this VMT total. Modeling did not include potential reductions from implementation of TDM measures.

Because CalEEMod does not calculate N<sub>2</sub>O emissions from mobile sources, N<sub>2</sub>O emissions were quantified using guidance from CARB and the Emission Factor (EMFAC)2017 Emissions Inventory for the Orange County region for the project's operational year (2039) using the EMFAC2011 categories (CARB 2019a and 2019b; see Appendix C for calculations).

**Threshold 1:** Would the project generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment?

**Impact GHG-1** THE PROJECT WOULD GENERATE GHG EMISSIONS DURING CONSTRUCTION AND OPERATION THAT WOULD EXCEED THE PROJECT-SPECIFIC GHG EMISSION THRESHOLD. THIS IMPACT WOULD BE SIGNIFICANT AND UNAVOIDABLE. FOLLOWING MITIGATION, IMPACTS WOULD STILL BE SIGNIFICANT AND UNAVOIDABLE.

This section evaluates potential impacts of the proposed project related to the generation of GHG emissions. Complete modeling results are included as Appendix C of this report.

### *Construction Emissions*

As shown in Table 4.5-1, construction activity for the project would generate an estimated 28,280 MTCO<sub>2</sub>e. When amortized over a 30-year period, construction of the project would generate approximately 943 MTCO<sub>2</sub>e per year.

---

<sup>1</sup> For the student housing uses, Saturdays and Sundays would have 96 percent and 88 percent of the weekday total, respectively; for the university uses, Saturdays and Sundays would have 76 percent and 0 percent of the weekday total, respectively.

**Table 4.5-1 Estimated Construction GHG Emissions**

Construction Year	Annual Emissions (MTCO <sub>2</sub> e)
<b>Phase 1</b>	
2024	536
2025	1,991
2026	3,277
2027	3,791
2028	3,706
2029	1,149
<b>Phase 2</b>	
2030	1,855
2031	2,008
2032	1,568
2033	1,546
2034	231
<b>Phase 3</b>	
2035	1,557
2036	1,820
2037	1,511
2038	1,511
2039	223
<b>Total</b>	<b>28,280</b>
<b>Amortized over 30 years</b>	<b>943</b>

Notes: See Appendix C for modeling results. Some numbers may not add up precisely due to rounding considerations.

### *Operational and Total Project Emissions*

The operational emissions were modeled in CalEEMod for calendar year 2035. Year 2035 was selected in CalEEMod based on the proposed project’s expected operational buildout year of 2039 and model limitation to year 2035. Utilization of year 2035 is conservative and would not underestimate the proposed project’s GHG emissions.

Table 4.5-2 combines the construction and operational GHG emissions associated with development of the project. As shown, annual emissions from the project would be 17,594 MTCO<sub>2</sub>e at project buildout in 2039, equating to 2.20 MTCO<sub>2</sub>e per service person per year. These emissions would exceed the 1.15 MTCO<sub>2</sub>e project-specific threshold, and the project would impose a significant cumulative impact in the surrounding area.

**Table 4.5-2 Combined Annual GHG Emissions**

Emission Source	Annual Emissions MTCO <sub>2</sub> e
<b>Construction</b>	943
<b>Operational</b>	
Area	48
Energy	5,816
Solid Waste	1,303
Water	461
<b>Mobile</b>	
CH <sub>4</sub> and CO <sub>2</sub>	8,961
N <sub>2</sub> O	62
<b>Net Total</b>	<b>17,594</b>
Service Population	8,000 persons
<b>Emissions per Service Person</b>	<b>2.20</b>
2039 Threshold	1.15
<b>Exceeds Threshold?</b>	<b>Yes</b>

Notes: Emissions modeling was completed using CalEEMod, except for N<sub>2</sub>O mobile emissions. See Appendix C for modeling results and N<sub>2</sub>O emissions calculations. Some numbers may not add up precisely due to rounding considerations.

## Mitigation Measures

Mitigation Measure GHG-1 would be implemented to reduce the project’s GHG emissions.

### *GHG-1 GHG Emissions Reduction Plan*

CSUF shall prepare and implement a plan to reduce operational GHG emissions through implementation of one or more of the following measures:

- a. Prior to the construction of Campus Master Plan projects analyzed in this analysis,<sup>2</sup> CSUF shall develop a Greenhouse Gas Reduction Program (GGRP) that reduces annual GHG emissions from the Campus Master Plan by a minimum of the MTCO<sub>2</sub>e per year that the project exceeds for that year and each subsequent year, which is estimated to be 8,281 MTCO<sub>2</sub>e in 2039 (1.15 MTCO<sub>2</sub>e per person per year in 2039) over the operational life of the project, or by an amount determined through further analysis of project GHG emissions at the time of GGRP preparation. The plan may include, but not be limited to, the following components:
  1. Installation of renewable energy facilities (e.g., solar photovoltaics)
  2. Purchase of renewable energy in lieu of fossil-fuel grid sources
  3. Construction of residences that achieve energy and water efficiencies beyond those specified in the California Code of Regulations, Title 24 requirements

<sup>2</sup> The analysis did not include projects in the Campus Master Plan considered “immediate” or part of the five-year capital plan

4. Implementation of energy efficient building design exceeding California Building Code requirements
5. Installation of energy-efficient equipment and appliances exceeding California Green Building Code standards
6. Construction of all-electric buildings
7. Installation of outdoor water conservation and recycling features, such as smart irrigation controllers and reclaimed water usage
8. Installation of low-flow bathroom and kitchen fixtures and fittings
9. Provision of incentives and outreach for future residents to promote alternative transportation and transit use
10. Promotion of alternative fuel vehicles
11. Increased provision of electric vehicle (EV) charging parking spaces beyond required
12. Implementation of carbon sequestration measures

CSUF shall monitor and verify implementation of measures included in the GGRP to ensure implementation of mitigation measures included in the plan.

### Significance After Mitigation

Implementation of Mitigation Measure GHG-1 would reduce GHG emissions through creation and implementation of a GHG Reduction Plan. At this stage of planning, it is unknown what exact measures would be implemented as part of the plan and therefore reductions are not quantifiable. In addition, it is unknown if the measures would be able to reduce emissions to below the applicable thresholds due to the majority of the emissions coming from mobile emissions. Although project design features include TDM implementation that would have the effect of reducing mobile trips that was not included in modeling (e.g., mobility hubs that support transit, bikeshare, scootershare, carshare, on-demand rideshare, microtransit, EVs, and rideables), ultimately vehicle emissions depend on individual transportation choices that CSUF would not have full control over. Therefore, impacts from GHG emissions would be significant and unavoidable.

<b>Threshold 2:</b> Would the project conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs?
--

**Impact GHG-2** DUE TO PROJECT GHG EMISSIONS DURING CONSTRUCTION AND OPERATION THAT WOULD EXCEED THE PROJECT-SPECIFIC GHG EMISSION THRESHOLD, THE PROJECT WOULD CONFLICT WITH THE GOALS OF THE 2017 SCOPING PLAN, EO B-55-18, AND ACUPCC. THIS IMPACT WOULD BE SIGNIFICANT AND UNAVOIDABLE. FOLLOWING MITIGATION, IMPACTS WOULD STILL BE SIGNIFICANT AND UNAVOIDABLE.

The Campus Master Plan was evaluated for consistency with applicable local and State plans that were developed with the intent of reducing GHG emissions. Each applicable plan is discussed separately below.

### 2017 Scoping Plan and EO B-55-18

The 2017 Scoping Plan outlines a pathway to achieving the reduction targets set under SB 32, which is considered an interim target toward meeting long-term 2045 goal established by EO B-55-18. The project would impede “substantial progress” toward meeting the SB 32 and EO B-55-18 targets if per service person GHG emissions exceeded the project-specific 2039 GHG emission threshold. As

discussed under Impact GHG-1, the project's GHG emissions would exceed the 2039 efficiency threshold. As a result, the project would potentially conflict with the reduction targets of 2017 Scoping Plan and EO B-55-18, and impacts would be significant.

### Consistency with the CSU Sustainability Policy

The CSU Sustainability Policy aims to reduce the environmental impact of construction and operation of buildings and to integrate sustainability across the curriculum. The main goal relevant to the project would be the policy to reduce GHG emissions 80 percent below 1990 levels by 2040. This emissions reduction target applies to only Scope 1 and 2 emissions. The project-specific GHG emissions threshold developed for the Campus Master Plan in this analysis is an interpolated target for 2039 to comply with a net-zero emissions date of 2045, which would result in a similar reduction of approximately 80 percent in 2040. In addition, this target includes Scope 3 emissions (e.g., mobile emissions). While the project does not meet the project-specific 2039 threshold, this is mostly due to mobile emissions, which are part of Scope 3 emissions that are not included in the CSU Sustainability Policy's goal. Without mobile emissions, the project would result in an emissions per service person of 1.08 MTCO<sub>2e</sub> in 2039, which would be within the 1.15 MTCO<sub>2e</sub> threshold and would be on pace to reach the 2040 goal with Scope 1 and 2 emissions. Therefore, the project would be consistent with the CSU Sustainability Policy.

### Consistency with the American College and University Presidents' Climate Commitment

CSUF committed to achieve carbon neutrality by 2050 from all sources through the ACUPCC. As shown in Impact GHG-1, the project would exceed the project-specific 2039 GHG emission threshold, which was developed with a trajectory to reach carbon neutrality by 2045. Interpolating the 2030 emission threshold of 2.88 MTCO<sub>2e</sub> per year per service population out to 2039 with a carbon neutrality goal in 2050 (as opposed to 2045) would result in a 2039 target of 1.69 MTCO<sub>2e</sub> per year per service population. As the project is estimated to result in an emissions per service population of 2.20 MTCO<sub>2e</sub> per year, this would result in an exceedance of the target based upon the ACUPCC's 2050 goal. Therefore, project would potentially conflict with the reduction targets of the ACUPCC, and impacts would be potentially significant.

### Mitigation Measures

See Mitigation Measure GHG-1 under Impact GHG-1.

### Significance After Mitigation

See *Significance After Mitigation* discussion under Impact GHG-1. As mitigation would still result in GHG emissions that exceed the project-specific 2039 GHG emission threshold and therefore impede "substantial progress" toward meeting the SB 32, EO B-55-18, and ACUPCC targets, impacts under Impact GHG-2 would be significant and unavoidable after mitigation.

### Cumulative Impacts

The planned and pending projects near the proposed project are listed in Table 3-1 (Section 3, *Environmental Setting*). Each of these projects would generate GHG emissions from vehicle trips, electrical and water use, and other sources. The analysis of GHG emissions is cumulative in nature, as emissions affect the accumulation of GHGs in Earth's atmosphere. Projects that fall below thresholds are considered to have a less than significant impact, both individually and cumulatively.

As indicated in Impact GHG-1 and Impact GHG-2, the project would have a significant and unavoidable impact on GHG emissions and conflicts with GHG reduction plans, primarily due to the mobile emissions from the project. Implementation of Mitigation Measure GHG-1 would reduce GHG emissions through creation and implementation of a GHG Reduction Plan. At this stage of planning, it is unknown what exact measures would be implemented as part of the plan and therefore reductions are not quantifiable. In addition, it is unknown if the measures would be able to reduce emissions to below the applicable thresholds due to the majority of the emissions coming from mobile emissions. Campus TDM measures have been established to help reduce overall VMT and GHG emissions. TDM implementation includes short term, medium term, and long term measures that range from first year parking bans to variable parking pricing and overall street improvements. Splitting up campus TDM strategies into three phases helps ensure that CSUF is able to achieve GHG reductions throughout the duration of the Campus Master Plan. Further discussion on proposed TDM measures is discussed in Section 4.11, *Transportation*. Although project design features include TDM implementation that would have the effect of reducing mobile trips that was not included in modeling, ultimately vehicle emissions depend on individual transportation choices that CSUF would not have full control over. Therefore, impacts from GHG emissions would be significant and unavoidable even with mitigation, and the project would result in a significant and unavoidable cumulatively considerable impact to GHG emissions.

*This page intentionally left blank.*

## 4.6 Geology and Soils

---

This section analyzes the Campus Master Plan's potential impacts with regard to geology, soils, and paleontological resources. Mitigation measures are included where potentially significant impacts were identified.

### 4.6.1 Environmental Setting

#### a. Existing Geologic Setting and Hazards

##### Regional Geology and Drainage

Orange County is geographically and topographically diverse, encompassing mountains, hills, flatland and coastline. The City of Fullerton is located in the northwest portion of Orange County, northwest of the Santa Ana mountains, and within the lowlands coastal plains of Orange County, which extends from Irvine into Los Angeles County. The coastal plain of Los Angeles County and Orange County borders the Santa Ana Mountains, and Puente Hills, Repetto, and Elysian to the northeast, the Santa Ana Mountains to the southeast, the San Joaquin Hills to the South, and the Pacific Ocean to the west.

Orange County was largely formed by recent Holocene alluvial deposits. The coastal plain within Orange County is underlain by deep structural depressions containing sedimentary rock (Fullerton 2012a). The subsurface varies in thickness and lithology as a result of the rapid deposition of rock, folding, and faulting. A large portion of the sedimentary deposits has gradually been removed through natural processes such as erosion.

There are three major rivers in the region. The Rio Hondo River flows southwest and merges with the Los Angeles River. The San Gabriel River flows south of and parallel to the Los Angeles River. The largely unchannelized Santa Ana River originates in the San Bernardino Mountains and traverses San Bernardino, Orange, and Riverside Counties. Each of the rivers ultimately discharges into the Pacific Ocean.

CSUF lays within the Orange County Groundwater Basin (OCGB) which is controlled and monitored by the OCWD. This groundwater basin supplies approximately 70 percent of the water supply for residents in north and central Orange County (OCWD 2015). The district's surface water recharge system consists of 23 recharge facilities. Recharge basins are located adjacent to the Santa Ana River in the City of Anaheim and Santiago Creek in the City of Orange. The OCWD monitors the quality of groundwater being supplied to Orange County residents, along with monitoring the levels of available water supply on an annual basis. The OCGB is divided into two hydrologic divisions; The Forebay and Pressure Areas. A Forebay refers to an area of intake or recharge where most of the groundwater recharge occurs due to highly permeable sands and discontinuous clay that allow direct percolation of Santa Ana River and other surface water. The Forebay area encompasses most of the cities of Anaheim, Fullerton and Villa Park.

##### Local Geology

The City of Fullerton is divided into two distinct geographical areas. The southern portion of the City is primarily flat with areas of gradual slopes to the south and west. The northern portion of the city consists of gently rising foothills (City of Fullerton 2012a).

The City of Fullerton is located within the Los Angeles basin. There are three geologic and geographic divisions represented in the City: the Central Plain, Coyote Hills, and a small area north of Coyote Hills. The Central Plain extends from the southern portion of the City to the northern edge of Coyote Hills and makes up approximately one-half of the City. Coyote Hills covers the northern portion of the City and makes up approximately one-half of the City (City of Fullerton 2012a).

Geologic structures in the City run roughly east to west. Major groups of deep geologic strata consist of Basement Complex schist, which underlies Puente Hills at depth, and the Puente Formation, which is a series of shales and sandstone of Miocene Age (approximately 15 million years old). The Puente Formation is present at great depth below the Fernando Formation, south of the Whittier Fault. The Fernando Formation consists of sandstone and silty sandstone of Pliocene Age (3 to 12 million years old). Overlying the Fernando Formation is the quaternary group consisting of the San Pedro, Coyote Hills, and La Habra formations. The quaternary group represents the newest formations, formed during the last three million years on the geologic time scale, and consist of loosely jointed sandstone, siltstone, and conglomerate beds.

Fullerton is underlain by three primary soil units: surficial formations, terrace deposits, and alluvium. The surficial and terrace deposits are interspersed in the northern portion of the City. Alluvium underlays the southern portion of the City (City of Fullerton 2012a).

### *Geologic Hazards*

#### **SOILS**

The City of Fullerton is highly urbanized. The Fullerton Plan, acknowledges that surface soils in the City may no longer reflect natural soil associations and characteristics since topsoil in the City has been developed (City of Fullerton 2012a). According to the United States Department of Agriculture Soil Conservation Service General Soil Map, 15 soil types and characteristics are found within the City of Fullerton.

The CSUF campus is underlain by Mocho Loam soil with 0 to 2 percent slope (USDA 2019). This type of soil is characterized as generally level that occurs on fans or floodplains. Runoff is typically slow, and the erosion hazard is minimal. The soil retains a relatively high amount of water, with an available water capacity of 9.5 to 12.0 inches (City of Fullerton 2012a).

#### **SEISMICITY AND SURFACE FAULT RUPTURE**

The numerous faults in southern California include active, potentially active, and inactive faults. The criteria for these major groups are based on criteria developed by the California Geologic Survey (CGS) for the Alquist-Priolo Earthquake Fault Zone Program. By definition, an active fault is one that has had surface displacement within Holocene time (about the last 11,000 years). A potentially active fault has demonstrated surface displacement during Quaternary time (approximately the last 1.6 million years) but has had no known Holocene movement. Faults that have not moved in the last 1.6 million years are considered inactive.

The City of Fullerton has two main faults that traverse through the city limits. The Norwalk Fault traverses the central and southeastern portion of the City of Fullerton, extending approximately 17 miles from Norwalk to Coyote Hills. The fault is noted as a possible source of a magnitude 4.7 earthquake occurring on July 8, 1929 which caused significant damage to Whittier and Norwalk. Microseismic activity along the Norwalk Fault is high; the fault may be capable of generating a magnitude 6.3 earthquake on the Richter Scale. The Norwalk Fault is one of two faults within the

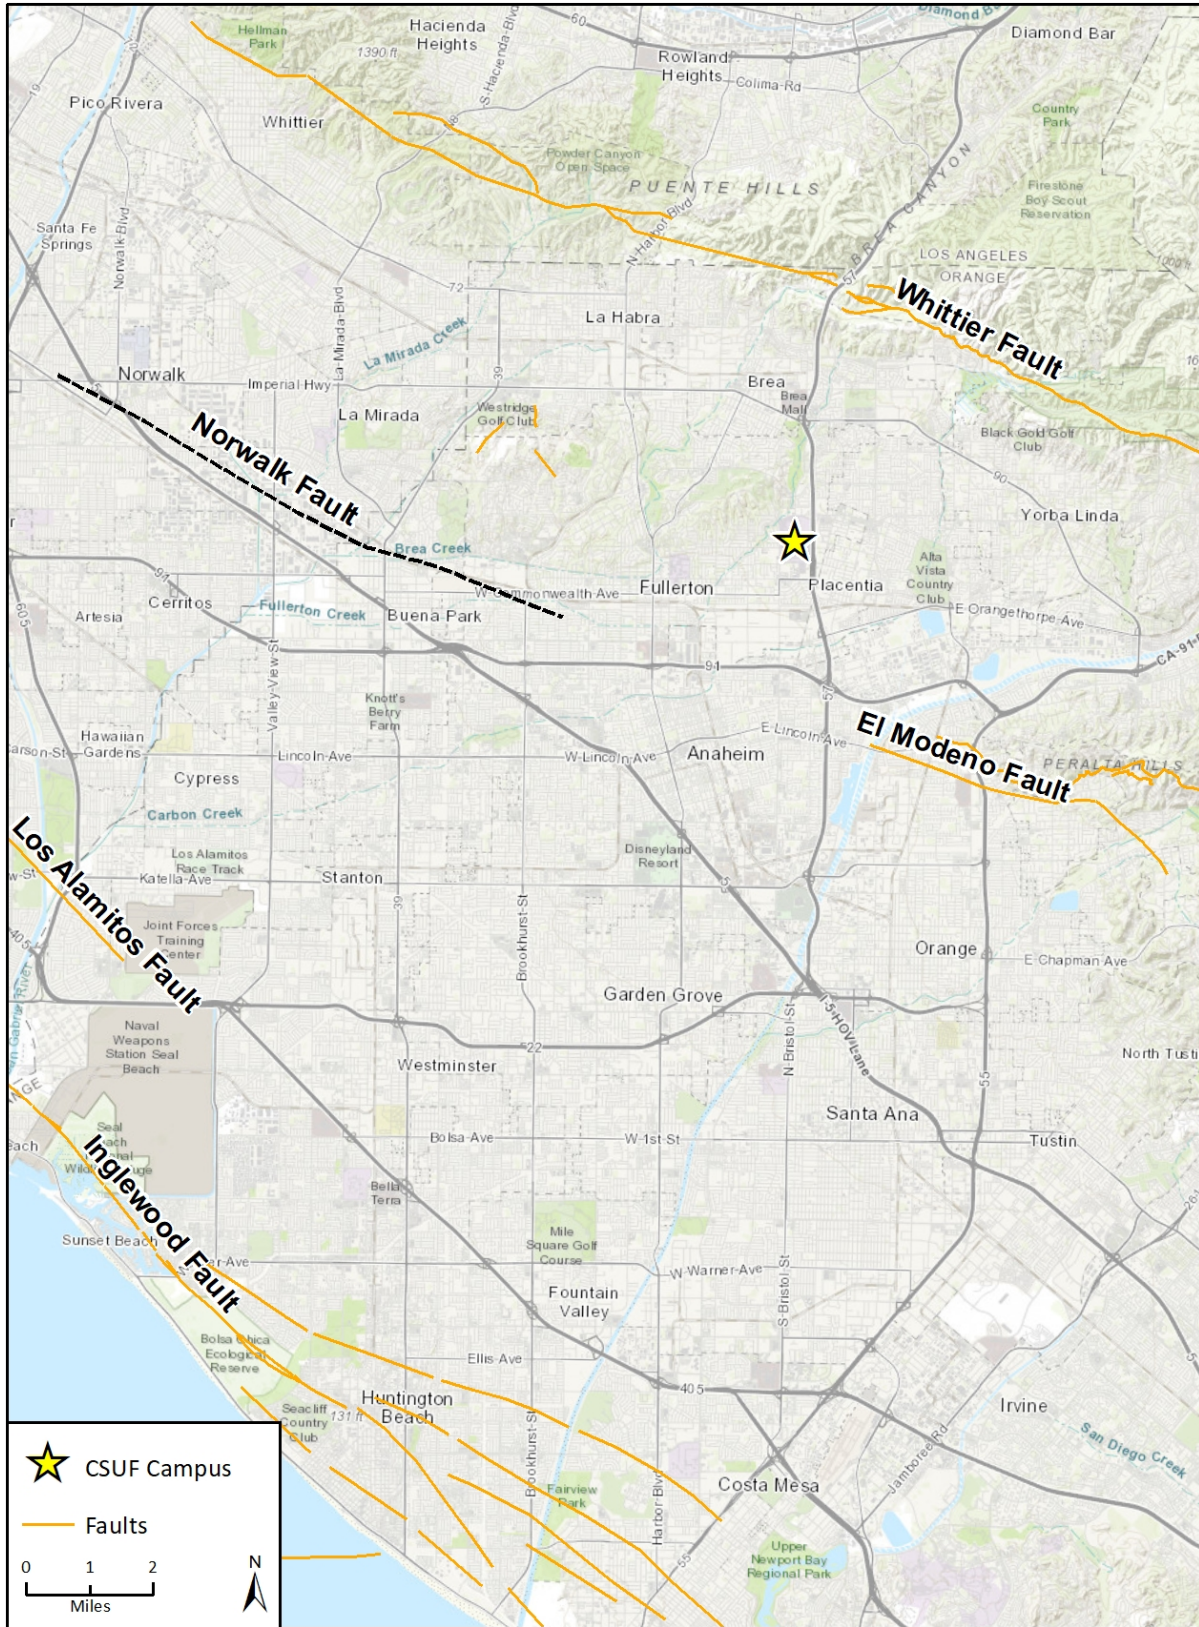

City of Fullerton however, no surface faulting has been associated with this fault. The second fault that runs through the City is the Puente Hills Fault. The Puente Hills Fault, or the Puente Hills thrust system, underlies the East and West Coyote Hills located in the northern and western portions of the City. The fault has a history of having a lack of superficial ground features normally associated with thrust faults that have recently experienced seismic activity. The Puente Hills Fault is comprised of three fault segments: The Los Angeles; the Santa Fe Springs, and the Coyote Hills segments, from west to east, respectively. The fault terminates at a depth of approximately two miles and extends for 25 to 30 miles from northern Orange County, running beneath downtown Los Angeles to approximately the Beverly Hills area. The fault encompasses several hundred square miles of densely populated urban areas. At least four large earthquakes with magnitudes ranging from 7.2 to 7.5 occurred over the past 11,000 years. The United States Geological Survey (USGS) National Seismic Hazard Maps have indicated this fault as active, with a magnitude range of 6.65 to 7.45. The City has identified several additional faults that run throughout the surrounding region; the closest fault being the Whittier-Elsinore Fault located approximately 1.6 miles northeast of the City; the farthest being the San Andreas Fault located approximately 37 miles northeast of the City. Neither the Norwalk Fault or the Puente Hills Fault has resulted in surface faulting. Additionally, the campus is not within an Alquist-Priolo Earthquake Fault Zone and has no active faults that pass directly beneath it (City of Fullerton 2012a). Table 4.6-1 illustrates the surrounding regional faults in relation to CSUF. Figure 4.6-1 shows the fault zones in proximity to CSUF.

The City of Fullerton is subject to seismic ground shaking to the close proximity and potential earthquake magnitude of nearby faults. The Norwalk Fault and the Puente Hills Fault have the greatest potential for causing the greatest extent of ground shaking in the City. Additional nearby regional faults, including the Whittier-Elsinore Fault, the Newport-Inglewood Fault, and the Sierra Madres/San Fernando/Santa Susana Fault, could also result in significant ground shaking.

**Table 4.6-1 Regional Faults in Relation to CSUF Campus**

<b>Fault Name</b>	<b>Local/Distance from CSUF to Fault</b>	<b>Length of Fault (miles)</b>
Norwalk Fault	2.75 miles west	17
Puente Hills Fault	4 miles northwest	25
Whittier Fault	2.75 miles north	135-145
Newport-Inglewood Fault	13.75 miles south	50-86
San Andreas Fault	33 miles north	300-320

Figure 4.6-1 Regional Earthquake Fault Zones

Fig. 4.6-1 Regional Earthquake Fault Zones

## LIQUEFACTION AND LATERAL SPREADING

Liquefaction describes a phenomenon in which loose, saturated, relatively cohesionless soil deposits lose shear strength during strong ground motions. Primary factors controlling liquefaction include intensity and duration of ground motion, gradation characteristics of the subsurface soils, on-site stress conditions, and the depth to groundwater. Liquefaction is typified by a loss of shear strength in the liquefied layers due to rapid increases in pore water pressure generated by earthquake accelerations. Liquefaction typically occurs in areas where the soils below the water table are composed of poorly consolidated, fine to medium-grained, primarily sandy soil. In addition to the requisite soil conditions, the ground acceleration and duration of the earthquake must also be of a sufficient level to induce liquefaction.

Liquefaction may also lead to lateral spreading. Lateral spreading (also known as expansion) is the horizontal movement or spreading of soil toward an “open face,” such as a streambank, the open side of fill embankments, or the sides of levees. It often occurs in response to liquefaction of soils in an adjacent area. The potential for failure from lateral spreading is highest in areas where there is a high groundwater table, where there are relatively soft and recent alluvial deposits, and where creek banks are relatively high.

The CGS Seismic Hazard Zones Map identifies that the City, especially the southwestern portion, has high potential for liquefaction. CGS has identified that the northern portion of the CSUF campus, including Parking Lot A, Parking Lot A South, Parking Lot G, and the northern half of the Titan Sports Complex is within a liquefaction zone but does not lay within an earthquake fault zone. The southern portion of the campus is not within a liquefaction zone or an earthquake fault zone. Figure 4.6-2 illustrates the closest liquefaction zone to CSUF, with the dark teal color indicating the liquefaction zone that underlays the northern portion of campus.

## SUBSIDENCE

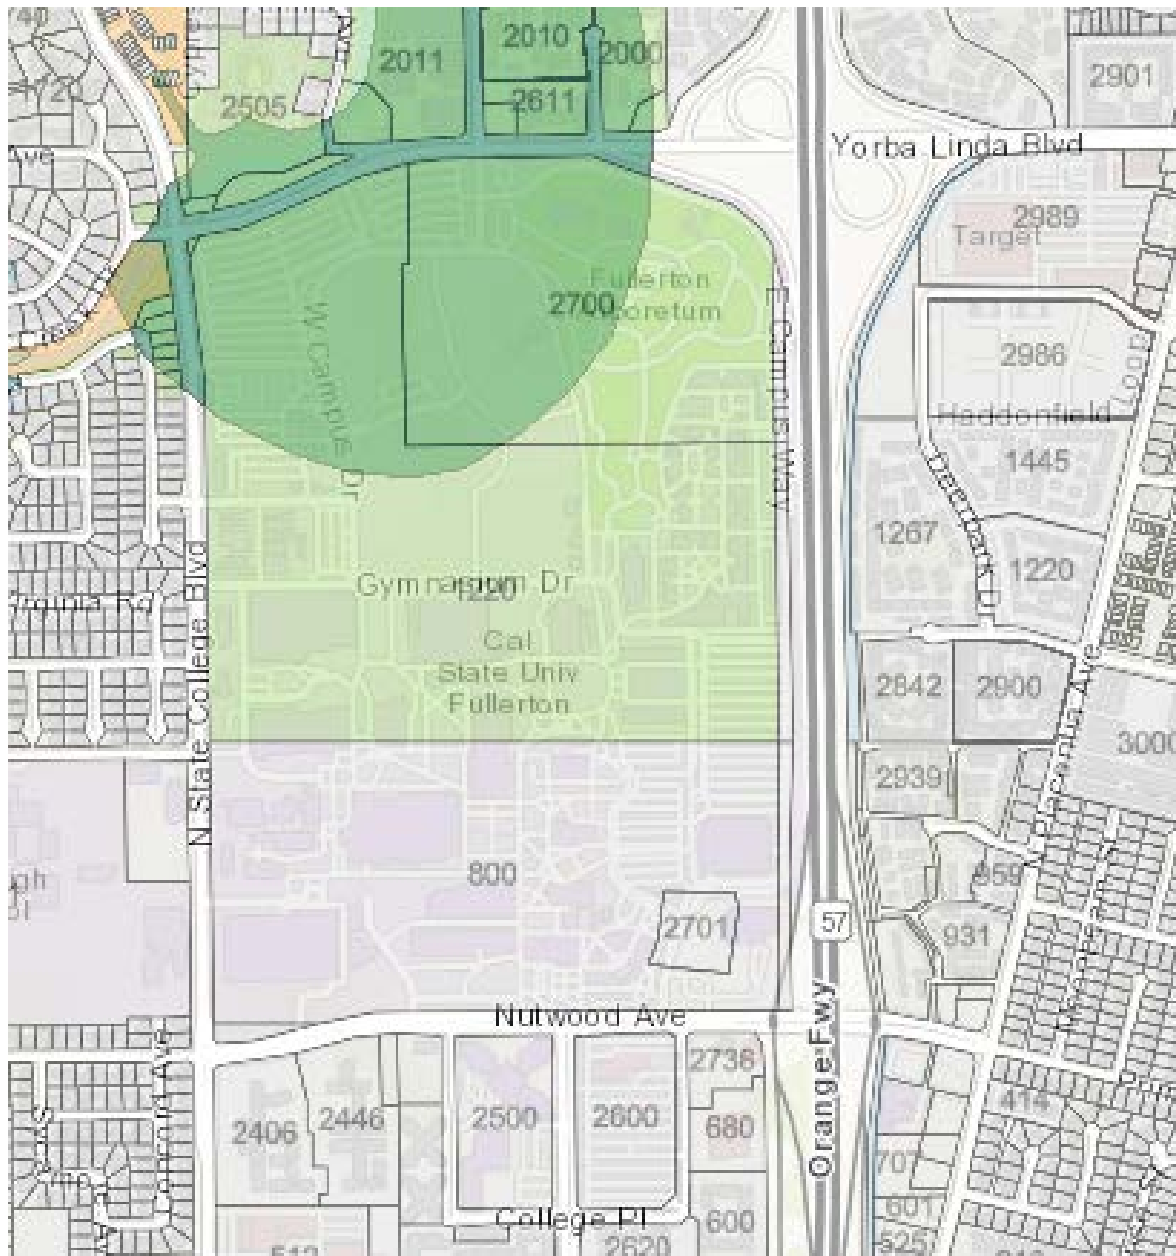

Subsidence occurs when a large portion of land is displaced vertically, usually due to the withdrawal of groundwater, oil, or natural gas. Soils particularly subject to subsidence include those with high silt or clay content. Soils with high shrink-swell potential can be particularly susceptible to subsidence during a loss of soil moisture. CSUF is located on Mocho loam on a zero to two percent slope; which has potential of slight to moderate shrink-swell. Additionally, subsidence hazards can occur from the settlement of under-consolidated soils that may occur during earthquake shaking. The Fullerton Plan has identified that zones subject to subsidence resulting from consolidations include the central and northern portions of the City. The City has no ongoing or planned large-scale extractions of groundwater or petroleum that would cause subsidence associated with fluid withdrawal.

## LANDSLIDES

Landslides occur when slopes become unstable and masses of earth material move downslope. Landslides are generally considered to be rapid events, often triggered during periods of rainfall or by earthquakes. Mudslides and slumps are a shallower type of slope failure compared to landslides. Lateral spreading may occur when potentially liquefiable soils are present and exposed in conjunction with a sloping ground surface. If soils in the slope liquefy, temporary instability could result in movement of sediments and slope failure. Areas in the city that are identified as earthquake-induced landslide zones are in the northwestern and eastern portions of the city (City of Fullerton 2012a).

Figure 4.6-2 Liquefaction Zone

The CSUF campus is not located in an area for earthquake-induced landslides. The topography at the campus is relatively flat due to grading and development. Additionally, the campus is not in the path of any known or potential landslides.

## 4.6.2 Regulatory Setting

### Federal

#### *Earthquake Hazards Reduction Act*

U.S. Congress passed the Earthquake Hazards Reduction Act in 1977 to reduce the risks to life and property from future earthquakes through the establishment and maintenance of an effective earthquake hazards reduction program. To accomplish this goal, the act established the National Earthquake Hazards Reduction Program. This program was substantially amended in November 1990 by the National Earthquake Hazards Reduction Program Act, which refined the description of agency responsibilities, program goals, and objectives to focus on minimizing loss from earthquakes after they occur. The National Earthquake Hazards Reduction Program promotes the adoption of earthquake hazard reduction activities by all scales of government and works to develop national building standards and model codes for use by engineers, architects, and all others involved in the planning and construction of buildings and infrastructure.

### State

#### *Alquist-Priolo Earthquake Fault Zoning Act*

The Alquist-Priolo Earthquake Fault Zoning Act of 1972 (Alquist-Priolo Act; Public Resources Code Sections 2621-2630) was passed into law following the destructive February 9, 1971 San Fernando earthquake that had a magnitude of 6.6. The Alquist-Priolo Act provides a mechanism for reducing losses from surface fault rupture on a statewide basis. The intent of the Alquist-Priolo Act is to ensure public safety by prohibiting the siting of most structures for human occupancy across traces of active faults that constitute a potential hazard to structures from surface faulting or fault creep. Generally, siting of structures for human occupancy must be set back from the fault by approximately 50 feet. Therefore, if a project site is located in an Earthquake Fault Zone, the City must withhold development permits for sites within the fault zones until geologic investigations demonstrate that the sites are not threatened by surface displacement from future faulting.

#### *Seismic Safety Act*

The California Seismic Safety Commission was established by the Seismic Safety Act in 1975 with the intent of providing oversight, review, and recommendations to the Governor and State Legislature regarding seismic issues. The Commission's name was changed to Alfred E. Alquist Seismic Safety Commission in 2006. Since then, the Commission has prepared several documents based on recorded earthquakes, such as the 1994 Northridge earthquake, 1933 Long Beach earthquake, and the 1971 Sylmar earthquake. Some of these documents are listed as follows:

- Research and Implementation Plan for Earthquake Risk Reduction in California 1995 to 2000, report dated December 1994
- Seismic Safety in California's Schools, 2004, "Findings and Recommendations on Seismic Safety Policies and Requirements for Public, Private, and Charter Schools," report dated December 1994
- Findings and Recommendations on Hospital Seismic Safety, report dated November 2001
- Commercial Property Owner's Guide to Earthquakes Safety, report dated October 2006
- California Earthquake Loss Reduction Plan 2007–2011, report dated July 2007

### *Seismic Hazards Mapping Act*

The Seismic Hazards Mapping Act of 1990 was enacted, in part, to address seismic hazards not included in the Alquist-Priolo Act, including strong ground shaking, landslides, and liquefaction. Under this Act, the State Geologist is assigned the responsibility of identifying and mapping seismic hazards. CGS Special Publication 117, adopted in 1997 by the State Mining and Geology Board, constitutes guidelines for evaluating seismic hazards other than surface faulting, and for recommending mitigation measures as required by Public Resources Code Section 2695(a). In accordance with the mapping criteria, the CGS seismic hazard zone maps identifies areas with the potential for a ground shaking event that corresponds to 10 percent probability of exceedance in 50 years.

The purpose of the Seismic Hazards Mapping Act is to reduce the threat to public health and safety and to minimize the loss of life and property by identifying and mitigating seismic hazards. Cities, counties, and state agencies are directed to use seismic hazard zone maps developed by CGS in their land-use planning and permitting processes. The Seismic Hazards Mapping Act requires site-specific geotechnical investigations prior to permitting most urban development projects in seismic hazard zones.

### *California Building Code*

The CBC Title 24, Part 2, provides building codes and standards for the design and construction of structures in California. The purpose of the CBC is to establish minimum standards to safeguard the public health, safety, and general welfare through structural strength, means of egress facilities, and general stability by controlling the design, construction, quality of materials, use and occupancy, location, and maintenance of building and structures. The CBC contains specific requirements for seismic safety, excavation, foundations, retaining walls, and site demolition. It also regulates grading activities, including drainage and erosion control. Chapter 16 of the CBC contains definitions of seismic sources and the procedure used to calculate seismic forces on structures.

The CBC is updated every three years by order of the legislature, with supplements published in intervening years. State Law mandates that local government enforce the CBC. In addition, a city and/or county may establish more restrictive building standards reasonably necessary because of local climatic, geological, or topographical conditions. The 2019 CBC is based on the 2018 International Building Code, with the addition of more extensive structural seismic provisions.

### *Natural Hazards Disclosure Act*

The Natural Hazards Disclosure Act, as codified in California Civil Code Section 1103-1103.14, requires real estate sellers and brokers to prepare Natural Hazards Disclosure Statements upon transfer of real property if such property is located within a number of federally or state-mapped natural hazard areas. Hazard areas covered under the disclosure form include special flood hazard areas, areas of potential flooding due to dam failure inundation, fire hazard severity zones, wildland areas, earthquake fault zones, and seismic hazard zones.

The natural hazard areas most relevant to geology and soils are earthquake fault zones and seismic hazard zones. As discussed above, the campus is not located within an earthquake fault zone. The northern part of campus is located in a potential liquefaction zone. This analysis addresses impacts and mitigation measures related to this seismic hazard.

### *National Pollutant Discharge Elimination System*

The federal government administers the National Pollutant Discharge Elimination System (NPDES) permit program, which regulates discharges into surface waters under the Clean Water Act (CWA). The primary regulatory control relevant to the protection of water quality is the NPDES permit administered by the State Water Resources Control Board, which establishes requirements prescribing the quality of point sources of discharge and water quality objectives. These objectives are established based on the designated beneficial uses (e.g., water supply, recreation, and habitat) for a particular surface waterbody. NPDES permits are issued to point source dischargers of pollutants to surface waters pursuant to Water Code Chapter 5.5, which implements the federal CWA. Examples include, but are not limited to, public wastewater treatment facilities, industries, power plants, and groundwater cleanup programs discharging to surface waters (State Water Resources Control Board, Title 23, Chapter 9, Section 2200). The Regional Water Quality Control Board (RWQCB) establishes and regulates discharge limits under the NPDES permits.

Construction projects which disturb one or more acres of soil or are part of a larger common plan of development that disturbs one or more acres of soil must obtain coverage under the statewide NPDES General Permit for Discharges of Stormwater Associated with Construction Activity (Construction General Permit Order 2009-0009-DWQ). In order to obtain coverage under the Construction General Permit, a project-specific Stormwater Pollution Prevention Plan (SWPPP) must be prepared. The SWPPP outlines BMPs to reduce stormwater and non-stormwater pollutant discharges, including erosion control, minimizing contact between construction materials and precipitation, and strategies to prevent equipment leakage or spills.

### *California Public Resources Code, Section 5097.5*

PRC Section 5097.5 defines as a misdemeanor the unauthorized disturbance or removal of archaeological, historic, or paleontological resources located on public lands.

### *CSU Seismic Requirements*

The CSU Seismic Requirements were established to implement Seismic Policy set by the Board of Trustees. The CSU Seismic Policy applies to all buildings and structures within a CSU campus. All facilities must be evaluated according to the “Standards for Acquiring Buildings and Space.” Planning for all projects included in the Campus Master Plan should address the options considered to improve seismic performance beyond minimally required code performance (CSU 2016).

## 4.6.3 Impact Analysis

### **a. Thresholds of Significance**

To determine whether a project would result in a significant impact to Geology and Soils, Appendix G of the CEQA Guidelines requires consideration of whether a project would:

1. Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area; strong seismic ground shaking; seismic-related ground failure, including liquefaction; or landslides;
2. Result in substantial soil erosion or the loss of topsoil;

3. Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse;
4. Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994), creating substantial risks to life or property;
5. Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater; or
6. Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature.

## b. Methodology

To evaluate Campus Master Plan impacts, resource conditions that could pose a risk to development of the Campus Master Plan were identified through review of documents pertaining to these topics. Sources consulted include the County of Orange General Plan and The Fullerton Plan, U.S. Geological Survey and California Geological Survey technical maps and guides; the Natural Resources Conservation Service Soil Survey (available through the Soil Survey Geographic Database); previous EIRs; background reports prepared for nearby plans and projects; and published geologic literature. The information obtained from these sources was reviewed and summarized to establish the existing conditions (described above) and identify potential environmental hazards. In determining level of significance, the analysis assumes that the Campus Master Plan would comply with relevant laws, regulations, and guidelines.

## c. Impact Analysis

- Threshold 1a:** Would the project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault?
- Threshold 1b:** Would the project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving strong seismic ground shaking?
- Threshold 1c:** Would the project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving seismic-related ground failure, including liquefaction?
- Threshold 1d:** Would the project directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving landslides?

**IMPACT GEO-1** THE CAMPUS IS NOT LOCATED IN AN ALQUIST-PRIOLO FAULT ZONE AND NO FAULT LINES TRAVERSE DIRECTLY UNDER THE SITE. THERE IS POTENTIAL FOR BOTH EARTHQUAKES AND GROUNDSHAKING IN THE PROJECT AREA. THIS IS A POTENTIALLY SIGNIFICANT IMPACT THAT CAN BE REDUCED TO LESS THAN SIGNIFICANT WITH MITIGATION. ~~IMPACTS WOULD BE LESS THAN SIGNIFICANT. NO MITIGATION MEASURES ARE REQUIRED.~~

The southern California region is considered to be seismically active. However, CSUF is not directly located in an Alquist-Priolo Fault Zone and does not contain any known fault lines as shown on

CGS's La Habra Quadrangle map and on Exhibit 26, *Ground Shaking Potential*, in the City of Fullerton General Plan Natural Environment Element (CGS 2016; City of Fullerton 2012). The campus would be subject to ground shaking generated from regional fault activities from the Whittier Fault approximately four miles northeast, and the Peralta Hills and El Modeno faults approximately 4.5 miles southeast, which have the potential to cause moderate to large earthquakes (CGS 2015).

Master Plan implementation would include the replacement, renovation, and construction of new student housing and student support facilities as described in Section 2, *Project Description*. The projects proposed under the Campus Master Plan would be required to comply with the CSU Seismic Requirements and the latest CBC, to ensure that all new and modified buildings would be capable of withstanding anticipated levels of ground shaking. The CSU Seismic Requirements mandate the preparation of a site-specific geotechnical investigation using campus-specific 'seismic ground motion parameters' for all future development on campus. These parameters supersede CBC requirements in new construction. Thus, compliance with CSU Seismic Requirements and CBC would reduce the potential impact related to seismic ground shaking to less than significant.

## Mitigation Measures

### GEO-1 Perform Site Specific Geotechnical Investigation

A site-specific geotechnical investigation shall be performed for each future development or redevelopment project proposed under the Campus Master Plan. Appropriate stabilization and site design recommendations, or low impact development features determined necessary to support proposed development shall be incorporated in the project design and implemented as part of project construction. Examples of stabilization and erosion control recommendations may include. But are not limited to:

- Installation of earthen buttress(es);
- Excavation of landslide mass/material;
- Slope stabilization through excavation into bench and/or keyways and other methods;
- Deep soil mixing;
- Installation of retaining walls;
- Use of tie-back anchors, micropiles or shear pins; or
- A combination of any of these methods

~~No mitigation is required.~~

## Significance After Mitigation

Impacts would be less than significant without mitigation.

<b>Threshold 2:</b> Would the project result in substantial soil erosion or the loss of topsoil?
--

**IMPACT GEO-2** THE CAMPUS WOULD BE SUBJECT TO POTENTIAL EROSION OF TOPSOIL DURING TEMPORARY CONSTRUCTION ACTIVITIES. ALL CONSTRUCTION WOULD BE SUBJECT TO FOLLOW SWRCB'S CONSTRUCTION REQUIREMENTS AND PROJECTS INVOLVING MORE THAN ONE ACRE OF GROUND DISTURBANCE WOULD BE REQUIRED TO PREPARE A SWPPP. ADDITIONALLY, CSUF IS LOCATED ON BUILT-OUT, FLAT TOPOGRAPHY. GIVEN THESE CONDITIONS AND WITH REGULATORY COMPLIANCE, SUBSTANTIAL SOIL EROSION

**OF TOPSOIL IS NOT ANTICIPATED TO OCCUR. IMPACTS WOULD BE LESS THAN SIGNIFICANT. NO MITIGATION MEASURES ARE REQUIRED.**

---

Construction activities associated with the development of the Campus Master Plan would likely require ground-disturbing activities, such as grading and excavation, which could result in erosion and loss of topsoil, particularly if soils are exposed to wind or stormwater during construction. However, all new development within the Campus Master Plan would be required to comply with the SWRCB's General Permit for Discharges of Stormwater Associated with Construction Activity (Construction General Permit Order 2009-0009-DWQ). Additionally, all future development that would result in more than one acre of ground disturbance would be required to prepare a SWPPP. The SWPPP would include site-specific BMPs that would be implemented to prevent erosion and stormwater runoff and would include applicable monitoring programs to be implemented as necessary (see Section 4.13, *Effects Found Not to be Significant*, for additional discussion related to stormwater runoff).

Additionally, CSUF and vicinity are completely built-out with relatively flat topography. Therefore, conditions that contribute to substantial soil erosion or loss of topsoil are not present within the campus. The topography and drainage of the campus are anticipated to remain the same under the Campus Master Plan since renovations and construction of new buildings would occur within the campus's existing footprint. With compliance to the SWRCB's Construction General Permit Order 2009-0009-DQWQ and the development of a SWPPP, impacts would be less than significant.

### Mitigation Measures

No mitigation is required.

### Significance After Mitigation

Impacts would be less than significant without mitigation.

<p><b>Threshold 3:</b> Would the project be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse?</p>
<p><b>Threshold 4:</b> Would the project be located on expansive soil, as defined in Table 1-B of the Uniform Building Code (1994), creating substantial direct or indirect risks to life or property?</p>

**IMPACT GEO-3 CSUF IS NOT LOCATED IN A ZONE SUSCEPTIBLE TO LANDSLIDES, SUBSIDENCE, LATERAL SPREADING OR COLLAPSE. HOWEVER, THE NORTHERN PORTION OF CAMPUS IS LOCATED IN A ZONE OF LIQUEFACTION. THE CAMPUS OVERLIES MOCHO LOAM SOIL, WHICH HAS LOW EROSION HAZARD AND POTENTIALLY EXPANSIVE PROPERTIES. THE DEVELOPMENT OF CAMPUS MASTER PLAN PROJECTS WOULD BE REQUIRED TO COMPLY WITH BUILDING STANDARDS CONTAINED IN THE UBC, DIVISION OF THE STATE ARCHITECT (DSA), AND CGS, AS WELL AS COMPLY WITH THE CSU SEISMIC REQUIREMENTS. IMPACTS WOULD BE LESS THAN SIGNIFICANT. NO MITIGATION MEASURES ARE REQUIRED.**

---

According to the U.S. Department of Agriculture (USDA) soil survey, the predominant soil unit mapped within the CSUF campus boundary is the Mocho loam, which generally occurs in alluvial fans or flood plains, has low erosion hazard, and expansive properties (USDA 2019). However, projects under the Campus Master Plan would comply with applicable regulations set forth by the

UBC, Division of the State Architect (DSA), and CGS, which would minimize risks to life and property in relation to expanding soils.

Implementation of the Campus Master Plan would include the construction of new facilities as well as replacement of existing facilities within the Campus Master Plan area, which could potentially occur within areas that consist of expansive soils. However, development associated with the Campus Master Plan would be constructed on existing developed land and would not be subject to changes in soil type than what is already existing on the campus. Additionally, all structures proposed to be constructed or redeveloped under the Campus Master Plan would be required to comply with the CSU Seismic Requirements and the latest CBC, to ensure structural design of all new and modified buildings would not result in adverse effects such on- or off-site landslides, lateral spreading, subsidence, liquefaction, or collapse. Therefore, impacts associated with expansive or unstable soils would be less than significant.

### Mitigation Measures

No mitigation measures are required.

### Significance After Mitigation

Impacts would be less than significant.

<b>Threshold 5:</b> Would the project have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater?
---

Threshold 5 is fully analyzed under Section 4.13, *Effects Found Not to Be Significant*. Additionally, the use of septic tanks and wastewater systems is fully analyzed under Section 4.12, *Utilities and Service Systems*.

<b>Threshold 6:</b> Would the project directly or indirectly destroy a unique paleontological resource or site or unique geologic feature?
--

**IMPACT GEO-4** THE CAMPUS IS UNDERLAIN BY GEOLOGIC UNITS POSSESSING PALEONTOLOGICAL SENSITIVITY RANGING FROM LOW TO HIGH. POTENTIAL FOR PALEONTOLOGICAL RESOURCES MAY OCCUR DURING GROUND-DISTURBING ACTIVITIES FOR CERTAIN PROJECTS. MITIGATION MEASURES HAVE BEEN IDENTIFIED TO REDUCE IMPACTS IN THE EVENT OF AN UNANTICIPATED DISCOVERY OF PALEONTOLOGICAL RESOURCES. THIS IS A POTENTIALLY SIGNIFICANT IMPACT THAT CAN BE REDUCED TO LESS THAN SIGNIFICANT WITH MITIGATION.

A Paleontological Resources Assessment (PRA) was completed by Rincon Consultants, Inc., dated July 2019, and is included as Appendix J to this EIR. The analysis included in the PRA is based on a fossil locality record search at the National History Museum of Los Angeles County (NHMLAC), and review of existing geologic maps and primary literature regarding fossiliferous geologic units within the campus and vicinity. No previously recorded fossil locations were identified for the campus. CSUF is completely developed and projects proposed under the Campus Master Plan would occur within the boundaries of the campus on previously disturbed areas.

Based on the findings of the NHMLAC, the campus includes underlying geologic units that have a paleontological sensitivity ranging from low to high (Appendix K). Younger Quaternary alluvial deposits mapped at the surface were determined to have low paleontological sensitivity. However,

the underlying Pleistocene deposits or La Habra Formations, approximately eight feet below the ground surface (bgs), were determined to have high sensitivity. Therefore, disturbance of potential paleontological resources may occur during ground-disturbing activities at depths beyond eight feet bgs. A significant impact on paleontological resources could result if an inadvertent discovery is made during ground-disturbing activities associated with construction of projects under the Campus Master Plan. Therefore, the impact on paleontological resources would be potentially significant.

## Mitigation Measures

### *GEO-1 Perform Site Specific Geotechnical Investigation*

~~A site-specific geotechnical investigation shall be performed for each future development or redevelopment project proposed under the Campus Master Plan. Appropriate stabilization and site design recommendations, or low impact development features determined necessary to support proposed development shall be incorporated in the project design and implemented as part of project construction. Examples of stabilization and erosion control recommendations may include. But are not limited to:~~

- ~~▪— Installation of earthen buttress(es);~~
- ~~▪— Excavation of landslide mass/material;~~
- ~~▪— Slope stabilization through excavation into bench and/or keyways and other methods;~~
- ~~▪— Deep soil mixing;~~
- ~~▪— Installation of retaining walls;~~
- ~~▪— Use of tie back anchors, micropiles or shear pins; or~~
- ~~▪— A combination of any of these methods~~

### *GEO-2 Retain a Qualified Paleontologist*

Prior to the commencement of ground-disturbing activities, a qualified professional paleontologist shall be retained to review all project plans where ground disturbance is expected to extend to or below eight feet bgs within areas mapped as Holocene alluvial deposits (Qa) to determine if underlying paleontologically sensitive units (i.e., Pleistocene age deposits or the La Habra Formation) could be impacted. If potentially significant impacts are identified, the qualified professional paleontologist shall prepare and implement a Paleontological Resources Mitigation Plan (PRMP). A Qualified Paleontologist is an individual who meets the education and professional experience standards as set forth by the Society of Vertebrate Paleontology (SVP) (2010), which recommends the paleontologist shall have at least a Master's Degree or equivalent work experience in paleontology, shall have knowledge of the local paleontology, and shall be familiar with paleontological procedures and techniques. The PRMP shall describe mitigation recommendations in detail, including paleontological monitoring procedures; communication protocols to be followed in the event that an unanticipated fossil discovery is made during project development; and preparation, curation, and reporting requirements.

### *GEO-3 Paleontological Worker Environmental Awareness Program (WEAP)*

Prior to the start of construction, the Qualified Paleontologist or his or her designee shall conduct training for construction personnel regarding the appearance of fossils and the procedures for notifying paleontological staff should fossils be discovered by construction staff. The WEAP shall be fulfilled at the time of a preconstruction meeting. In the event a fossil is discovered by construction

personnel anywhere in the campus, all work in the immediate vicinity of the find shall cease and a qualified paleontologist shall be contacted to evaluate the find before re-starting work in the area. If it is determined that the fossil(s) is (are) scientifically significant, the qualified paleontologist shall complete the mitigation outlined below to mitigate impacts to significant fossil resources.

#### *GEO-4 Paleontological Monitoring*

Initially, full-time monitoring shall be conducted during ground construction activities (i.e., grading, trenching, foundation work, and other excavations) in areas where ground disturbance would occur at or below eight feet bgs within intact Holocene deposits. Monitoring shall be conducted by a qualified paleontological monitor, who is defined as an individual who meets the minimum qualifications per standards set forth by the SVP (2010), which includes a B.S. or B.A. degree in geology or paleontology with one year of monitoring experience and knowledge of collection and salvage of paleontological resources. The duration and timing of the monitoring shall be determined by the Qualified Paleontologist and the location and extent of proposed ground disturbance. If the Qualified Paleontologist determines that full-time monitoring is no longer warranted, based on the specific geologic conditions at the surface or at depth, the Qualified Paleontologist may recommend that monitoring be reduced to periodic spot-checking or cease entirely.

#### *GEO-5 Fossil Discovery, Preparation, and Curation*

If a paleontological resource is discovered, the monitor shall have the authority to temporarily divert the construction equipment around the find until it is assessed for scientific significance and collected. Typically, fossils can be safely salvaged quickly by a single paleontologist and not disrupt construction activity. In some cases, larger fossils (such as complete skeletons or large mammals) require more extensive excavation and longer salvage periods. In this case, the paleontologist should have the authority to temporarily direct, divert or halt construction activity to ensure that the fossil(s) can be removed in a safe and timely manner.

Once salvaged, significant fossils shall be identified to the lowest possible taxonomic level, prepared to a curation-ready condition and curated in a scientific institution with a permanent paleontological collection (such as the NHMLAC) along with all pertinent field notes, photos, data, and maps.

#### *GEO-6 Final Paleontological Mitigation Report*

At the conclusion of laboratory work and museum curation, a final report shall be prepared describing the results of the paleontological mitigation monitoring efforts associated with the project. The report shall include a summary of the field and laboratory methods, an overview of the project geology and paleontology, a list of taxa recovered (if any), an analysis of fossils recovered (if any) and their scientific significance, and recommendations. The final report shall be submitted to the CSUF. If the monitoring efforts produced fossils, then a copy of the report shall also be submitted to the designated museum repository.

### **Significance After Mitigation**

Impacts would be less than significant with mitigation incorporated.

*This page intentionally left blank.*

## 4.7 Noise

---

This section analyzes the temporary noise impacts related to construction activity and long-term noise impacts associated with the operation of the Campus Master Plan.

### 4.7.1 Environmental Setting

#### Overview of Sound Measurement

Sound is a vibratory disturbance created by a moving or vibrating source, which is capable of being detected by the hearing organs. Noise is defined as sound that is loud, unpleasant, unexpected, or undesired and may therefore be classified as a more specific group of sounds. The effects of noise on people can include general annoyance, interference with speech communication, sleep disturbance, and, in the extreme, hearing impairment (Caltrans 2013a).

Noise levels are commonly measured in decibels (dB) using the A-weighted sound pressure level (dBA). The A-weighting scale is an adjustment to the actual sound pressure levels so that they are consistent with the human hearing response, which is most sensitive to frequencies around 4,000 Hertz (Hz) and less sensitive to frequencies around and below 100 Hz (Kinsler, et. al. 1999). Decibels are measured on a logarithmic scale that quantifies sound intensity in a manner similar to the Richter scale used to measure earthquake magnitudes. A doubling of the energy of a noise source, such as doubling of traffic volume, would increase the noise level by 3 dBA; reducing the energy in half would result in a 3 dBA decrease (Crocker 2007).

Human perception of noise has no simple correlation with sound energy: the perception of sound is not linear in terms of dBA or in terms of sound energy. Two sources do not “sound twice as loud” as one source. It is widely accepted that the average healthy ear can barely perceive changes of 3 dBA, increase or decrease (i.e., twice the sound energy); that a change of 5 dBA is readily perceptible (8 times the sound energy); and that an increase (or decrease) of 10 dBA sounds twice (half) as loud (10.5 times the sound energy) (Crocker 2007).

Sound changes in both level and frequency spectrum as it travels from the source to the receiver. The most obvious change is the decrease in level as the distance from the source increases. The manner in which noise reduces with distance depends on factors such as the type of sources (e.g., point or line, the path the sound will travel, site conditions, and obstructions). Noise levels from a point source typically attenuate, or drop off, at a rate of 6 dBA per doubling of distance (e.g., construction, industrial machinery, ventilation units). Noise from a line source (e.g., roadway, pipeline, railroad) typically attenuates at about 3 dBA per doubling of distance (Caltrans 2013a). The propagation of noise is also affected by the intervening ground, known as ground absorption. A hard site, such as a parking lot or smooth body of water, receives no additional ground attenuation and the changes in noise levels with distance (drop-off rate) result from simply the geometric spreading of the source. An additional ground attenuation value of 1.5 dBA per doubling of distance applies to a soft site (e.g., soft dirt, grass, or scattered bushes and trees) (Caltrans 2013a). Noise levels may also be reduced by intervening structures; the amount of attenuation provided by this “shielding” depends on the size of the object and the frequencies of the noise levels. Natural terrain features such as hills and dense woods, and man-made features such as buildings and walls, can significantly alter noise levels. Generally, any large structure blocking the line of sight will provide at least a 5-dBA reduction in source noise levels at the receiver (Federal Highway Administration [FHWA] 2017). Structures can substantially reduce exposure to noise as well. The FHWA’s guidelines indicate

that modern building construction generally provides an exterior-to-interior noise level reduction of 20 to 35 dBA with closed windows.

The impact of noise is not a function of loudness alone. The time of day when noise occurs and the duration of the noise are also important factors of Campus Master Plan noise impact. Most noise that lasts for more than a few seconds is variable in its intensity. Consequently, a variety of noise descriptors have been developed. One of the most frequently used noise metrics is the equivalent noise level ( $L_{eq}$ ); it considers both duration and sound power level.  $L_{eq}$  is defined as the single steady A-weighted level equivalent to the same amount of energy as that contained in the actual fluctuating levels over time. Typically,  $L_{eq}$  is summed over a one-hour period.  $L_{max}$  is the highest root-mean-square (RMS) sound pressure level within the sampling period, and  $L_{min}$  is the lowest RMS sound pressure level within the measuring period (Crocker 2007).

Noise that occurs at night tends to be more disturbing than that occurring during the day. Community noise is usually measured using Day-Night Average Level ( $L_{dn}$ ), which is the 24-hour average noise level with a +10 dBA penalty for noise occurring during nighttime (10:00 p.m. to 7:00 a.m.) hours; it is also measured using Community Noise Equivalent Level (CNEL), which is the 24-hour average noise level with a +5 dBA penalty for noise occurring from 7:00 p.m. to 10:00 p.m. and a +10 dBA penalty for noise occurring from 10:00 p.m. to 7:00 a.m. (Caltrans 2013a). Noise levels described by  $L_{dn}$  and CNEL usually differ by about 1 dBA. The relationship between the peak-hour  $L_{eq}$  value and the  $L_{dn}$ /CNEL depends on the distribution of traffic during the day, evening, and night. Quiet suburban areas typically have CNEL noise levels in the range of 40 to 50 dBA, while areas near arterial streets are in the 50 to 60-plus CNEL range. Normal conversational levels are in the 60 to 65-dBA  $L_{eq}$  range; ambient noise levels greater than 65 dBA  $L_{eq}$  can interrupt conversations (Federal Transit Administration [FTA] 2018).

## Vibration

Groundborne vibration of concern in environmental analysis consists of the oscillatory waves that move from a source through the ground to adjacent structures. The number of cycles per second of oscillation makes up the vibration frequency, described in terms of Hz. The frequency of a vibrating object describes how rapidly it oscillates. The normal frequency range of most groundborne vibration that can be felt by the human body starts from a low frequency of less than 1 Hz and goes to a high of about 200 Hz (Crocker 2007).

While people have varying sensitivities to vibrations at different frequencies, in general they are most sensitive to low-frequency vibration. Vibration in buildings, such as from nearby construction activities, may cause windows, items on shelves, and pictures on walls to rattle. Vibration of building components can also take the form of an audible low-frequency rumbling noise, referred to as groundborne noise. Groundborne noise is usually only a problem when the originating vibration spectrum is dominated by frequencies in the upper end of the range (60 to 200 Hz), or when foundations or utilities, such as sewer and water pipes, physically connect the structure and the vibration source (FTA 2018). Although groundborne vibration is sometimes noticeable in outdoor environments, it is almost never annoying to people who are outdoors. The primary concern from vibration is that it can be intrusive and annoying to building occupants and vibration-sensitive land uses.

Vibration energy spreads out as it travels through the ground, causing the vibration level to diminish with distance away from the source. High-frequency vibrations diminish much more rapidly than low frequencies, so low frequencies tend to dominate the spectrum at large distances from the source. Discontinuities in the soil strata can also cause diffractions or channeling effects that affect

the propagation of vibration over long distances (Caltrans 2013b). When a building is impacted by vibration, a ground-to-foundation coupling loss will usually reduce the overall vibration level. However, under rare circumstances, the ground-to-foundation coupling may actually amplify the vibration level due to structural resonances of the floors and walls.

Vibration amplitudes are usually expressed in peak particle velocity (PPV) or RMS vibration velocity. The PPV and RMS velocity are normally described in inches per second. PPV is defined as the maximum instantaneous positive or negative peak of a vibration signal. PPV is often used in monitoring of blasting vibration because it is related to the stresses that are experienced by buildings (Caltrans 2013b).

### Existing Noise Setting

The site is located in an urban, developed area. Nearby land uses include commercial uses and single- and multi-family residences located in surrounding neighborhoods. The primary sources of noise on-site and in the surrounding area are motor vehicles from nearby roadways; the greatest vehicle noise would occur from vehicles on the main thoroughfares (SR 57, North State College Boulevard, Nutwood Avenue, and Yorba Linda Boulevard).

To evaluate existing noise levels in the area, five 15-minute noise measurements (ST1 through ST5) and one 24-hour noise measurements (LT1) were taken on and near the Campus Master Plan site on October 10 and 11, 2019, using ANSI Type II integrating sound level meters. Figure 4.7-1 shows the locations of the noise measurements. The noise measurement locations were chosen to provide a representative range of ambient noise levels across the Campus Master Plan site and in the nearby area, especially near existing noise-sensitive residences and roadways. The short-term noise measurement results are shown in Table 4.7-1 and the long-term results are shown in Table 4.7-2. Traffic counts for the short-term noise measurements are shown in Table 4.7-3. Detailed noise meter outputs are included in Appendix L.

**Table 4.7-1 Campus Master Plan Vicinity Sound Level Monitoring Results**

Measurement	Measurement Location	Sample Times <sup>1</sup>	Approximate Distance to Primary Noise Source	Leq (dBA)	Lmin (dBA)	Lmax (dBA)
1	N. State College Boulevard, near campus police station	8:51 – 9:06 a.m.	60 feet to centerline of North State College Boulevard	68.1	46.5	96.5
2	Yorba Linda Boulevard	9:32 – 9:47 a.m.	60 feet to centerline of Yorba Linda Boulevard	66.3	49.9	80.0
3	East Campus Drive, near SR 57	10:08 – 10:23 a.m.	180 feet to centerline of SR 57	62.1	57.0	74.0
4	Nutwood Avenue	11:04 – 11:19 a.m.	70 feet to centerline of East Clark Avenue	63.4	48.5	74.9
5	East Commonwealth Avenue (residential neighborhood)	9:32 a.m. – 9:47 a.m.	35 feet to centerline of East Commonwealth Avenue	65.5	45.3	85.0

<sup>1</sup> Measurements 1 through 4 taken on October 10, 2019; Measurement 5 taken on October 11, 2019.

See Figure 4.7-1 for Noise Measurement Locations.

Detailed sound level measurement data are included in Appendix L.

		<b>Percentage</b>	<b>97%</b>	<b>2%</b>	<b>1%</b>
5	East Commonwealth Avenue	15-minute count	66	3	1
		one-hour equivalent	264	12	4
		<b>Percentage</b>	<b>94%</b>	<b>4%</b>	<b>2%</b>

<sup>1</sup>Traffic was not counted for Measurement 3, as the main source of noise, SR 57 traffic, was not visible due to the elevated freeway location.

Detailed sound level measurement data are included in Appendix L.

Figure 4.7-1 Noise Measurement Locations

## Sensitive Receptors

Noise exposure goals for various types of land uses reflect the varying noise sensitivities associated with those uses. Noise sensitive uses typically includes single- and multi-family residential, churches, hospitals and similar health care institutions, convalescent homes, libraries, and schools.

Vibration sensitive receivers are similar to noise sensitive receivers, such as residences and institutional uses (e.g., schools, libraries, and religious facilities).

### 4.7.2 Regulatory Setting

#### Federal

No federal noise requirements or regulations apply directly to the implementation of the Campus Master Plan, but federal agencies have established guidelines and thresholds pertaining to noise and groundborne vibration as they relate to land use compatibility, human response, and structural integrity. These thresholds, as applicable, are discussed below in Section 4.7.2, *Impact Analysis*.

##### *Federal Transit Administration Ground borne Vibration Guidelines*

Sections 5 and 6 of the Transit Noise and Vibration Impact Assessment Manual, adopted by the FTA in September 2018, addresses the federal guidelines used to evaluate a project for potential vibration impacts. The vibration impact analysis is a multi-step process used for determining vibration analysis level, determining vibration impact criteria, and evaluating vibration impact. FTA guidelines state that the threshold of perception for humans is approximately 65 vibration decibels (VdB). A vibration level of 85 VdB can result in strong annoyance, and a vibration level of 100 VdB is the threshold of potential damage (FTA 2018). Construction activity can result in varying degrees of ground vibration depending on the equipment and methods employed, and older and more fragile buildings must receive special consideration. These guidelines are advisory and should be used to assess the impacts of ground borne vibrations created from transit and construction sources.

#### State

##### *California Building Code*

CCR Title 24, Building Standards Administrative Code, Part 2, and the California Building Code codify the state noise insulation standards. These noise standards apply to new construction in California to control interior noise levels as they are affected by exterior noise sources. The regulations specify that interior noise levels for residential and school land uses should not exceed 45 dBA CNEL.

##### *California General Plan Guidelines*

The California General Plan Guidelines, published by the Governor's Office of Planning and Research, indicate acceptable, specific land use types in areas with specific noise exposure. The guidelines also offer adjustment factors that may be used to arrive at noise acceptability standards that reflect the noise control goals of the community, the particular community's sensitivity to noise, and the community's assessment of the relative importance of noise pollution. These guidelines are advisory, and local jurisdictions, including the City of Fullerton, have the responsibility to set specific noise standards based on local conditions. Please refer to the discussion below, under *The Fullerton Plan*, for the compatibility guidelines adopted by the City of Fullerton.

### *Caltrans Ground Borne Vibration Guidelines*

The Transportation and Construction Vibration Guidance Manual provides guidance on vibration issues associated with the construction, operation, and maintenance of Caltrans projects. These guidelines address vibration criteria and establish thresholds for vibration-related annoyance to people, vibration-related damage to structures, and vibration-related adverse effects to sensitive equipment. Vibration impact criteria developed by the FTA indicates minimum thresholds of impact for different land uses. Minimum vibration thresholds are: 65 VdB for buildings where low ambient vibration is essential for interior operations, 72 VdB for residences and buildings where people normally sleep, and 75 VdB for institutional land uses with primarily daytime uses. Historic and fragile buildings are particularly susceptible to damage caused vibration. Caltrans suggests limiting PPV (in/sec) to 0.5 for historic and old buildings and residences (Caltrans 2013). This manual also addresses vibration prediction and screening assessment for construction equipment, methods that can be used to reduce vibration effects from transportation and construction sources, general procedures for addressing vibration issues, and vibration measurement and instrumentation. Guidelines and procedures provided in this manual should be treated as screening tools for assessing the potential for adverse effects related to human perception and structural damage.

### *California State University*

#### *California State University, Fullerton Hearing Conservation Program*

CSUF has established a Hearing Conservation Program to maintain effective control over the harmful effects of excessive noise on students and employees (CSUF 2018). The CSUF Hearing Conservation Program states the following:

It is the policy of California State University, Fullerton to establish and maintain effective noise control and hearing conservation programs designed to eliminate or control, in so far as is reasonable and practical, overexposure of students, faculty, and staff to harmful noise. The University shall identify noisy areas on campus and shall take steps to protect personnel who work in these areas. When noise cannot be controlled by engineering and administrative controls, the University shall distribute hearing protectors to all employees exposed to an 8-hour time-weighted average noise level of 85 decibels or greater. Under certain conditions, employees shall be required to use hearing protection. The University shall provide, at no cost to employees involved in this program, a hearing program designed to provide information of satisfactory maintenance of employee hearing levels and to ascertain the effectiveness of noise control methods. The purpose of this program is to establish a coordinated approach toward controlling excessive occupational noise exposure as directed by University policy and State law. Authority is given to CSUF through Title 8, Sections 5095 to 5100 of the California Code of Regulations and Title 29, Section 1910.95 of the Code of Federal Regulations.

Furthermore, the Program requires the following:

- Environmental Health and Safety (EHS)
  - Coordinate the campus Hearing Conservation Program, providing consultation to departments according to their specific needs.
  - Conduct personal noise dosimetry to determine time-weighted average (TWA) exposures for individuals and departments.
  - Conduct noise surveys in response to department requests or as a general noise survey.

- Assist departments in developing methods for noise abatement, reduction or control.
- Purchase personal protective devices.
- Establish and conduct an audiometric testing program for affected employees, providing consultation and notification of exam results.
- Maintain and make available records of exposure measurements and audiometric tests.
- Maintain training records.
- Departments
  - Ensure that noise control is considered when procuring equipment, machinery, and tools.
  - Identify work areas that may overexpose employees to harmful levels of noise and notify the EHS Office.
  - Develop methods for noise abatement, reduction, or control.
  - Train or arrange training for employees covered by the Hearing Conservation Program; ensure that they read, understand and comply with all appropriate procedures.
  - Ensure that appropriate personal protective equipment is provided to affected employees; enforce the use of such devices when required; ensure that such devices are kept in good repair and maintained in a sanitary manner.
- New employees assigned to work in areas listed above shall be sent to EHS for a baseline audiogram or personal exposure assessments within the first two weeks of their assignment.
- When workers are exposed to an 8-hour time-weighted average [TWA of 85 decibels (dBA)] or greater, the University must institute a hearing conservation program. This program includes monitoring of workplace noise, an audiometric testing program for all exposed workers and an expert evaluation of the test results

*California State University, Fullerton Student housing Policies*

Student Housing Policies within CSU Housing and Residential Engagement states the following:

Quiet Hours are Sunday through Thursday (10 p.m. to 8 a.m.) and Friday and Saturday (12 a.m. to 10 a.m.). Quiet Hours also extend to the public areas (i.e. basketball and volleyball courts) and outdoor areas as well as balconies/patios, study rooms, lounges, and student rooms. Each semester beginning at 5 p.m. on the last Friday of classes, through 5 p.m. on the Saturday of finals week, a 24-Hour Quiet Hour policy is in effect. It is during these hours that students should avoid any loud talking or disturbance. Keep TV and stereos at low volume (headsets are suggested for other than low volume use). Courtesy Hours refers to any time during which quiet hours are not in effect. The right to study and/or sleep supersedes the right to be noisy. Courtesy Hours allow residents the authority to ask other community members to comply with their request to study and/or sleep. Students who continually violate quiet hours may be asked to remove the equipment which is causing the disturbance from Housing and Residential Engagement or they may have their Student Housing License Agreement cancelled. Authority is given to CSUF through Title 5, Section 41301 of the California Code of Regulations.

Although CSUF is not subject to standards from The Fullerton Plan or the City's Municipal Code, in lieu of CSU standards, CSUF has determined that the applicable local ordinances for the City of Fullerton shall be used to determine impacts.

## Regional and Local

CSUF, as a State entity, is not subject to municipal regulations of local governments for uses on property owned or controlled by CSUF that are in furtherance of the University's education purposes. However, CSUF may consider, for coordination purposes, aspects of local plans and policies for the communities surrounding the campus when it is appropriate and feasible, but it is not bound by those plans and policies in its planning efforts. Therefore, this EIR considers City of Fullerton plans and policies for informational purposes only.

### *The Fullerton Plan*

The Fullerton Plan is the City's governance tool focused on achieving the "Fullerton Vision" (City of Fullerton 2012). The Noise Element in The Fullerton Plan aims to achieve acceptable noise levels throughout the City. The Element provides a basis to control and abate environmental noise in the City and protect residents from unhealthy noise exposure. The Fullerton Plan includes the following goals and policies that apply to the Campus Master Plan:

**Goal 8:** Protection from the adverse effects of noise.

**Policy 8.2:** Support projects, programs, policies and regulations to control and abate noise generated by mobile sources.

**Policy 8.3:** Support projects, programs, policies and regulations which ensure noise-compatible land use planning recognizing the relative importance of noise sources in order of community impact, the local attitudes towards these sources, and the suburban or urban characteristics of the environment, while identifying noise sensitive uses.

**Policy 8.4:** Support projects, programs, policies and regulations to control and abate noise generated by stationary sources.

**Policy 8.6:** Support projects, programs, policies and regulations to permit uses where the noise level of the surroundings—after taking into account noise insulation features and other control techniques of the use—is not detrimental to the use.

**Policy 8.7:** Support projects, programs, policies and regulations to permit uses and/or activities where the noise generated by the use and/or activity is not detrimental or otherwise a nuisance to the surroundings.

Table 8 of the Noise Element included below in Table 4.7-4, describes the noise level ranges considered compatible within the City of Fullerton for various land use types. These standards are typically used to ensure suitability of new land uses (such as new residential developments) but may also be used to ensure that existing land uses do not exceed a threshold (i.e., from acceptable to unacceptable) as a result of construction of a nearby proposed project. The Fullerton Plan does not specify interior noise standards.

**Table 4.7-4 Land Use Compatibility for Community Noise Exposure**

Land Use Category	Community Noise Exposure (dBA CNEL)			
	Normally Acceptable	Conditionally Acceptable	Normally Unacceptable	Conditionally Unacceptable
Residential – Low-Density, Single-Family, Duplex, Mobile Homes	50-60	55-70	70-75	75-95
Residential – Multiple-Family	50-65	60-70	70-75	70-85
Transient Lodging – Motel, Hotels	50-65	60-70	70-80	80-85
Schools, Libraries, Churches, Hospitals, Nursing Homes	50-70	60-70	70-80	80-85
Auditoriums, Concert Halls, Amphitheaters	N/A	50-70	N/A	65-85
Sports Arenas, Outdoor Spectator Sports	N/A	50-75	N/A	70-85
Playgrounds, Neighborhood Parks	50-70	N/A	67.5-77.5	72.5-85
Golf Courses, Riding Stables, Water Recreation, Cemeteries	50-70	N/A	70-80	80-85
Office Buildings, Business Commercial and Professional	50-70	67.5-77.5	75-85	N/A
Industrial, Manufacturing, Utilities, Agriculture	50-75	70-80	75-85	N/A

Source: Fullerton 2012

*City of Fullerton Municipal Code*

Chapter 15.90 of the City of Fullerton’s Municipal Code includes noise standards and regulations. Table 4.7-5 summarizes the noise standards for properties with residential zoning.

**Table 4.7-5 City of Fullerton Noise Standards**

Location	Time Period	Acceptable Noise Level (dBA) <sup>1</sup>
Exterior	Day (7 a.m. to 10 p.m.)	55
	Night (10 p.m. to 7 a.m.)	50
Interior	Day (7 a.m. to 10 p.m.)	55
	Night (10 p.m. to 7 a.m.)	45

Source: Fullerton Municipal Code Chapter 15.9045

<sup>1</sup> Standards apply to all property within a residential zone.

Chapter 15.90 also states the following regarding operational noise limits:

- Noise standards for a sensitive use:
  - a. A "sensitive use" for the purpose of this chapter means any private or public school, hospital, residential care facility for the elderly, and religious institution.
  - b. It shall be unlawful for any person at any location within the incorporated area of the city to create any noise that causes the noise level at any sensitive use, while the same is in operation to exceed the noise limits as specified for the Residential Noise Zone, notwithstanding the sensitive use may be located outside of the Residential Noise Zone.
- It shall be unlawful for any person at any location within the incorporated area of the city to create any noise which can be classified as being continuous, reoccurring, predictable, or whose operation of noise-generating capabilities can be stopped or started at a specified time, or to allow the creation of any noise on property owned, leased, occupied or otherwise controlled by such person, which causes the noise level, when measured on the property, either incorporated or unincorporated, to exceed:
  - a. Noise level standards for a cumulative period of more than 30 minutes within a 1-hour period.
  - b. Noise level standards plus 5 dBA for a cumulative period of more than 15 minutes but less than 30 minutes within a 1- hour period.
  - c. Noise level standards plus 10 dBA for a cumulative period of more than 5 minutes but less than 15 minutes within a 1- hour period.
  - d. Noise level standards plus 15 dBA for a cumulative period of more than one minute but less than 5 minutes within a 1- hour period.
  - e. Noise level standards plus 20 dBA for a cumulative period of less than one minute within a 1-hour period.
- In the event the ambient noise level exceeds any of the five noise limit categories listed above, the cumulative period applicable to the category shall be increased to reflect the ambient noise level.

In addition, Chapter 15.90 establishes allowable hours for construction activities. With the exception of emergency machinery or work, construction activities are allowable only on Monday through Saturday, 7:00 a.m. to 8:00 p.m. Construction activities are prohibited on Sunday and on City-recognized holidays. Construction equipment, vehicles, and work are exempt from the noise level standards in Table 4.7-5, provided that construction activities take place within the allowable time period.

Although construction activity is exempt from the noise standards shown above, for purposes of this analysis, the FTA Transit Noise and Vibration Impact Assessment (FTA 2018) criteria will be used. The FTA provides reasonable criteria for assessing construction noise impacts based on the potential for adverse community reaction. For residential uses, the daytime noise threshold is 80 dBA  $L_{eq}$  for an 8-hour period.

### 4.7.3 Impact Analysis

#### a. Thresholds of Significance

To determine whether a project would result in a significant noise impact, Appendix G of the CEQA Guidelines requires consideration of whether a project would:

1. Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the Campus Master Plan in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies;
2. Generation of excessive groundborne vibration or groundborne noise levels; and/or
3. For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the Campus Master Plan expose people residing or working in the project area to excessive noise levels.

#### b. Methodology

As state above, CSUF is not subject to standards from The Fullerton Plan or Municipal Code. To complete this analysis, in lieu of CSU standards, CSUF has determined that the applicable local ordinances for the City of Fullerton shall be used to determine impacts. The quantitative standards used for each threshold, described below, are based on the City of Fullerton standards and Appendix G of the CEQA Guidelines. Noise impacts would normally be considered significant if:

##### *Construction and Operational Noise*

- Construction noise occurs outside of the City of Fullerton permitted hours (Monday through Saturday, 7:00 a.m. to 8:00 p.m., or if construction occurs on Sunday and on City-recognized holidays.)
- Construction noise at residential land uses exceeds the FTA's criteria for construction noise impacts of 80 dBA  $L_{eq}$  for an 8-hour period.
- Operational noise exceeds the City of Fullerton's Municipal Code limits as specified in Table 4.7-5.
- For traffic-related noise, impacts would be considered significant if Campus Master Plan-generated traffic would result in exposure of sensitive receptors to an unacceptable increase in noise levels. For purposes of this analysis, a significant impact would occur if Campus Master Plan-related traffic increases the ambient noise environment of noise-sensitive locations by 3 dBA or more if the locations are subject to noise levels in excess of 70 CNEL for exterior areas or 45 CNEL for interior noise levels, or by 5 dBA or more if the locations are not subject to noise levels in excess of the aforementioned standards.

##### *Vibration*

- For human receivers, the vibration level threshold to determine significance is 0.24 in./sec. PPV, is the level at which transient vibration sources (such as construction equipment) are considered to be distinctly perceptible (Caltrans 2013b). For structures, based on AASHTO recommendations, the vibration level threshold to determine significance is 0.2 PPV in/sec.

### *Construction Noise*

Construction noise was estimated using the FHWA Roadway Construction Noise Model (RCNM) (FHWA 2006). RCNM predicts construction noise levels for a variety of construction operations based on empirical data and the application of acoustical propagation formulas. Using RCNM, construction noise levels were estimated at noise sensitive receivers near the Campus Master Plan site. RCNM provides reference noise levels for standard construction equipment, with an attenuation of 6 dBA per doubling of distance for stationary equipment.

Variation in power imposes additional complexity in characterizing the noise source level from construction equipment. Power variation is accounted for by describing the noise at a reference distance from the equipment operating at full power and adjusting it based on the duty cycle of the activity to determine the  $L_{eq}$  of the operation (FHWA 2018). Each phase of construction has a specific equipment mix, depending on the work to be accomplished during that phase. Each phase also has its own noise characteristics; some will have higher continuous noise levels than others, and some have high-impact noise levels.

For general construction activities, construction noise would typically be higher during the heavier periods of initial construction (i.e., site preparation and grading work) and would be lower during the later construction phases (i.e., interior building construction). Typical heavy construction equipment during Campus Master Plan project grading and site preparation would include bulldozers, excavators, front-end loaders, dump trucks, and graders. It is assumed that diesel engines would power all construction equipment. Construction equipment would not all operate at the same time or location due to the different tasks performed by each piece of equipment. In addition, construction equipment would not be in constant use during the 8-hour operating day. An excavator, loader, and dump truck were analyzed together for construction noise impacts due to their potential of being used in conjunction with one another and therefore a conservative scenario for the greatest noise generation during general construction activities. Using RCNM to estimate noise associated with construction equipment, maximum hourly noise levels are calculated to be 79.9 dBA  $L_{eq}$  at 50 feet (RCNM calculations are included in Appendix L).

Activities using impact devices such as pile drivers or breakers may also be used during Campus Master Plan construction. It is unknown at this stage of planning if these pieces of equipment would be required for construction of Campus Master Plan buildings. A pile driver could be used to drive foundation piles into the ground, and a breaker could be used to break up asphalt and concrete associated with demolition of existing buildings. These devices would typically operate separately from other equipment. Using RCNM to estimate noise associated with construction equipment, maximum hourly noise levels are calculated to be 94.3 dBA  $L_{eq}$  at 50 feet for an impact pile driver and 80.0 dBA  $L_{eq}$  for a breaker (RCNM Calculations are included in Appendix L).

### *Groundborne Vibration*

The proposed Campus Master Plan does not include any substantial vibration sources associated with operation. Therefore, construction activities have the greatest potential to generate ground-borne vibration affecting nearby receivers, especially during grading and excavation of the Campus Master Plan site. The greatest vibratory source during general Campus Master Plan construction activities would be a vibratory roller. An impact pile driver may be used during impact construction activities, if required. Construction vibration estimates are based on vibration levels reported by Caltrans and the FTA (Caltrans 2013b, FTA 2018). Table 4.7-6 shows typical vibration levels for various pieces of construction equipment used in the assessment of construction vibration (FTA 2018).

**Table 4.7-6 Vibration Levels Measured during Construction Activities**

Equipment	PPV at 25 ft. (in/sec)	
Pile Driver (impact)	Upper range	1.518
	Typical	0.644
Pile Driver (sonic)	Upper range	0.734
	Typical	0.170
Vibratory Roller		0.210

Source: FTA 2018

Vibration limits used in this analysis to determine a potential impact to nearby land uses from construction activities are based on information contained in Caltrans' *Transportation and Construction Vibration Guidance Manual* and the Federal Transit Administration and the FTA *Transit Noise and Vibration Impact Assessment Manual* (Caltrans 2013b; FTA 2018). Maximum recommended vibration limits by AASHTO are identified in Table 4.7-7.

**Table 4.7-7 AASHTO Maximum Vibration Levels for Preventing Damage**

Type of Situation	Limiting Velocity (in/sec)
Historic sites or other critical locations	0.1
Residential buildings, plastered walls	0.2–0.3
Residential buildings in good repair with gypsum board walls	0.4–0.5
Engineered structures, without plaster	1.0–1.5

Source: Caltrans 2013b

Based on AASHTO recommendations, limiting vibration levels to below 0.2 PPV in/sec at residential structures would prevent structural damage regardless of building construction type. These limits are applicable regardless of the frequency of the source. However, as shown in Table 4.7-8 and Table 4.7-9 potential human annoyance associated with vibration is usually different if it is generated by a steady state or a transient vibration source.

**Table 4.7-8 Human Response to Steady State Vibration**

PPV (in/sec)	Human Response
3.6 (at 2 Hz)–0.4 (at 20 Hz)	Very disturbing
0.7 (at 2 Hz)–0.17 (at 20 Hz)	Disturbing
0.10	Strongly perceptible
0.035	Distinctly perceptible
0.012	Slightly perceptible

Source: Caltrans 2013b

**Table 4.7-9 Human Response to Transient Vibration**

PPV (in/sec)	Human Response
2.0	Severe
0.9	Strongly perceptible
0.24	Distinctly perceptible
0.035	Barely perceptible

Source: Caltrans 2013b

As shown in Table 4.7-8, the vibration level threshold at which steady vibration sources are considered to be distinctly perceptible is 0.035 in/sec PPV. This is roughly equivalent to the FTA identified threshold of 78 VdB for assessing impacts to residential land uses from infrequent events. This threshold is used for assessing passing trains in the FTA Manual. However, as shown in Table 4.7-9, the vibration level threshold at which transient vibration sources (such as construction equipment) are considered to be distinctly perceptible is 0.24 in/sec PPV. This is roughly equivalent to 94 VdB. This analysis uses the distinctly perceptible threshold for purposes of assessing vibration impacts.

Although groundborne vibration is sometimes noticeable in outdoor environments, groundborne vibration is almost never annoying to people who are outdoors; the vibration level threshold for human perception is assessed at occupied structures (FTA 2018). Therefore, vibration impacts are assessed at the structure of an affected property.

### *Operational Noise Sources*

Noise sources associated with operation of the Campus Master Plan would include vehicular traffic, landscape maintenance, general site activities (e.g., students conversing), the event center, and mechanical equipment associated with buildings (e.g., HVAC units), speakers from the drive-through restaurants, and the car wash. Due to the distances and low noise levels associated with landscape maintenance and general site activities, these sources are not considered substantial noise generators and are not discussed further. In addition, as the event center is an indoor facility located within the campus interior, events held at the arena would not be noticeably audible at nearby noise-sensitive receivers and are not discussed further.

### **MECHANICAL EQUIPMENT**

Mechanical HVAC units associated with Campus Master Plan buildings would have the potential to generate noise levels that run continuously during the day and night. HVAC units are assumed to be installed on the rooftops of each building. Specific planning information is not available for the HVAC units at this time; modeling assumed the use of large rooftop units, Trane QuietCurb units, that can range from 20 to 130 tons. These units have a supply fan and can also have an exhaust fan. The supply fan's discharge and return generate a sound power level of 94.1 dBA and 89.4 dBA, respectively; the exhaust fan's return generates a sound power level of 97.1 dBA (the exhaust fan does not have a discharge fan). Manufacturer's specifications for the HVAC unit are included in Appendix L.

The largest individual building anticipated with Campus Master Plan construction would be the faculty housing building located in the southern portion of campus. Assuming all faculty housing is located in one-building, this would result in a building at an estimated 540,000 square feet. For this

analysis, it was assumed to be a six-story building. Due to the large building size, this building was considered in the analysis for a conservative estimate. A typical assumption for the amount of HVAC needed is one ton of HVAC for every 600 square feet of building space. Therefore, the faculty housing building is estimated to need 900 tons of HVAC. Assuming 130-ton HVAC units, seven HVAC units would be required.

On larger buildings, the HVAC units would potentially be spread throughout the rooftop. For the purposes of this analysis, it is assumed that up to four 130-ton HVAC units would be clustered in one area. It is also assumed that a cluster may be located near the edge of the building, which is a conservative assumption as this would place the HVAC units closer to the nearest noise sensitive receivers, when actual design may have the HVAC clusters located closer to the center of the building, further from the nearest noise-sensitive receivers. The units were conservatively assumed not to include noise attenuation provided by a parapet wall. All HVAC units were modeled operating at 100 percent during all hours; this is conservative as the HVAC units would likely not all be utilized simultaneously during the day and the use would be reduced at nighttime. In addition, the supply and exhaust fans were assumed to generate noise from the same point, when in reality the fans may be located at different areas of the HVAC unit and one or both of the fans may be attenuated by orientation and structures to nearby noise-sensitive receivers.

*Traffic Noise*

Campus Master Plan-generated traffic would increase noise levels on surrounding roadways, including on North State College Boulevard, Nutwood Avenue, Yorba Linda Boulevard, East Chapman Avenue, Associated Road, and Commonwealth Avenue. To determine the noise level increase from Campus Master Plan traffic, traffic noise was modeled with the FHWA RD-77-108 Traffic Noise Prediction Model. The model is a conservative, straight line model that does not consider attenuation from topography or buildings. Traffic noise was modeled for the following scenarios provided in the Campus Master Plan traffic analysis (Fehr & Peers 2019): Existing, Existing Plus Project, Cumulative, and Cumulative Plus Project. Traffic volumes for these scenarios are shown in Table 4.7-10.

**Table 4.7-10 Existing and Future Traffic Volumes**

Roadway	Segment	Speed Limit	Traffic Counts (Average Daily Trips)			
			Existing	Existing Plus Project	Cumulative	Cumulative Plus Project
North State College Boulevard	From SR 91 to Fender Avenue	40	22,952	25,030	24,830	25,850
	From Fender Avenue to Nutwood Avenue	40	24,321	26,640	25,470	26,650
	From Nutwood Avenue to Yorba Linda Boulevard	40	30,625	30,870	34,960	34,970
	From Yorba Linda Boulevard to SR 90	40	25,097	25,220	27,730	28,100

Roadway	Segment	Speed Limit	Traffic Counts (Average Daily Trips)			
			Existing	Existing Plus Project	Cumulative	Cumulative Plus Project
Nutwood Avenue	From North State College Boulevard to N Placentia Avenue	35	21,796	25,540	22,130	24,770
Nutwood Avenue/Primrose Avenue	From Placentia Avenue to Bradford Avenue	35	1,494	1,630	3,390	3,400
Yorba Linda Boulevard	From North State College Boulevard to Placentia Avenue	40	38,598	41,890	40,050	41,730
East Chapman Avenue	From North State College Boulevard to SR 57	40	34,801	34,810	36,850	36,860
	From SR 57 to Bradford Avenue	40	24,067	24,640	28,030	28,210
Associated Road	From SR 90 to Bastanchury Road	40	11,929	12,370	13,270	13,430
	From Bastanchury Road to Yorba Linda Boulevard	40	23,795	26,120	24,870	25,650
Commonwealth Avenue	From Nutwood Avenue to Chapman Avenue	30	10,190	11,280	11,980	13,310
	From E. Chapman Avenue to North State College Boulevard	30	9,287	9,430	12,400	12,410

Source: Fehr & Peers 2019

The traffic speeds utilized in the model, determined by the most applicable speed limit signs on or near each segment, are also shown in Table 4.7-10. To determine the vehicle classification mix for modeling, the traffic mixes observed for the site measurements were used, as shown in Table 4.7-3. For the purposes of modeling, the peak hour traffic volume was utilized in the model to determine the peak hour  $L_{eq}$ . The CNEL is estimated to be equivalent to the peak hour  $L_{eq}$ . Peak hour traffic was assumed to be 10 percent of the ADT.

### c. Impact Analysis

**Threshold 1:** Would the project result in generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

**Impact N-1**      **IMPACT-RELATED AND MECHANICAL EQUIPMENT USED DURING CONSTRUCTION AND OPERATION OF THE CAMPUS MASTER PLAN WOULD RESULT IN NOISE LEVEL INCREASES THAT WOULD EXCEED APPLICABLE CONSTRUCTION AND OPERATIONAL NOISE STANDARDS AT NEARBY NOISE SENSITIVE RECEIVERS. THIS IS A POTENTIALLY SIGNIFICANT IMPACT THAT CAN BE REDUCED TO LESS THAN SIGNIFICANT WITH MITIGATION.**

---

#### *Construction*

##### **GENERAL CONSTRUCTION ACTIVITIES**

The nearest noise-sensitive receptors Campus Master Plan construction activities would be on campus buildings such as residential and academic buildings, and off-site multi-family residential buildings. Over the course of a typical construction day, construction equipment would be located as close as 25 feet to the nearest noise-sensitive campus buildings and 50 feet to the nearest off-site multi-family residential buildings (the multi-family complexes to the south of College Place and east of Langsdorf Drive near the southern extent of the campus), but would typically be located at an average distance further away due to the nature of construction (i.e., each piece of construction equipment would work in different locations throughout the day and average a further distance). Therefore, it is conservatively assumed that over the course of a typical construction day the construction equipment would operate, on average, 75 feet from the nearest noise-sensitive campus buildings and 100 feet from the nearest off-site multi-family residential buildings. At a distance of 75 feet and 100 feet, an excavator, loader, and a dump truck would generate a noise level of 76.4 dBA  $L_{eq}$  and 73.9 dBA  $L_{eq}$ , respectively (RCNM calculations are included in Appendix L). Therefore, Campus Master Plan construction activities would not exceed FTA's criteria for construction noise impacts at residential land uses of 80 dBA  $L_{eq}$  for an 8-hour period. Noise from general on campus construction activities from the Campus Master Plan would be less than significant.

##### **IMPACT-RELATED CONSTRUCTION ACTIVITIES**

Use of impact devices, such as an impact pile driver and a breaker, would potentially occur within the same distances to noise-sensitive land uses as general construction activities described above. At a distance of 75 feet and 100 feet, a pile driver would generate a noise level of 90.8 dBA  $L_{eq}$  and 88.3 dBA  $L_{eq}$ , respectively (RCNM calculations are included in Appendix L). The distance at which a pile driver would generate 80 dBA  $L_{eq}$  would be 260 feet. Therefore, if pile driving occurs within 260 feet of noise-sensitive campus buildings or off-site residences, impacts would be potentially significant.

At a distance of 75 feet and 100 feet, a breaker would generate a noise level of 76.5 dBA  $L_{eq}$  and 74.0 dBA  $L_{eq}$ , respectively. Therefore, construction activities involving a breaker would not exceed FTA's criteria for construction noise impacts at residential land uses of 80 dBA  $L_{eq}$  for an 8-hour period, and impacts would be less than significant.

## *Operation*

Campus Master Plan facilities would intensify noise sources compared to existing conditions. Existing campus and off-site noise-sensitive receivers near the Campus Master Plan site may periodically be subject to noise associated with operation of the Campus Master Plan, which includes stationary noise from mechanical equipment and Campus Master Plan-generated traffic.

### **MECHANICAL EQUIPMENT**

For interior noise levels, this analysis conservatively assumes no vertical distance from the HVAC units to the nearest noise-sensitive receivers, as the HVAC units may be at a similar height to the building facades of nearby buildings. For exterior noise levels, which are typically located on the ground level, and given that the majority of Campus Master Plan buildings are six stories in height (approximately 90 feet from the rooftop to ground level), an extra 90 feet was added to the horizontal distance to the nearest noise-sensitive receivers to account for the vertical distance. Given these assumptions for exterior noise, HVAC unit clusters may be located approximately 140 feet from on-campus noise-sensitive land uses (apartments and academic buildings) and 170 feet from off-campus noise-sensitive land uses (the apartment complexes to the south of College Place and east of Langsdorf Drive near the southern extent of the campus). For interior noise, HVAC unit clusters may be located approximately 50 feet from on-campus noise-sensitive land uses (apartments and academic buildings) and 80 feet from off-campus noise-sensitive land uses (the apartment complexes to the south of College Place and east of Langsdorf Drive near the southern extent of the campus).

A cluster of 4 HVAC units operating at a distance of 140 feet and 170 feet would generate a noise level of 64.9 dBA and 63.2 dBA, respectively. Therefore, HVAC units at the closest Campus Master Plan buildings to noise-sensitive uses would exceed the City of Fullerton's exterior noise standards for noise-sensitive uses of 55 dBA from 7:00 a.m. to 10:00 p.m. and 50 dBA from 10:00 p.m. to 7:00 a.m. An HVAC cluster would have the potential to exceed 50 dBA when within 780 feet of the nearest noise-sensitive use. Therefore, operational noise impacts from HVAC units to exterior areas would be potentially significant.

A cluster of four HVAC units operating at a distance of 50 feet and 75 feet would generate a noise level of 73.9 dBA and 69.8 dBA, respectively. Standard construction techniques for wood-frame construction buildings required under the CBC typically achieve a minimum 25-dBA reduction from exterior sources at interior locations when the windows are in a closed position. Therefore, a 25-dBA reduction is assumed for the exterior noise levels at the building facades. This would result in the HVAC units operating at a distance of 50 feet and 75 feet generating an interior noise level at nearby noise-sensitive receivers of 48.9 dBA and 44.8 dBA, respectively. Therefore, HVAC units at the closest Campus Master Plan buildings to noise-sensitive uses would exceed the City of Fullerton's interior noise standards for noise-sensitive uses of 45 dBA from 10:00 p.m. to 7:00 a.m., but would not exceed the standard of 55 dBA from 7:00 a.m. to 10:00 p.m. An HVAC cluster would have the potential to exceed 45 dBA at an interior location when within 78 feet of the nearest noise-sensitive use. Therefore, operational noise impacts from HVAC units to interior areas would be potentially significant.

### **OFF-SITE TRAFFIC NOISE**

Table 4.7-11 summarizes the traffic noise modeling results. As shown in the table, existing noise levels would increase by up to 0.7 dBA under the Existing Plus Project scenario and 0.5 dBA under the Cumulative Plus Project scenario, which would not exceed the 3 dBA criteria for off-site traffic

noise impacts. Therefore, the Campus Master Plan would not result in a substantial permanent increase in ambient noise levels above levels existing without the Campus Master Plan from Campus Master Plan-generated traffic. Impacts would be less than significant. Impacts would be reduced to less than significant.

Table 4.7-11 Off-site Traffic Noise Levels

Roadway/Segment	Roadway Noise (dBA CNEL) <sup>1</sup>							
	Existing	Existing + Project	Noise Level Increase	Exceed Criteria? <sup>2</sup>	Cumulative	Cumulative + Project	Noise Level Increase	Exceed Criteria? <sup>2</sup>
<b>State College Boulevard</b>								
From SR 91 to Fender Avenue	71.5	71.9	0.4	No	71.9	72.0	0.1	No
From Fender Avenue to Nutwood Avenue	71.8	72.2	0.4	No	72.0	72.2	0.2	No
From Nutwood Avenue to Yorba Linda Boulevard	72.8	72.8	0	No	73.3	73.3	0	No
From Yorba Linda Boulevard to SR 90	71.9	71.9	0	No	72.3	72.4	0.1	No
<b>Nutwood Avenue</b>								
From North State College Boulevard to N. Placentia Avenue	69.3	70.0	0.7	No	69.4	69.9	0.5	No

From SR 57 to Bradford Avenue	71.7	71.8	0.1	No	72.4	72.4	0	No
<b>Associated Road</b>								
From SR 90 to Bastanchury Road	67.3	67.4	0.1	No	67.7	67.8	0.1	No

Roadway/Segment	Roadway Noise (dBA CNEL) <sup>1</sup>							
	Existing	Existing + Project	Noise Level Increase	Exceed Criteria? <sup>2</sup>	Cumulative	Cumulative + Project	Noise Level Increase	Exceed Criteria? <sup>2</sup>
From Bastanchury Road to Yorba Linda Boulevard	70.3	70.7	0.4	No	70.5	70.6	0.1	No
<b>Commonwealth Avenue</b>								
From Nutwood Avenue to E. Chapman Avenue	68.4	68.9	0.5	No	69.1	69.6	0.5	No
From Chapman Avenue to North State College Boulevard	68.0	68.1	0.1	No	69.3	69.3	0	No

<sup>1</sup> The modeled locations were at 50 feet from the roadway centerline.

<sup>2</sup> For purposes of this analysis, a significant impact would occur if Campus Master Plan-related traffic increases the ambient noise environment of noise-sensitive locations by 3 dBA or more if the locations are subject to noise levels in excess of 70 CNEL for exterior areas or 45 CNEL for interior noise levels, or by 5 dBA or more if the locations are not subject to noise levels in excess of the aforementioned standards.

## Mitigation Measures

### *N-1 Pile Driver Noise and Vibration Reduction Measures*

If pile driving is to be used within 260 feet of any occupiable structure on- or off- campus during Campus Master Plan project construction, one of the following measures shall be implemented:

- Use of a pile driver shall not occur within 260 feet of a structure; or
- A Campus Master Plan-specific noise and vibration impact analysis shall be conducted that shall consider the type of pile driver used and potential noise and vibration levels at structures within 260 feet. If, after consideration of the type of pile driver used and other factors of the environment, noise levels do not exceed 80 dBA (8-hour) and vibration levels do not exceed the distinctly perceptible impact for humans of 0.24 in/sec PPV and the structural damage impact to residential structures of 0.2 in/sec PPV, construction may proceed without additional measures. If, after consideration of the type of pile driver used and other factors of the environment, noise levels exceed 80 dBA (8-hour) or vibration levels exceed the distinctly perceptible impact for humans of 0.24 in/sec PPV or the structural damage impact to residential structures of 0.2 in/sec PPV, additional measures shall be implemented to reduce noise and vibration levels below threshold. These measures may include, but not be limited too, use of temporary noise barriers or performing pile driving at a further distance from the noise-sensitive land use.

### *N-2 HVAC Noise Reduction Measures*

Concurrent with design review and prior to the approval of building permits, CSUF shall require a Campus Master Plan-specific design plan for projects demonstrating that the noise level from operation of HVAC units shall not cumulatively exceed the following noise level limits at receiving noise-sensitive land uses as specified in Fullerton Municipal Code Chapter 15.9045:

- For exterior locations, 55 dBA from 7:00 a.m. to 10:00 p.m. and 50 dBA from 10:00 p.m. to 7:00 a.m.
- For interior locations, 55 dBA from 7:00 a.m. to 10:00 p.m. and 45 dBA from 10:00 p.m. to 7:00 a.m.

Noise control measures shall include, but are not limited to, the selection of quiet equipment, equipment setbacks, silencers, and/or acoustical louvers.

## Significance After Mitigation

Impacts from construction using a pile driver would be less than significant with implementation of Mitigation Measure N-1.

Impacts from operational noise from HVAC units would be less than significant with implementation of Mitigation Measure N-2.

**Threshold 2:** Would the project result in generation of excessive groundborne vibration or groundborne noise levels?

**Impact N-2**      **VIBRATION FROM PILE DRIVING DURING CAMPUS MASTER PLAN PROJECT CONSTRUCTION MAY EXCEED APPLICABLE STANDARDS. THIS IS A POTENTIALLY SIGNIFICANT IMPACT THAT CAN BE REDUCED TO LESS THAN SIGNIFICANT WITH MITIGATION.**

---

Construction activities known to generate excessive ground-borne vibration include pile driving. It is unknown at this stage of planning if pile driving would be required to drive foundation piles into the ground. This analysis conservatively assumes the use of an impact pile driver; the upper range for an impact pile driver would create approximately 1.518 in/sec PPV at a distance of 25 feet (FTA 2018). Per estimated distances from Campus Master Plan project construction to existing buildings, a pile driver may be used within 50 feet of the existing buildings. This would equal a vibration level of 0.7086 in/sec PPV at the nearest buildings, which would exceed the distinctly perceptible impact for humans of 0.24 in/sec PPV, and the structural damage impact to residential structures of 0.2 in/sec PPV. The distance to which an impact pile driver would exceed 0.2 in/sec PPV would be approximately 160 feet. Therefore, if an impact pile driver is used within 160 feet of the nearest building, impacts from vibration would be potentially significant.

The greatest anticipated source of vibration during general Campus Master Plan project construction activities would be from a vibratory roller, which would be used during paving activities and may be used within 50 feet of the nearest buildings. A vibratory roller would create approximately 0.210 in/sec PPV at a distance of 25 feet (FTA 2018). This would equal a vibration level of 0.098 in/sec PPV at a distance of 50 feet. This would be lower than what is considered a distinctly perceptible impact for humans of 0.24 in/sec PPV, and the structural damage impact to residential structures of 0.2 in/sec PPV. Therefore, impacts associated with vibration from the roller (and other potential general construction equipment) would be less than significant.

Implementation of the Campus Master Plan would not involve substantial vibration sources associated with operation. Operational vibration impacts would be less than significant.

### **Mitigation Measures**

See Mitigation Measure N-1, above.

### **Significance After Mitigation**

Impacts associated with vibration from construction activities would be less than significant with implementation of Mitigation Measure N-1.

## 4.8 Population and Housing

---

This section describes the existing and projected population and housing conditions at CSUF and describes the growth in population (students, faculty, staff, and their families) directly related to the Campus Master Plan.

It should be noted that changes in population, employment, and housing supply dynamics are social and economic effects, rather than environmental effects. Section 15382 of the CEQA Guidelines states: “An economic or social change by itself shall not be considered a significant effect on the environment.” According to CEQA, these effects should be considered in an EIR only to the extent that they create adverse impacts on the physical environment. This section of the EIR examines the potential for the Campus Master Plan to result in a substantial increase in employment and population, and the resultant demand for housing.

### 4.8.1 Environmental Setting

#### a. Setting

SCAG develops and maintains regional and small area socio-economic forecasting and allocation models for Imperial, Los Angeles, Orange, Riverside, San Bernardino and Ventura counties (SCAG 2020). These estimates and projections are used for both federal and state long-range planning efforts. Additionally, these forecasts are used to help develop and analyze potential impacts stemming from both public and private sector projects.

SCAG projects three major growth indicators: population, households, and employment, for the region. SCAG’s regional forecast maintains the balance between employment, population, and households due to their interrelationship, assuming that employment growth is a driving force of regional population and household growth. Population, household and employment estimates, and forecasts are maintained at the jurisdictional and county unincorporated level. The employment-population-household (EPH) forecast framework has been the basis for developing the regional growth forecast for the SCAG region (SCAG 2020).

#### Regional Forecast

Table 4.8-1 through Table 4.8-3 provide population, household, and employment forecasts through 2040 for the City of Fullerton and surrounding cities.

**Table 4.8-1 SCAG Populations for the City of Fullerton and Surrounding Cities**

City Name	2020 Population	2035 Population	2040 Population
Fullerton	145,700	158,300	160,500
Brea	48,700	50,600	50,600
Anaheim	358,600	382,000	403,400
La Habra	64,800	68,300	68,500
Placentia	53,100	58,500	58,400
Yorba Linda	69,300	70,400	70,500
Buena Park	84,100	90,800	92,500
<b>Total</b>	<b>824,300</b>	<b>878,900</b>	<b>904,400</b>

<b>Total</b>	<b>432,000</b>	<b>481,000</b>	<b>494,300</b>

Source: SCAG Draft 2016 Growth Forecast (2014)

*Translating Population into Housing and Employment*

Based on SCAG’s population forecast provided in Table 4.8-1, the City of Fullerton has the second highest population of all the cities in this area of northeastern Orange County. The populations of these cities are projected to increase by 2040, with the population of Fullerton expected to increase by approximately 14,800. By 2040, SCAG projects the total population to be approximately 904,400, of which Fullerton and Anaheim will account for approximately 18 percent.

Additionally, the SCAG estimates provided in Table 4.8-2 indicate that the City of Fullerton has the second highest number of households in this area. The number of households is projected to increase for all of these cities by 2040. The number of households within the City of Fullerton is projected to grow by approximately 6,400 households. By 2040, SCAG projects the total number of households for all surrounding cities to be approximately 287,800. The number of households for Fullerton will account for approximately 19 percent of SCAG’s projected 2040 total for this area.

Based on SCAG’s 2020 employment (jobs) and household estimates, there are 1.60 jobs per household in Fullerton. The estimated jobs-to-household ratio for Orange County by 2020 is 1.61. Consequently, Fullerton is neither job-rich nor job-poor in comparison to Orange County as a whole. By 2040, 1.7 jobs per household is predicted for the City of Fullerton and 1.6 jobs per household for all of Orange County. Based on these projections, the City of Fullerton is expected to be slightly more job-rich compared to Orange County as a whole.

**City of Fullerton**

The CSUF campus is located within the City of Fullerton. The City of Fullerton’s estimated 2019 population is 142,824 (DOF 2019). Table 4.8-4 provides the state’s 2019 estimates of population and housing for the City of Fullerton and Orange County as a whole.

**Table 4.8-4 Current Housing and Population**

	<b>City of Fullerton</b>	<b>Orange County</b>
Housing Units <sup>1</sup>	49,541	1,104,164
Population <sup>1</sup>	142,824	3,222,498
Employment <sup>2</sup>	65,071	1,726,003
Persons per Household	2.95	3.03

<sup>1</sup>DOF 2019  
<sup>2</sup>DOF E-5, May 2018

As shown in Table 4.8-4, the City of Fullerton’s population of 142,824 comprises about 4.4 percent of the countywide population of 3,222,498. The City’s 49,541 housing units comprise about 4.5 percent of the County’s 1,104,164 total housing units. The average number of persons per household in the City of Fullerton is 2.95, which is 17.5 percent lower than the countywide average of 3.03 persons per household.

**CSU Fullerton Campus Population**

In an effort to keep with its state charter as well as responding to projections of increased enrollment, the CSU Board of Trustees has directed each campus of the CSU system to take the

necessary steps to accommodate additional systemwide enrollment increases. Each year, the CSU negotiates with the State of California for funding to support planned enrollment growth as part of the annual budgeting process. The annual state budget identifies anticipated enrollment growth systemwide for the CSU system each year. According to the 2019-2020 California State Budget, the state expects the CSU system to accommodate growth in enrollment of 10,000 FTES during that period (DOF 2019). Following negotiation, the CSU system allocates enrollment growth funding for California residents according to an enrollment target for each of the 23 CSU campuses. It is expected that each campus manages their enrollments within a small margin of error around the target because they receive state and CSU funding only for the targeted number.

Since the founding of CSUF in 1957, the campus has greatly expanded due to increases in both City and student populations. Historically, there have been three principal master planning efforts, also referred to as Phases; Phase 1: 1960 Master Plan (1960-1969), Phase 2: 1969 Master Plan (1969-1974), Phase 3: 1974 Master Plan (1974-1975). Phase 1 covered a 20-year period from 1960 to 1980 and planned for 35 baccalaureate and 24 postgraduate degrees were planned for a student body of 20,000 and a faculty of 1,000 full-time instructors. By 1968, the start of Phase 2, CSUF had reached over half of their expected enrollment, with a total of 10,750 students enrolled for the Fall semester. A year later, that number increased to 12,793 students. At this point, CSUF started implementing additional components of Phase 2. By the mid 1970's, Phase 3 was a high necessity due to Fullerton's growth as a college city, partially because of CSUF. In the last ten years, campus enrollment has grown an average of 1.2 percent per year, with the last five years growing by approximately 2 percent per year. Additionally, there has been an increase of faculty/staff of approximately 704 between 2010 and 2019 to help support the growing student population.

CSUF has met maximum enrollment capacity, becoming the most populous campus in the CSU system (CSUF 2019b). The number of FTES<sup>1</sup> at CSUF is anticipated to reach 32,000 by 2039, an increase of 5,000 students over the course of the Campus Master Plan. Projected growth rate assumes a one percent annual growth rate, or approximately 350 FTES per year. To accommodate projected FTES enrollment growth, approximately 1,000 faculty/staff will be hired to help service the student population. Campus population relevant to the analysis in this section consists of students, faculty, and staff. Table 4.8-5 shows the projected growth rate of FTES over the life of the master plan.

**Table 4.8-5 CSUF FTES Enrollment Growth Projections**

2018	2022	2026	2030	2034	2038	2039
25,911	26,963	28,057	29,197	30,382	31,616	31,932

Notes: FTES calculated estimating a 1.0 percent growth rate

### CSU Fullerton Campus Housing

Up until the 1990's, CSUF was fully a commuter campus. However, CSUF's enrollment rate quickly initiated the need for campus housing. Through the 1990's, campus housing was built along the eastern border of the campus to create a separation between housing and the campus core.

<sup>1</sup> The FTES calculation is based on the assumptions that a full-time undergraduate student is expected to enroll in 15 units each term (i.e., quarter) and a full-time graduate student is expected to enroll in 12 units each term (i.e., quarter). FTES balances out the amount of instruction involved and level of academic instruction required since not all students take these loads each term. As average unit load changes, the ratio between student headcount and FTES also changes,

Today, the CSUF campus includes a varied mix of on-campus housing types, including residence halls and student apartments. All on-campus housing units are located on the northeast corner of campus. Figure 4.8-1 shows the location of the on-campus residence halls.

There are currently 13 different residence halls on campus, each housing a mix of double and triple occupancy rooms. Additionally, double and single occupancy bedrooms are available in select apartment buildings. Apartment buildings are larger shared living spaces equipped with a shared living room, dining room, and kitchen. Double occupancy accommodations are in three-bedroom apartments housing six students. Single occupancy accommodations are in four-bedroom apartments housing four residents (CSUF 2019a).

Though a large percentage of the freshman student body live in on-campus dorms, there is a portion of both students and faculty/staff that live off campus and commute. In 2011, the Daily Titan, the university's newspaper, surveyed 100 students on their commute to and from campus.

Approximately 82 percent of students commute to campus by car, five percent of students by bus, six percent of students walk, five percent of students bike, one percent of students motorcycle, and one percent of students take the train (Daily Titan 2011). It is reasonable to assume that the off-campus student body live in the City of Fullerton or surrounding cities in either off-campus apartment housing or single-family homes. Likewise, it is reasonable to assume that faculty/staff that commute to campus live in the surrounding region, if not the immediate vicinity to CSUF in either single-family homes or multi-family housing. The Campus Master Plan aims to reduce the amount of commuting to campus to make a more campus-centered environment and reduce overall VMT and GHG emissions.

Fig. 4.8-1 Location of Campus Residence Halls

## 4.8.2 Regulatory Setting

The discussion contained in this section focuses on the regulatory setting relating to the CSUF campus and CSU system-wide planning. No federal laws or regulations relating to population or housing apply to the Campus Master Plan.

### State

#### *California Education Code*

The California Education Code contains several provisions mandating CSU enrollment access levels, to ensure the CSU system accommodates all eligible California resident students. Section 66202.5 of the Education Code states the following:

The State of California reaffirms its historic commitment to ensure adequate resources to support enrollment growth, within the systemwide academic and individual campus plans to accommodate eligible California freshmen applicants and eligible California Community College transfer students, as specified in Sections 66202 and 66730.

The University of California and the California State University are expected to plan that adequate spaces are available to accommodate all California resident students who are eligible and likely to apply to attend an appropriate place within the system. The State of California likewise reaffirms its historic commitment to ensure that resources are provided to make this expansion possible and shall commit resources to ensure that students from enrollment categories designated in subdivision (a) of Section 66202 are accommodated in a place within the system.

Similarly, Section 66011(a) of the California Education Code provides that all resident applicants to California institutions of public higher education who are determined to be qualified by law or by admission standards established by the respective governing boards should be admitted to either a district of the California Community Colleges, in accordance with Section 76000, the CSU, or the University of California. Section 66741 of the California Education Code requires acceptance of qualified transfer students at the advanced standing level.

#### *CSU Five-Year Plan and Operating Budget*

In keeping with its state charter and in response to projections of continued increases in demand for higher education enrollment and to meet California's future workforce needs, the CSU Board of Trustees has directed each campus of the CSU to take the necessary steps to accommodate additional systemwide enrollment increases. The CSU Five-Year Plan allows the Chancellor's Office to examine development and updates of on-campus facilities within the CSU system over a five-year period. The primary objective of the Five-Year Plan for the CSU is to provide facilities appropriate to the CSU's approved educational programs to create environments conducive to learning, and to ensure that the quality and quantity of facilities at the 23 campuses serve the students equally well.

The Board of Trustees requires that every campus have a campus physical master plan for existing and anticipated facilities to accommodate a specified academic year FTES enrollment at an estimated target date, in accordance with approved educational policies and objectives (CSU 2012). Updated annually, the Five-Year Plan for CSUF identifies priority projects, funding sources, systemwide needs, and self-support reserves for student housing in the 2020-21 academic year. It

also notes a five percent projected 2021-22 bed space capacity per estimated student headcount at CSUF; the lowest of all CSU campuses, based on multi-year projections (CSU 2019b).

Each year, the CSU negotiates with the State of California for funding to support planned enrollment growth as part of the annual budget process. The annual state budget identifies anticipated enrollment growth systemwide for the CSU each year; according to the 2019-2020 California State Budget, the state expects the CSU to accommodate growth in enrollment of 10,000 FTES during that period (CSU 2019c). Following negotiation, the CSU allocates enrollment growth funding for California residents according to an enrollment target for each of the 23 CSU campuses. Campuses are expected to manage their enrollments within a small margin of error around the target because they receive state/CSU funding only for the targeted number.

### *California State University Graduation Initiative 2025*

Graduation Initiative 2025 is the CSU's initiative to increase graduation rates for all CSU students while eliminating opportunity and achievement gaps. Through this initiative the CSU strives to ensure that all students have the opportunity to graduate in a timely manner according to their personal goals, positively impacting their future and producing the graduates needed for the California and national workforce. The Graduation Initiative 2025 establishes the following goals for 2025: 40 percent freshman four-year graduation rate, 70 percent freshman six-year graduation rate, 45 percent transfer two-year graduation rate, 85 percent transfer four-year graduation rate, and eliminate all equity gaps for underrepresented minorities and Pell Grant-eligible students to achieve equity. To achieve this goal, CSUF needs to increase its capacity to support students both academically, in the form of additional programs and physical academic space, and with sufficient housing and services that ultimately support students and the academic mission of university.

### *CSU Basic Needs Initiative*

The CSU Basic Needs Initiative was based on the results of the 2018 Study of Student Basic Needs and establishes support programs at CSU campus. One of the goals of the initiative is to provide students with on-campus emergency housing or vouchers for off-campus housing. Four campuses provide assistance with long-term housing arrangements (CSU 2019d).

### *The State Dormitory Construction Fund*

The State Dormitory Construction Fund was established under the State Revenue Bond Act of 1947 and bonds were initially sold to support the construction of campus housing facilities. In 1957, the legislature approved a residence hall program, which was financed by both state and federal funds. Today, the CSU Housing Program is a self-supporting program deriving its revenues primarily from fees collected for the use of the residence facilities. Funds are used for current operating expenses, maintenance and repair, improvements to facilities, and interest and principal payments on outstanding bonds. After payment of all authorized charges, the balances in any of these funds remain available for future program expenses (CSU 2019a).

## **Local**

CSUF is an entity of the CSU, which is a constitutionally created state agency, and is therefore not subject to local government planning and land use plans, policies, or regulations. CSUF may consider, for informational purposes, aspects of local plans and policies for the communities surrounding the campus when it is appropriate. The Campus Master Plan would be subject to State

and federal agency planning documents described herein but would not be bound by local or regional planning regulations or documents such as The Fullerton Plan or the City's Municipal Code.

*Southern California Association of Governments (SCAG) Regional Housing Needs Assessment (RHNA)*

The RHNA is mandated by State Housing Law as part of the periodic process of updating local housing elements. The RHNA quantifies the need for housing within each jurisdiction during specified planning periods. SCAG is in the process of developing the 6th cycle RHNA allocation plan which will cover the planning period October 2021 through October 2029. Communities use the RHNA in land use planning, prioritizing local resource allocation, and in deciding how to address identified existing and future housing needs resulting from population, employment and household growth. The RHNA does not necessarily encourage or promote growth, but rather allows communities to anticipate growth, so that collectively the region and subregion can grow in ways that enhance quality of life, improve access to jobs, promotes transportation mobility, and addresses social equity, fair share housing needs. The City of Fullerton, and neighboring cities are located in SCAG's jurisdiction and are subject to RHNA requirements.

*The Fullerton Plan*

It is assumed that the majority of population increase associated with the Campus Master Plan would reside in the City of Fullerton and to a lesser extent, in neighboring cities.

The Fullerton Plan aims to achieve the City's vision by aligning city efforts, connecting with local and regional partners and advocating for community engagement. The plan provides a framework for the community and covers different sectors such as economics, demographics, and physical characteristics. Specific policies in the Fullerton Plan that relate to population and housing and relevant to the Campus Master Plan include the following:

**Housing**

The Housing Element (2015) was developed to identify and analyze existing and projected housing needs and to illustrate official policies for the preservation, conservation, rehabilitation, and production of housing in the City of Fullerton. The Housing Element addresses opportunities for current and future Fullerton residents and provides the primary policy guidance for local decision making related to housing. As required by State law, the Housing Element identifies strategies and programs that focus on: (1) housing and neighborhood conservation; (2) providing adequate sites to achieve diversity of housing; (3) opportunities for affordable housing; (4) removing governmental constraints as necessary; and (5) promoting equal housing opportunities. Specific policies include the following:

- **P3.1 Provision of Adequate Sites for Housing Development**
- **P3.2 Affordability Monitoring**
- **P3.3 Expedited Processing for Extremely-Low, Very-Low, Low, and Moderate-Income Housing Developments**
- **P3.4 Facilitate Infill Development**
- **P3.5 Encourage Mixed-Use Development**
- **P3.6 Development of Housing for Large Families**
- **P3.7 Encourage Senior Housing**

- **P3.8 Use of Surplus City-Owned Land for Affordable Housing**
- **P 3.9 Support Community Housing Development Organization Projects**
- **P3.10 Establish Comprehensive Community Outreach Strategy for Housing**
- **P3.13 Affordable Housing Acquisition and Rehabilitation**
- **P3.15 Code Enforcement**
- **P3.19 Relocation Assistance**
- **P3.21 Continued Monitoring and Preservation of Housing Units At-Risk of Converting to Market Rate**
- **P3.22 Continue Support of Regional Fair Housing Efforts**

#### **Growth Management**

- **P7.1 Balanced Decision-making.** Support regional and sub-regional efforts to focus growth and development within areas that can be adequately served by existing and planned infrastructure systems.
- **P7.2 Housing Growth.** Support projects, programs, policies and regulations to accommodate housing growth consistent with the Regional Housing Needs Assessment in areas of the City with existing and planned infrastructure capabilities.

#### **Community Development and Design**

- **P1.9 Housing Choice.** Support projects, programs, policies and regulations to create housing types consistent with market demand for housing choice.

#### **Education**

- **P17.10 Housing to Support Educational Facilities.** Support policies, projects and programs that facilitate efforts by educational institutions and the private sector to develop an adequate supply of housing for faculty and staff of all schools, as well as adequate housing for college and university students.

### 4.8.3 Impact Analysis

#### **a. Thresholds of Significance**

Impacts related to population are generally social or economic in nature. Under CEQA, a social or economic change generally is not considered a significant effect on the environment unless the changes can be directly linked to a physical change. Impacts related to population and housing would normally be potentially significant if they exceed the following significance criteria in accordance with Appendix G of the CEQA Guidelines:

- Induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure).
- Displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere.

## b. Methodology

The examination of population, employment, and housing conditions is based in part on data found in the 2003 Master Plan, CSU Five-Year Plan, CSU Housing Program, CSUF enrollment information, and other university resources as cited.

## c. Impact Analysis

**Threshold 1:** Would the project induce substantial unplanned population growth in an area, either directly (for example, by proposing new homes and businesses) or indirectly (for example, through extension of roads or other infrastructure)?

**Impact PH-1** THE CAMPUS MASTER PLAN WOULD GENERATE APPROXIMATELY 7,000 FTES AND 1,000 FACULTY AND STAFF. THIS POPULATION GROWTH IS ACCOMMODATED IN REGIONAL POPULATION FORECASTS. IMPACTS WOULD BE LESS THAN SIGNIFICANT. NO MITIGATION MEASURES ARE REQUIRED.

---

The Campus Master Plan is intended to serve a projected increase of 7,000 FTES, along with sufficient faculty and staff to provide instruction and support services to accommodate the demand of this increased headcount. The current enrollment for CSUF is approximately 25,000 FTES, which is the maximum enrollment capacity under the 2003 Master Plan. The Campus Master Plan anticipates that CSUF would reach 32,000 FTES by 2039, an increase of 7,000 students. An increase of approximately 1,000 faculty and staff would be needed to serve the proposed increase in academic, research, housing, event, and other facility space described in Section 2.0, *Project Description*. This is consistent with DOF enrollment growth projections for the CSU during this period and with recent annual enrollment increases for CSUF as determined during annual consultation with the CSU Office of the Chancellor (DOF 2019).

To accommodate the projected FTES growth rate, the Campus Master Plan proposes 3,000 additional student beds and 350 faculty and staff beds. Approximately 600 of the proposed 3,000 student beds were previously approved and analyzed in the 2003 Master Plan. These 600 beds are included in this discussion as these units have not yet been constructed and would serve future students accommodated under the Campus Master Plan.

Table 4.8-6 shows the approximate number of current and proposed on-campus and off-campus residences. The Campus Master Plan would result in an increase of approximately 3,350 student and faculty residents on-campus and an expected 4,650 students and faculty that would reside off-campus by the Campus Master Plan horizon year.

**Table 4.8-6 CSUF Student and Faculty/Staff Housing**

	Existing (2019)	Approved Student Housing Project	Campus Master Plan Addition (2039)	Total 2039 Population
<b>On-Campus Residents</b>				
Students <sup>1</sup>	2,000	600	2,400	<del>5,600</del> <u>5,000</u>
Faculty/Staff	6	0	350	356
Total On-Campus Residents	2,000	600	2,750	<del>5,956</del> <u>5,356</u>
<b>Off-Campus Residents</b>				
Students	23,000	0	4,000	27,000
Faculty/Staff	4,000 <sup>2</sup>	0	650 <sup>1</sup>	4,650
Total Off-Campus Residents	27,000	0	4,650	31,050
Total Population	29,000	600	7,400	37,000

<sup>1</sup>CSUF 2019c

<sup>2</sup>CSUF 2019d

Note: Numbers are approximate.

The Campus Master Plan would add approximately 7,000 total FTES by 2039: ~~2,400~~3,000 on-campus student residents and ~~4,600~~4,000 off-campus student residents.

Approximately 600 of the proposed 3,000 student housing units/beds have already been approved and impacts were evaluated under the 2003 Master Plan and are the subject of separate environmental review. These units/beds are included in this analysis table as they have not yet been constructed and are a part of the projected 3,000 additional student beds accommodated under the Campus Master Plan.

The Campus Master Plan would add approximately 1,000 faculty/staff by 2039: 350 on-campus faculty/staff residents and 650 off-campus faculty/staff residents.

This analysis conservatively assumes that all new students and faculty/staff would be new residents to the City. In reality, it is reasonable to assume that a percentage of this population would already reside in the Fullerton and neighboring jurisdictions as many students come from feeder high schools located in the cities surrounding the CSUF campus. Freshmen Fall enrollment in 2019 was 5,958 students (CSUF 2019c), with 1,432 of these students coming from feeder high schools in Orange County (CSUF 2019d). Approximately 24 percent of the incoming freshmen student body attended Orange County high schools and are assumed to be existing residents of the City of Fullerton.

The Campus Master Plan would result in a gradual increase of approximately 7,000 students and 1,000 faculty/staff. As shown in Table 4.13-6, the Campus Master Plan would add 3,000 on-campus residential beds and 350 faculty/staff beds, for a total of 3,350 on-campus residential beds. ~~Approximately 600 of the proposed 3,000 student beds have been approved and analyzed under the 2003 Master Plan.~~ Assuming one student or faculty/staff member per bed, housing for 3,350 individuals would be constructed on campus by 2039, therefore 3,350 individuals would be housed on the CSUF campus following buildout of the Campus Master Plan. Given that the Campus Master Plan would result in 8,000 students and faculty added to the campus population (7,000 students and 1,000 faculty/staff), 4,650 students and faculty are expected to reside off-campus.

The projected total population for 2040 for the City of Fullerton and surrounding cities is 904,400 (see Table 4.8-2). SCAG forecasts take into consideration in- and out-migration trends, including fluctuations in university populations; therefore, the population increase associated with the

Campus Master Plan would be part of SCAG's population forecasts. Based on SCAG's projections, the addition of 8,000 residents under the Campus Master Plan would account for less than one percent of the total area population by 2040 and would not represent substantial unplanned growth.

The Campus Master Plan would likely induce some indirect population growth due to regional commercial and business activity spurred by an increase in the student and faculty/staff population. A 2017 study by CSUF found that the university created 15,000 new jobs and generated a total spending impact of nearly \$2.6 billion on the regional economy (CSUF 2019c). This indirect population growth is and would continue to be included in the SCAG population forecast and would not be considered unplanned.

For the reasons stated above, implementation of the Campus Master Plan would not induce substantial unplanned direct and indirect population growth. This impact would be less than significant.

### Mitigation Measures

No mitigation measures are required.

### Significance After Mitigation

Impacts would be less than significant without mitigation.

<b>Threshold 2:</b> Would the project displace substantial numbers of existing people or housing, necessitating the construction of replacement housing elsewhere?
--

**Impact PH-2** THE CAMPUS MASTER PLAN WOULD NOT DISPLACE EXISTING PEOPLE OR HOUSING AND WOULD INCLUDE 3,350 UNITS OF ON-CAMPUS HOUSING FOR STUDENTS AND FACULTY/STAFF. AN ADDITIONAL 4,650 STUDENTS AND FACULTY/STAFF ARE EXPECTED TO RESIDE IN THE CITY OF FULLERTON AND NEIGHBORING JURISDICTIONS. LOCAL PLANS AND POLICIES GOVERNING HOUSING PROVISION WOULD SUPPORT APPROPRIATE HOUSING DEVELOPMENT AND REDUCE THE POTENTIAL FOR DISPLACEMENT. IMPACTS WOULD BE LESS THAN SIGNIFICANT. NO MITIGATION MEASURES ARE REQUIRED.

The Campus Master Plan would include the construction of 2,400 student beds and 350 faculty beds to accommodate projected future growth in student enrollment and employees. An additional 600 student beds have been approved and analyzed under the 2003 Master Plan and are included in this analysis as they will serve future students accommodated under the Campus Master Plan. The Campus Master Plan directs the construction of new and on-campus housing and the renovation of existing on-campus housing. Renovations would not displace existing students. The Campus Master Plan would not require the demolition of housing.

As discussed in Impact PH-1, 4,650 students and faculty would be accommodated by off-campus housing. Based on current trends discussed in Existing Setting, it is likely that most of these students and faculty/staff would reside in the City of Fullerton or neighboring jurisdictions. Using a highly conservative assumption that all new students, staff, and faculty not living on campus would occupy an individual housing unit, there would be a need to accommodate 4,650 households. Using the data provided in Table 4.13-3, this number represents less than one percent of the new households forecasted in the region by 2040.

Under State law, the City of Fullerton and neighboring jurisdictions are required to address planning for housing needs in the Housing Elements of their general plans, in compliance with the SCAG

RHNA. Local policies, including those included in The Fullerton Plan and Municipal Code, would guide housing development to accommodate the needs of future population growth, particularly housing for low-income residents, and decrease potential impacts to existing residents from housing and economic displacement. Policies encouraging infill and mixed-use development would focus growth in existing neighborhoods, decreasing the likelihood of necessitating housing construction in undeveloped areas or outside the City of Fullerton and neighboring jurisdictions. Additionally, policy P17.10 of The Fullerton Plan, *Housing to Support Educational Facilities*, addresses the City's desire and cooperation to accommodate the student and faculty/staff population growth associated with educational institutions. Therefore, the Campus Master Plan would not displace substantial numbers of people or housing, necessitating the construction of replacement housing elsewhere. Impacts would be less than significant.

### **Mitigation Measures**

No mitigation measures are required.

### **Significance After Mitigation**

Impacts would be less than significant without mitigation.

## 4.9 Public Services

---

This section assesses potential impacts of Campus Master Plan implementation on the demand for and provision of public services including fire protection and emergency response services, law enforcement, public schools, libraries, and medical services. Impacts to parks and recreational facilities are discussed in Section 4.10, *Recreation*. Impacts to public utility services are discussed in Section 4.12, *Utilities*.

### 4.9.1 Environmental Setting

#### a. Law Enforcement

##### *University Police Department*

The University Police Department (UPD) provides police protection services on campus, over which it has primary jurisdiction. The UPD station is located at 800 North State College Boulevard, on the west side of campus. As of this writing, the UPD consists of 12 different units staffed by 25 sworn officers and investigators (led by one chief of police and two captains), 10 dispatchers, North County Special Weapons and Tactics (SWAT) officers, 41 student Community Service Officers (CSOs), and several civilian employees and volunteers (UPD 2019). All UPD police officers are sworn peace officers under California Penal Code Section 830.2(c) and possess the same authority of arrest as any other police officer in the state of California under Section 89560 of the California Education Code. UPD Officers patrol adjacent public streets and property within a one-mile radius of the campus. UPD jurisdiction also includes CSUF's Off-Campus Centers in the City of Placentia and the City of Irvine (CSUF 2019a).

The UPD conducts routine patrols on foot, vehicle, motorcycle, and bicycle of campus, central buildings, parking structures, parking lots, residence halls, and overall grounds to monitor security and to address safety concerns 24 hours a day. In addition to routine patrols, the UPD provides the following services:

- Campus maintenance and lighting surveys and reporting to Facility Operations for repair
- Blue emergency telephones
- Safety escort services
- Crime prevention units located within Housing Community Resources Center to connect with on-campus housing
- 9-1-1 communications

UPD maintains operational Memoranda of Understanding (MOUs) with the Fullerton Police Department (FPD) regarding interagency responses (Willey 2019).

The current staffing goal of the UPD is one officer per 1,000 students. Response times average 1.5 minutes per call for service. The UPD currently employs 25 sworn officers, half of which are on patrol, with the remainder on different administrative/specialty assignments (Willey 2019).

Crime statistics for the years 2016 through 2018 are shown in Table 4.9-1 below.

**Table 4.9-1 Crime Statistics for CSUF (2016-2018)**

<b>Criminal Offense</b>	<b>2016</b>	<b>2017</b>	<b>2018</b>
Murder/Non-negligent manslaughter	0	0	0
Negligent Manslaughter	0	0	0
Rape	5	5	9
Fondling	4	9	9
Incest	0	0	0
Statutory Rape	0	0	0
Robbery	1	3	2
Aggravated Assault	4	1	2
Burglary	31	10	12
Motor Vehicle Theft	10	8	8
Arson	1	1	4
Dating Violence	1	2	18
Domestic Violence	2	0	1
Stalking	13	21	16
Liquor Law Arrests	16	2	1
Liquor Law Referrals	234	148	230
Drug Law Arrests	55	43	25
Drug Law Referrals	196	52	88
Weapon Law Arrests	15	12	4
Weapon Lap Referrals	4	1	0

Notes: Reported criminal offenses from on campus, non-campus, and public property

Source: CSUF 2019a

*City of Fullerton Police Department*

The FPD serves the City of Fullerton and consists of approximately 220 employees, 150 sworn and 70 civilian positions. In 2015, the latest available data, dispatchers for FPD processed a total of 206,968 phone calls consisting of 58,325 incoming 911 calls, 93,387 incoming seven digit calls, and 55,256 outbound calls. A total of 83,571 Mapping Computer Aided Dispatch incidents were recorded and dispatchers managed a total of 1,419,599 radio transmissions.

The FPD is divided into several divisions and units. The Operations Division consists of the Patrol Division, the Traffic Bureau, as well as the Narcotics Unit, the Gang Unit, the Directed Enforcement Team, the Echo Unit, and the Homeless Liaison Team. The Support Services Division consists of primary Investigation units, and Professional Standards Bureau for both Training and Internal Affairs. Support Services also includes Records Bureau, Jail, Communications Bureau, Crime Scene Investigation Unit, as well as the Community Services Bureau. The Investigation Unit consists of the Crimes Property Unit, the Family Crimes Unit and the Property Crimes Unit, Crime Scene Investigation Unit, as well as the Training Bureau and Communications Bureau.

Patrol deployment is divided into three zones which stretch from the southern city limits (SR 91) to the north city limits. Zone I runs from the western city limits to Euclid Ave. Zone II runs from Euclid Ave to Raymond Ave. Zone III runs from Raymond Ave. to the eastern city limits (FPD 2015).

CSUF is located in an urbanized area in the City of Fullerton. According to the Community Crime Map, the area in the city with the highest concentration of crime is in downtown Fullerton, approximately two miles southwest of the campus (LexisNexis 2019). In the area of the City surrounding CSUF, property crimes, specifically auto burglaries and thefts from vehicles, were the most common type of crime in the area (FPD 2015).

### *The Orange County Sheriff-Coroner Department*

The Orange County Sheriff-Coroner Department (OCSCD) is a large, multi-faceted law enforcement agency served by approximately 3,800 sworn and professional staff members and over 800 reserve personnel. The department consists of five organizational Commands comprising 21 separate Divisions. The Executive Command includes Sheriff's Executive Management and Public Affairs; the Administrative Services Command includes Communications and Technology, Financial and Administrative Services, Research and Development and Support Services; the Custody Operations and Court Services Command include the three jail facilities in Orange County and Inmate Services; the Field Operations and Investigative Services Command includes Airport Operations, Homeland Security, North and South Patrol Operations, Investigations, Coroner, Emergency Communications, Crime Lab, and Reserve and Volunteer Bureau; and the Professional Services Command includes Court Operations, Professional Standards, S.A.F.E., Training, and Community Programs.

Collectively, these Commands and Divisions provide services including land and sea-based patrol and investigative services to unincorporated county areas and to contract and task force partners at the city and county levels. Additional services and responsibilities include but are not limited to state and federal task force participation, operation and management of the Orange County jail system including contract services for Immigration and Customs Enforcement (ICE) detainees, emergency communications, forensic and coroner services, human resources, and personnel services, risk management and financial management (OCSCD 2019).

### **b. Fire Protection**

CSUF receives fire protection and emergency services from the City of Fullerton Fire Department (FFD). The FFD is composed of 95.5 trained professional employees at six fire stations strategically located throughout the City (Fullerton 2019a). FFD operates under three divisions: Administration Division, Operations/Training Division, and Fire Prevention Division. The FFD has six fire stations throughout the City.

Fire Station 1 is located at 312 E Commonwealth Avenue and serves as the main headquarters. Fire station 2 is located at 1732 W Valencia Drive; Fire Station 3 is located at 700 S Acacia Avenue; Fire Station 4 is located at 3251 North Harbor Boulevard; Fire Station 5 is located at 2555 Yorba Linda Boulevard; and Fire Station 6 is located at 2691 Rosecrans Avenue. CSUF is primarily served by Fire Station 5, located on the north side of the campus across the Fullerton Arboretum and Yorba Linda Boulevard. In the event of a large-scale emergency, other fire stations assist Station 5.

FFD sponsors several programs under its operation including the Community Emergency Response Team (CERT). CERT members learn basic disaster response skills such as fire safety, light search and rescue, team organization, and disaster medical operations. Additionally, CERT members can help assist others in their neighborhoods and workplace when professional responders are not immediately available. In addition to providing emergency response services and firefighting services, FFD is responsible for enforcing fire codes, providing fire inspections, assisting in planning and development standards for High Fire Hazard Areas (and enforcing such standards), and community education and outreach (Fullerton 2019a).

FFD is a member of the Metro Cities Fire Authority (MCFA), which handles dispatch calls for several cities in Orange County. From January to December of 2018, FFD responded to 27,450 calls, of which 25,693 (93 percent) were in the City of Fullerton (MCFA 2018).

**c. Schools**

*Fullerton School District and Fullerton Joint Union High School District*

CSUF is located within the service area of the Fullerton School District (FSD), which consists of 10 preschools, 15 elementary schools, two K-8 schools, and three junior high schools. Approximately 13,700 students in grades K-8 were enrolled in the FSD for the 2018-19 school year (FSD 2019).

CSUF is also located in the service boundary of Fullerton Joint Union High School District (FJUHSD), which is responsible for all high school education in the City of Fullerton, providing educational services for students in ninth to twelfth grades. The district serves a 50-square-mile area that includes the elementary school districts of Buena Park, Fullerton, La Habra, and Lowell Joint. Six four-year comprehensive high schools are operated by FJUHSD: Buena Park, Fullerton, La Habra, Sonora, Sunny Hills, and Troy High Schools. La Vista High School, a continuation high school, and La Sierra High School, an alternative high school, also serve FJUHSD students.

The nearest schools to the CSUF campus are Acacia Elementary School, Ladera Vista Junior High School of the Arts, and Troy High School, La Vista High School, and La Sierra High School. Acacia Elementary School is located approximately 0.50 mile west of the CSUF campus at 1200 N Acacia Avenue. Ladera Vista Junior High School of The Arts is located approximately one mile southwest of campus at 1700 E. Wilshire Avenue. Troy High School, La Vista High School, and La Sierra High School are each located within 1,000 feet of the CSUF campus, to the west. Table 4.9-2 shows the 2018-19 enrollment and the capacity of elementary and junior high schools in Fullerton. District enrollment has been in a slight downward trend since 2014 (Ed-Data 2020).

**Table 4.9-2 Fullerton School District Enrollment and Capacity**

School	2018-19 Enrollment <sup>1</sup>	School Capacity <sup>2</sup>	Difference
<b>K-6 Schools</b>

<sup>1</sup> Ed-Data 2020, based on Census Day enrollment

<sup>2</sup>FSD maximum capacity is 32 students per class (Greenwood 2020)

Topaz Elementary School, located at 3232 Topaz Lane within the City of Fullerton, is serviced by the Placentia-Yorba Linda Unified School District. During 2018-19, Topaz Elementary School had 511 students enrolled. In addition to collection of statutory required developer fees, growth in student population has been accommodated on a project-by-project basis. This has sometimes involved mitigation agreements as well as establishment of Community Facility Districts (Fullerton 2012).

Table 4.9-3 shows the 2018-19 enrollment and the capacity of high schools in Fullerton. La Sierra High School is not included in the enrollment and capacity analysis for the district.

**Table 4.9-3 Fullerton Joint Union High School District Enrollment and Capacity**

School	2018-19 Enrollment <sup>1</sup>	School Capacity <sup>2</sup>	Available Capacity
Buena Park High School, 8833 Academy Drive	1,937	2,349	412

<b>District Total</b>	<b>13,695</b>		

<sup>1</sup> Ed-data 2020

<sup>2</sup> The Fullerton Plan EIR (Fullerton 2012)

As shown in Table 4.9-2 and Table 4.9-3, the school districts in the City of Fullerton have available capacity for additional students. FJUHS is currently operating at 92 percent capacity. FJUHS offers an open enrollment policy where a Fullerton resident can elect to transfer to any school within the District. Acceptance in the school would depend on the capacity of that particular school, as well as other factors established by State law and District Board Policy (Fullerton 2008).

#### **d. Public Libraries**

##### *CSUF Libraries*

Pollak Library is the main campus library and serves CSUF students, faculty, and staff. Pollak Library consists of a North and South wing, each housing different services and collections. The North Wing consists of archives, study rooms, the Writing Center, the Advanced Technology Lab, the Innovation/Makerspace Center, and the Children's Literature Center. The South Wing consists of, but is not limited to, the College of Communications, the Diversity Initiatives and Resource Center, the LGBTQ Queer Resource Center, University Honors Center, Academic Technology Center, and Special Collections. The Pollak Library on the CSUF campus is currently being remodeled in accordance with the system-wide initiative called Library of the Future (LOFT) and is near completion. It recently completed three major capital improvement projects, including renovations to the fourth, fifth, and sixth floors and fire line safety improvements (CSUF 2019b).

##### *Fullerton Library and Orange County Public Libraries*

Fullerton Public Library is operated by the City of Fullerton and is located at 353 W. Commonwealth Avenue approximately three miles west of CSUF. Fullerton Public Library is approximately 61,000 square feet (sf), having undergone a significant renovation in 2011 (League of California Cities 2012). The population of Fullerton is currently 142,824; therefore, its library service ratio is 2.34 persons per square foot of library space.

Orange County Public Libraries (OCPL) is a network of community libraries, with 33 branches and an outlet in the Orangewood Children's Home. Some of the branches are operated within the jurisdiction of the county's 33 cities and some within the county's unincorporated area (OCPL 2019). Other nearby libraries are located at Fullerton College, Hope International University, and Marshall B. Ketchum University, and in neighboring cities.

#### **e. Medical Services**

##### *CSUF Student Health and Counseling Center*

The Student Health and Counseling Center is the primary care facility for students, located on the CSUF campus. It currently employs two administrative staff members, seven health practitioners, and three sports therapists. The Student Health and Counseling Center receives approximately 40,000 annual visits (CSUF 2014).

##### *St. Jude Medical Center*

St. Jude Medical Center (SJMC) is the closest regional hospital, located at 101 E Valencia Mesa Drive in Fullerton, approximately 2.17 miles from CSUF. SJMC is a faith-based, non-profit, 320-bed, acute care hospital with approximately 700 physicians. In 2014, the hospital added a new four-story, 200,000-square-foot hospital wing connected to an existing tower on the first and fourth floors. The tower features 120 patient beds, 14 operating rooms with "smart" surgical suites, a spacious

cafeteria, materials management, pharmacy and areas for support staff. The project also entailed construction of a 20,000-square-foot central utility plant, a 215-vehicle parking structure expansion and rerouting of major site utilities on an active medical campus (Providence 2019).

## 4.9.2 Regulatory Setting

### State

#### *2018 California Strategic Fire Plan (Fire Plan)*

The 2018 California Strategic Fire Plan (Fire Plan) is a cooperative effort between the State Board of Forestry and Fire Protection and the California Department of Forestry and Fire Protection (CALFIRE 2018). The 2018 Fire Plan reflects a focus on fire prevention, suppression activities, and natural resource management to maintain the State's forests as a resilient carbon sink to meet California's climate change goals and to serve as important habitat for adaptation and mitigation. Major components center on the following goals:

- Improve the availability and use of consistent, shared information on hazard and risk assessment
- Promote the role of local planning processes, including general plans, new development, and existing developments, and recognize individual landowner/homeowner responsibilities
- Foster a shared vision among communities and the multiple fire protection jurisdictions, including county-based plans and community-based plans such as Community Wildfire Protection Plans
- Increase awareness and actions to improve fire resistance of man-made assets at risk and fire resilience of wildland environments through natural resource management
- Integrate implementation of fire and vegetative fuels management practices consistent with the priorities of landowners or managers
- Determine and seek the needed level of resources for fire prevention, natural resource management, fire suppression, and related services
- Implement needed assessments and actions for post-fire protection and recovery

#### *State Multi-Hazard Mitigation Plan*

The State Multi-Hazard Mitigation Plan (SHMP) intends to significantly reduce deaths, injuries, and other losses attributed to natural and human-caused hazards in California. The SHMP provides guidance for hazard mitigation activities emphasizing partnerships among local, state, and federal agencies as well as the private sector. The SHMP is federally required under the Disaster Mitigation Act of 2000 in order for the state to receive federal funding in case of disaster. The California Office of Emergency Services prepares the California SHMP, which identifies hazard risks, and includes a vulnerability analysis and a hazard mitigation strategy.

#### *California Fire Code (Title 24, Part 9, California Code of Regulations)*

The California Fire Code incorporates the Uniform Fire Code (UFC) with necessary California amendments. This Code prescribes regulations consistent with nationally recognized good practices for the safeguarding, to a reasonable degree, of life and property from the hazards of fire explosion. It also addresses dangerous conditions arising from the storage, handling, and use of hazardous

materials and devices; conditions hazardous to life or property in the use or occupancy of buildings or premises; and provisions to assist emergency response personnel.

#### *California Building Code*

The 2016 CBC became effective January 1, 2017, including Part 9 of Title 24, the California Fire Code. Section 701A.3.2 of the CBC requires that new buildings located in any Fire Hazard Severity Zone within State Responsibility Areas, any Local Agency Very-High Fire Hazard Severity Zone (VHFHSZ), or any Wildland-Urban Interface Fire Area designated by the enforcing agency for which an application for a building permit is submitted, comply with all sections of the Chapter.

#### *Senate Bill 50*

The Leroy F. Greene School Facilities Act of 1998, or Senate Bill 50 (SB 50), restricts the ability of a local agency to deny project approvals on the basis that public school facilities (classrooms, auditoriums, etc.) are inadequate. School impact fees are collected at the time building permits are issued. These fees are used by the local schools to accommodate the new students added by the project, thereby reducing potential impacts on schools to a less-than-significant impact. Payment of school fees is required by SB 50 for all new residential development projects and is considered full and complete mitigation of school impacts. The Fullerton School District and the Fullerton Joint Union High School District, and other school districts in Orange County, collect fees from new residential and commercial/industrial development based on square footage.

#### *CSUF Emergency Operations Plan*

The CSUF Emergency Operations Plan (EOP) (last updated September 2018) defines the scope of preparedness and incident management activities and directs the University's response to emergency situations and disasters. The EOP describes organizational structures, roles and responsibilities, policies, and protocols for providing emergency support, including coordination with the UPD and FFD. The Emergency Management Coordinator in the UPD oversees the program and is responsible for keeping the EOP up to date.

#### *CSU Policies on Mutual Aid*

According to CSU Executive Order 1046, effective date January 1, 2010, "the Assistant Vice Chancellor for Risk Management and Public Safety shall ensure that each CSU Police Department has a policy that delineates the specific geographical boundaries of its jurisdiction as required by California Education Code section 89560."

The Assistant Vice Chancellor for Risk Management and Public Safety shall ensure that each CSU Police Department has agreements with neighboring agencies that specify the procedure for requesting mutual aid, and each respective agency's responsibilities where there is concurrent jurisdiction, as required by the Kristin Smart Campus Safety Act of 1998, California Education Code section 67381." Each CSU Police Department must have agreements with neighboring agencies that specify the procedure for requesting mutual aid.

## **Local**

CSUF is an entity of the CSU, which is a constitutionally created state agency, and is therefore not subject to local government planning and land use plans, policies, or regulations. CSUF would be subject to state regulations and planning documents described herein, but would not be bound by

local or regional planning regulations or documents such as The Fullerton Plan or municipal code. CSUF may consider, for informational purposes, aspects of local plans and policies for the communities surrounding the campus when it is appropriate.

#### *The Fullerton Plan (2012)*

The Fullerton Plan, aims to achieve the City's vision by aligning city efforts, connecting with local and regional partners and advocating for community engagement. The plan provides a framework for the community and covers different sectors such as economics, demographics, and physical characteristics. Specific policies in The Fullerton Plan that relate to public services and relevant to the Campus Master Plan include the following:

#### **Public Safety**

- **P12.2 Collaboration with Outside Agencies.** Support regional and subregional efforts to prevent violence, child abuse, sexual assault, domestic violence, illegal use of firearms, violence associated with substance abuse, crimes against property and other similar issues.
- **P12.3 Community Confidence Building.** Support policies and programs that bolster productive communication and problem-solving between public safety personnel and the Fullerton community.
- **P12.4 Balance Safety Needs.** Support policies, projects, programs, and regulations that balance the need to reduce vehicle accidents, injuries, and deaths through traffic calming and street design with the need to facilitate emergency response times.
- **P12.5 Community Preservation.** Support policies, programs and regulations pertaining to proactive code enforcement methods which reinforce the proper maintenance of properties, buildings and landscapes, and adherence to applicable regulations, while discouraging conditions that foster vandalism and more serious crime.
- **P12.6 Youth Community Safety Partnership.** Support programs that involve young people in discussions about crime and prevention, increase youths' attachment to the community, engage youth in productive activities, and reinforce success in education.
- **P12.7 Fire Code Amendments.** Support policies, programs and regulations that give the Fire Marshall flexibility to approve streets and fire lanes with reduced clearance requirements when other fire safety factors are incorporated into the project (such as street connectivity, traffic safety and the presence of sprinkler systems).
- **P12.9 Neighborhood Safety Strategy.** Support policies, projects, programs and regulations that strengthen partnerships and community-based efforts, such as Neighborhood Watch, to reduce crime through prevention, education and enforcement, and encourage communities to build block-by-block networks to prevent crime, develop social ties and solve common problems.
- **P12.10 Community Involvement in Crime Prevention.** Support policies and programs that involve the community in supporting informal monitoring, participating in legitimate activities and building a sense of ownership and control over neighborhoods.
- **P12.11 Public Safety in Focus Areas.** Support projects, programs, policies and regulations to proactively address public safety concerns as part of community-based planning of Focus Areas.
- **P12.12 Crime Prevention.** Support policies, programs and regulations that implement crime prevention strategies that have demonstrated success, including Crime Prevention Through

Environmental Design (CPTED), Crime-Free Multi-Housing, Business Watch; Neighborhood Watch, iWatch and other similar strategies.

- **P12.13 Safety through Design.** Support policies, projects, programs and regulations that make crime prevention and the maintenance of public safety service levels considerations in design and management of existing and new private and public spaces.
- **P13.1 Inter-City Coordination.** Support regional and subregional efforts to: coordinate as appropriate Continuity of Operations Plan, plans and procedures for Emergency Operations Centers, and emergency response training systems; maintain inter-agency and public communications systems that will provide mutual aid and be reliable during and following an emergency; and, formulate definitive plans and procedures for evacuation of hazard-prone areas and high risk uses.
- **P13.2 Adequate Resources for Emergencies.** Support policies and programs that ensure adequate resources are available in all areas of the City to respond to health, fire and police emergencies.
- **P13.3 Disaster Hazard Reduction.** Support policies, projects, programs and regulations that reduce structural and nonstructural hazards to life safety and minimize property damage and resulting social, cultural and economic dislocations resulting from future disasters.
- **P13.4 Disaster Risk Reduction.** Support programs that promote greater public awareness of disaster risks, personal and business risk reduction, and personal and neighborhood emergency response.
- **P13.5 Community Emergency Preparedness.** Support policies, programs and regulations that ensure the City, its residents, businesses and services are prepared for effective response and recovery in the event of emergencies or disasters, including the provision of information about the current nature and extent of local safety hazards and emergency plans, including evacuation plans and procedures to accommodate special needs populations. Information should be provided in multiple languages to maximize understanding by community members.
- **P13.6 Inter-Department Coordination.** Support policies and programs that improve the coordination of disaster-related programs within City departments.
- **P13.7 New Technologies for Fire and Police Services.** Support policies, programs and regulations which are based on research and evaluation and that implement new technologies and methods to improve the efficiency and effectiveness of fire and police services.
- **P13.9 Nuisance Enforcement.** Support policies, programs and regulations that maintain or strengthen code enforcement as an important tool to uphold community health, safety and welfare consistent with the provisions of the Fullerton Municipal Code.
- **P13.11 Crime Reduction Strategies.** Support policies, programs and regulations to create problem-solving strategies and plans for areas with higher crime rates in the City and to reduce crime by implementing these strategies and plans through a range of measures including increased policing activities, neighborhood partnerships and other innovative programs.

## Libraries

- **P16.6 Fullerton Library System.** Support policies and programs which continuously seek to improve and strengthen the Fullerton Library System as an educational and cultural resource accessible to the entire Fullerton community.
- **P17.17 Fullerton Library.** Support policies, projects and programs that recognize the Fullerton Library as a central element in Fullerton’s citywide educational system.

## Education

- **P17.10 Housing to Support Educational Facilities.** Support policies, projects and programs that facilitate efforts by educational institutions and the private sector to develop an adequate supply of housing for faculty and staff of all schools, as well as adequate housing for college and university students.
- **P17.11 Disadvantaged Communities.** Support policies, projects and programs that address the educational and library needs of disadvantaged communities in Fullerton.
- **P17.13 Shared Facilities and Infrastructure.** Support policies and programs that encourage regular communication and coordination between the City and education providers about facility and infrastructure needs of campuses and nearby neighborhoods and seek opportunities to develop these through collaborative planning and joint-use agreements.
- **P17.15 Mitigate Growth Impacts on School Facilities.** Continue to mitigate the impacts of growth by assessing school impact fees and other appropriate mitigation measures.
- **P17.16 Project Impact Mitigation.** Support programs that foster coordination between the City and local school districts, colleges and universities to assess and mitigate project impacts pertaining to on- and off-campus development.

### 4.9.3 Impact Analysis

#### a. Thresholds of Significance

To determine whether a project would result in a significant impact to air quality, Appendix G of the CEQA Guidelines requires consideration of whether a project would:

1. Result in substantial adverse physical impacts associated with the provision of new or physically altered governmental facilities, or the need for new or physically altered governmental facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives for any of the public services:
  - a) Fire protection
  - b) Police protection
  - c) Schools
  - d) Other public facilities (Libraries and Medical Facilities)

#### b. Methodology

Evaluation of public service impacts was based on a review of documents identifying current levels of service, service standards, consultation with public service providers, such as the Fullerton and University Police Departments, and the Fullerton School District. Impacts on public services that

would result from the Campus Master Plan were identified and compared against future demand associated with project implementation.

### c. Impact Analysis

**Threshold 1a:** Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered fire protection facilities, or the need for new or physically altered fire protection facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives?

**Impact PS-1** IMPLEMENTATION OF THE CAMPUS MASTER PLAN WOULD INCREMENTALLY INCREASE THE SERVICE POPULATION OF THE FFD AND THE NUMBER OF BUILDINGS ON THE CSUF CAMPUS. NEW AND EXPANDED FACILITIES WOULD BE CONSTRUCTED AND OPERATED ENTIRELY ON CSUF PROPERTY IN COMPLIANCE WITH APPLICABLE CSU AND OTHER STATE REGULATIONS GOVERNING FIRE AND LIFE SAFETY. IMPACTS WOULD BE LESS THAN SIGNIFICANT. NO MITIGATION MEASURES ARE REQUIRED.

---

As described in Section 2.0, *Project Description*, the Campus Master Plan would develop more than 5 million gsf of new facility space on campus, in an area currently served by the FFD and which is already served by existing fire and emergency infrastructure such as hydrants, water lines, sprinklers, and call boxes. The FFD reviews development to ensure that necessary fire prevention and emergency response features are incorporated into new projects. All campus and building improvements carried out under the Campus Master Plan would be required to comply with the 2016 Fire and Building Code requirements for construction, access, water mains, fire flows, and hydrants, and would be subject to review and approval by the FFD prior to building permit and certificate of occupancy issuance.

Campus Master Plan implementation would result in the continuation of existing academic programs, extra-curricular activities, and similar housing and instructional facilities and would not fundamentally change the nature of campus operations. Therefore, Campus Master Plan implementation is not anticipated to result in any change in incident calls per capita. Development included in the Campus Master Plan would be covered under the CSUF EOP, which outlines the coordination between CSUF and FFD in the event of an emergency and supporting infrastructure and services. Additionally, local policies, including Fullerton Plan Policies P13.1 and P13.3-7, would continue and improve disaster preparedness efforts and coordination between agencies, supporting the goals of the FFD.

As discussed in Section 4.8, *Population and Housing*, the Campus Master Plan would generate an incremental increase of approximately 7,000 FTES and 1,000 faculty/staff by the 2039 Campus Master Plan horizon year.

Population growth in the FFD service area both on and off-campus would incrementally increase under the Campus Master Plan over a 20-year period. In 2018, FFD responded to 25,693 calls in the City of Fullerton, to the equivalent of 0.18 calls per resident (MCFA 2018). Table 4.9-4 shows the anticipated increase in FFD response calls in the City of Fullerton that would be directly attributed to the Campus Master Plan using the same rate of calls per resident.

**Table 4.9-4 Anticipated Change in FFD Response Call Volume**

	City of Fullerton Population	Annual Response Call Volume	Calls per Resident	FFD Employees per Call Volume
2018 population	143,313	25,693	0.18	-
2019 population	142,824	25,712 <sup>1</sup>	0.18	99.5
Campus Master Plan addition	8,000	-	-	-
2039 population (with Campus Master Plan contribution only)	150,824	27,148 <sup>1</sup>	0.18	105
<i>Difference</i>		<i>1,455</i>		<i>5.5</i>

<sup>1</sup>Estimated based on 2018 calls per resident information.

Source: DOF 2019, MCFA 2018

As shown in Table 4.9-4, the Campus Master Plan would add up to approximately 8,000 residents to FFD’s service area. Using the highly conservative assumption that all new students and faculty living off campus would reside in the City of Fullerton, the total number of FFD response calls Citywide would be anticipated to be 27,148, with the addition of new residents from the Campus Master Plan, an increase of 1,455 calls per year. FFD currently staffs 95.5 trained professional employees. If FFD maintains the same ratio of employees per call volume, FFD would need to increase staff by 5.5 employees.

Planning for new or physically altered FFD stations is based on an assessment of the cumulative need for new facilities and irrespective of the Campus Master Plan. The Campus Master Plan itself would not result in the need for new or expanded facilities. It should also be noted that the Campus Master Plan’s incremental contribution to demand for new fire protection services would be offset by payment of proportionate property taxes and sales taxes to the City of Fullerton by new residents. The City of Fullerton’s ongoing budget process assesses the needs for FFD service and infrastructure to meet goals and standards. In Fiscal Year 2018-19, fire services constituted 21 percent of the City of Fullerton’s General Fund (Fullerton 2018). Likewise, property taxes and sales taxes from new residents in neighboring jurisdictions would support the appropriate fire services agency. Therefore, the Campus Master Plan would not result in the need for new or physically altered police protection facilities and impacts would be less than significant.

### Mitigation Measures

No mitigation measures are required.

### Significance After Mitigation

Impacts associated with the provision or need for new or physically altered fire protection facilities would be less than significant.

**Threshold 1b:** Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered police protection facilities, or the need for new or physically altered police protection facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives?

**Impact PS-2** IMPLEMENTATION OF THE CAMPUS MASTER PLAN WOULD INCREMENTALLY INCREASE THE SERVICE POPULATION OF THE FPD. THE UPD, WHICH HAS PRIMARY JURISDICTION ON CAMPUS, WOULD REDUCE DEMAND FOR FPD SERVICES. FACILITY SPACE FOR THE UPD IS INCLUDED IN THE CAMPUS MASTER PLAN, THE EFFECTS OF WHICH ARE EVALUATED IN THIS EIR. THE CAMPUS MASTER PLAN WOULD NOT RESULT IN THE NEED FOR NEW OR PHYSICALLY ALTERED POLICE FACILITIES. IMPACTS WOULD BE LESS THAN SIGNIFICANT. NO MITIGATION MEASURES ARE REQUIRED.

---

As discussed in Section 4.8, *Population and Housing*, the Campus Master Plan would generate an incremental increase of approximately 7,000 FTES and 1,000 faculty/staff by the Campus Master Plan horizon year. Approximately 3,350 of these students and faculty/staff would be accommodated with on-campus housing, and 4,650 would be accommodated by non-campus housing in the City of Fullerton and neighboring cities.

### On-Campus Impacts

The Campus Master Plan would redevelop buildings and develop new facilities within the existing campus footprint, including on-campus housing for students and faculty/staff. The primary police protection responsibility on the CSUF campus would continue to be provided by the UPD, which has jurisdiction over the campus facilities proposed in the Campus Master Plan. The facilities proposed under the Campus Master Plan would be incorporated into the CSUF EOP. The UPD would continue to have mutual-aid agreements and cooperate with local and state law enforcement agencies, including the FPD, as required by California Education Code section 67381.

Presumably, the need for police services would incrementally increase approximately 30 percent, in association with the student and faculty population increase under the Campus Master Plan until the 2039 horizon year. As previously discussed, the UPD is currently under its staffing goal of one sworn officer per 1,000 students. In order to maintain adequate staffing goals, the UPD would need to employ 40 sworn officers, or 15 more than current staffing levels (Wiley 2019). The Campus Master Plan includes 40,000 gsf of non-academic facility space, a portion of would be used to accommodate sufficient levels of UPD staffing and equipment space. The new facility space is designed to accommodate the increased demand associated with the anticipated increase in the student and faculty/staff population. Despite planned enrollment growth under the Campus Master Plan, the UPD has primary jurisdiction on the campus and would serve to reduce demand for city police protection services. Therefore, impacts to on-campus police facilities would be less than significant.

### Off-Campus Impacts

The Campus Master Plan would not modify or increase the county's or the city's existing service area. The Campus Master Plan would include would incrementally increase the service population of the FPD, as it would be anticipated that students and employees not living on campus would primarily reside in the FPD service area. Table 4.9-5 shows the anticipated increase in FPD response calls in the City of Fullerton that would be directly attributed to the Campus Master Plan using the same rate of calls per resident.

**Table 4.9-5 Anticipated Change in FPD Response Call Volume**

	City of Fullerton Population	Annual Response Call Volume	Calls per Resident	FPD Employees per Call Volume
2019 population	142,824	206,968 <sup>1</sup>	1.50	220
Campus Master Plan addition (off-campus residents only)	4,650	-	-	-
2039 population (with Campus Master Plan contribution only)	147,474	221,211	1.50	235
<i>Difference</i>		<i>14,243</i>		<i>15</i>

<sup>1</sup>Estimated based on 2018 calls per resident information.

Source: DOF 2019, FPD 2015

As discussed in Section 4.8, *Population and Housing*, the Campus Master Plan would result in the incremental addition of 4,650 students and faculty/staff who would reside off-campus in the FPD service area. As shown in Table 4.9-5, the anticipated call volume for the FPD would increase by 14,243 calls. The FPD currently staffs 220 employees. If FPD maintains the same ratio of employees per call volume, FPD would need to increase staff by 15 employees.

Planning for new or physically altered FPD stations is based on an assessment of the cumulative need for new facilities and irrespective of the Campus Master Plan. The Campus Master Plan itself would not result in the need for new or expanded facilities. The incremental contribution to demand for increased FPD protection services from implementation of the Campus Master Plan would be offset by payment of proportionate property taxes and sales taxes to the City of Fullerton by the addition of new residents. In Fiscal Year 2018-19, police services constituted 49 percent of the City of Fullerton’s General Fund (Fullerton 2018). Likewise, property taxes and sales taxes from new residents in neighboring jurisdictions would support the appropriate police protection agency.

Additionally, local policies, including Fullerton Plan Policies P12.2 through P13.11, would continue and improve disaster preparedness efforts, community safety and defensible spaces, and coordination between agencies. Therefore, the Campus Master Plan would not result in the need for new or physically altered police protection facilities and impacts would be less than significant.

## Mitigation Measures

No mitigation measures are required.

## Significance After Mitigation

Impacts associated with the provision or need for new or physically altered police protection facilities would not be significant.

**Threshold 1c:** Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered schools, or the need for new or physically altered schools, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios or other performance objectives?

**Impact PS-3** IMPLEMENTATION OF THE CAMPUS MASTER PLAN WOULD INCREMENTALLY INCREASE THE ENROLLMENT OF STUDENTS IN LOCAL SCHOOLS. HOWEVER, ENROLLMENT WOULD NOT CAUSE SCHOOLS TO EXCEED CAPACITY. THEREFORE, THE CAMPUS MASTER PLAN WOULD NOT RESULT IN THE NEED FOR THE PROVISION OF NEW OR PHYSICALLY ALTERED SCHOOLS. IMPACTS WOULD BE LESS THAN SIGNIFICANT. NO MITIGATION MEASURES ARE REQUIRED.

As discussed in Section 4.8, *Population and Housing*, the Campus Master Plan would generate an incremental increase of approximately 7,000 FTES and 1,000 faculty/staff by the Campus Master Plan horizon year. Approximately 12 percent of undergraduate students of four-year public institutions nationwide are parents with children (Institute for Women’s Policy Research 2019). Using this statistic, it is estimated that 840 FTES would have dependent children. Table 4.9-6 identifies the number of potential K-12 students that would be generated from the 840 FTES and 1,000 faculty/staff using the student generation factors for FSD and FJUSD. This estimate is highly conservative as it assumes all students and faculty/staff would move into the City from other areas and that all students would be new students at schools in the FSD and FJUUSD. The highest student generation rates were used to provide the most conservative analysis. The data was pulled from the City of Fullerton as it was the most convenient metric to use for this analysis.

**Table 4.9-6 Estimated Student Generation**

Grade Level	Student Generation Factor	Dwelling Units	Total Students Generated	Available District Capacity	Exceeds Available Capacity?
Elementary/Junior High School	0.5 <sup>1</sup>	1,840	920	9,523	No
High School	0.205 <sup>2</sup>	1,840	377	1,086	No
Total		1,840	1,297	10,609	No

<sup>1</sup>The generation factor ranges based on location within the City. The highest factor is used.

<sup>2</sup>The generation factor for single-family residences.

Source: The Fullerton Plan EIR (2012)

As shown in Table 4.9-6, FSD and FJUUSD would have available capacity for the estimated number of elementary, junior high, and high school students generated by the Campus Master Plan. Implementation of the Campus Master Plan would not substantially affect the capacity of the nearby public school districts and would not require the construction of new schools or expansion of existing facilities.

Additionally, applicants for new housing construction that would serve an increase in the resident population of Fullerton would be required to pay state-mandated school impact fees (as applied under the 1987 Mitigation Fee Act and codified in Section 66000 of the California State Legislature). Therefore, the Campus Master Plan would not result in the need for the provision of new or physically altered schools, and impacts would be less than significant.

## Mitigation Measures

No mitigation measures are required.

## Significance After Mitigation

Impacts associated with the provision or need for new or physically altered school facilities would be less than significant.

**Threshold 1d:** Would the project result in substantial adverse physical impacts associated with the provision of new or physically altered public facilities, or the need for new or physically altered public facilities, the construction of which could cause significant environmental impacts, in order to maintain acceptable service ratios, response times or other performance objectives?

**Impact PS-4** THE CAMPUS MASTER PLAN WOULD INCLUDE RENOVATIONS AND ADDITIONS TO FACILITY SPACE, INCLUDING POTENTIAL SPACE FOR LIBRARY AND MEDICAL SERVICES, TO MEET DEMAND FROM THE INCREMENTAL INCREASE IN STUDENT AND FACULTY/STAFF POPULATION. THE CAMPUS MASTER PLAN WOULD INCREMENTALLY INCREASE THE DEMAND FOR LIBRARY AND MEDICAL SERVICES IN THE CITY OF FULLERTON AND NEIGHBORING CITIES. HOWEVER, THE CAMPUS MASTER PLAN WOULD INCREASE CAPACITY FOR ON CAMPUS MEDICAL SERVICES REDUCING THE IMPACT TO OFF CAMPUS MEDICAL FACILITIES. IMPACTS WOULD BE LESS THAN SIGNIFICANT. NO MITIGATION MEASURES ARE REQUIRED.

---

## On-Campus Impacts

### *CSUF Libraries*

The Pollak Library on the CSUF campus has recently completed renovation projects, as previously described above in Section 4.9.1, *Setting*. However, these renovations would occur within the existing area and would not expand or build new library space. Presumably, the need for library services would incrementally increase approximately 30 percent, in association with the student and faculty population increase under the Campus Master Plan until the 2039 horizon year. The Campus Master Plan would direct new library services or collections to be included in new or expanded academic and student life facilities as part of its “Activation” concept. These improvements are designed to accommodate the increased demand associated with the anticipated increase in the student and faculty/staff population; therefore, additional on-campus library facilities beyond what is proposed in the Campus Master Plan would not be necessary. Impacts to CSUF library services would be less than significant.

### *CSUF Medical Services*

The CSUF Student Health and Counseling Center is included in the university’s non-academic facility space. Presumably, the need for medical services would incrementally increase approximately 30 percent, in association with the student and faculty population increase under the Campus Master Plan until the 2039 horizon year. The number of annual visits would be expected to increase by a similar rate. Therefore, it is likely that the Student Health and Counseling Center would need additional facility space to accommodate additional staff and services. For information purposes only (not analyzed as an issue under CEQA in this EIR), the Student Health and Counseling Center could utilize a portion of the approximately 40,000 gsf of non-academic facility space directed the Campus Master Plan. Additional on-campus medical facilities beyond what is proposed in the

Campus Master Plan would not be necessary. The Campus Master Plan would increase medical facilities on campus in proportion to the increase in FTES enrollment, reducing off campus impacts to medical facilities. Therefore, impacts to surrounding medical services would be less than significant.

## Off-Campus Impacts

### *Fullerton Public Library and Orange County Public Library*

As previously mentioned in this analysis, the Campus Master Plan would incrementally contribute to approximately 8,000 new residents in Orange County by the 2039 Campus Master Plan horizon year. This population increase may increase the service population of Fullerton Public Library and potentially other libraries in neighboring cities, although all students have access to the Pollack Library, and it is anticipated that most CSUF students will utilize the on-campus library facility. The City of Fullerton and Orange County do not have library facility per capita goals. Expectations to accommodate the increase growth of the City would include, but not be limited to, adding on to existing structures, upgrading amenities to encourage more remote or online usage, additional programming opportunities, and infrastructure upgrades.

Planning for new or physically altered library facilities is based on an assessment of the cumulative need for new facilities and irrespective of the Campus Master Plan. The Campus Master Plan itself would not result in the need for new or expanded facilities. In Fiscal Year 2018-19, library services constituted four percent of the City of Fullerton's General Fund (Fullerton 2018). Future residents from implementation of the Campus Master Plan would pay proportionate property and sales taxes to Fullerton and neighboring cities, which would support investments in new or expanded library facilities and amenities. The Campus Master Plan would not result in the need for new or physically altered library facilities. Therefore, impacts to Fullerton Public Library would be less than significant.

### *Off-Campus Medical Services*

The California industry standards for determining hospital size are the State of California Title 22 and 24 Regulations, which define the minimum sizes of many key "functional units." SJMC's 2010 Specific Plan includes an overall 2030 target bed capacity of 512 beds with a proposed square footage of approximately 1,837 sf per bed, comparable with other similarly sized facilities.

SJMC uses demographic data from SCAG and the DOF, historical trends, and marketplace factors to determine facility needs (SJMC 2010). Population increase directed by the Campus Master Plan, including the 7,000 FTES and 1,000 faculty/staff, would be included in the demographic information used to determine the growth of medical facilities at SJMC and other regional hospitals. Planning for new or physically altered medical facilities, including those at SJMC, is based on an assessment of the cumulative need for new facilities and irrespective of the Campus Master Plan. The Campus Master Plan itself would not result in the need for new or expanded facilities. Therefore, impacts to off-campus medical services would be less than significant.

Therefore, the Campus Master Plan would have no impact on the provision of other new or physically altered library facilities or medical facilities.

## Mitigation Measures

No mitigation measures are required.

## Significance After Mitigation

The Campus Master Plan would not result in the need for new or physically altered library or medical facilities. Impacts would be less than significant.

*This page intentionally left blank.*

## 4.10 Recreation

---

This section assesses the potential for Campus Master Plan implementation to contribute to the physical deterioration of public parks or other recreation facilities or increase demand for those facilities.

### 4.10.1 Environmental Setting

#### CSUF Recreational Facilities

##### *Fullerton Arboretum*

As discussed in Section 2.0, *Project Description*, the 26-acre Arboretum, located in the northeastern portion of campus (shown on Figure 2-2), serves as a resource for research, education and the region's agricultural heritage. Located adjacent to E. Campus Drive to the north and east, parking lots to the south, and athletic facilities to the west, the Arboretum is enjoyed as a regional recreation area as well as a campus research and education facility, containing waterfalls, ponds, trails, and plant collections (see Figure 4.1-1, Photograph 2 in Section 4.1, *Aesthetics*). The Arboretum currently contains a visitor center, Heritage House historic building, plant nursery, and garden sale area. Students from various majors use the space to complete Arboretum-related projects. In 2004, a visitors' center with classrooms, a pavilion, museum, and other modifications was constructed.

The Arboretum contains four major plant collections: Cultivated, Woodlands, Mediterranean, and Desert Collections. Highlights include native vegetation, the rare fruit grove, organic vegetable garden, historic citrus and avocados, Channel Islands Garden, an extensive cycad collection, conifer collection, palm grove, community gardens, and the Children's Garden.

The facility began in a field of the region's iconic orange groves, and officially opened to the public in 1979. On March 24, 1976, a Joint Exercise Powers Agreement (JPA) was created between the Redevelopment Agency of the City of Fullerton and the Trustees of the CSU creating an agency to be known as the Arboretum Authority. Part of the university's contribution to the JPA was to grant the Arboretum Authority use of university owned land for use as an Arboretum. In 1977, the Authority entered into a Site Lease with the University for the use of the University land. The JPA is set to terminate in December 2020, with the Fullerton Arboretum Authority maintaining responsibility for the living collections and the historic collections through December 3, 2020. At that time management and operation of the Arboretum will fall back to CSUF, who plan to administer the facility through CSUF Extension and International Programs. (CSUF 2020a).

#### RESEARCH, CONSERVATION, AND COMMUNITY INITIATIVES

One component to the Arboretum's Level IV ArbNet accreditation is its contribution to research and conservation projects. Its collection features plants from around the world and is made globally accessible through Botanic Gardens Conservation International. The Arboretum is one of only 21 arboretums in the world to be awarded a level IV accreditation for its plant collection and educational value. To earn the highest level of accreditation, arboreta must employ well-qualified tree scientists engaged in publishing sophisticated research, manage living tree collections for the purpose of conservation, and take an active role in supporting tree conservation through the Global Trees Campaign (ArbNet n.d.). CSUF students conduct research in the Arboretum through the

University Stem Initiative, which focuses on biological and agricultural conservation research, and the Urban Agriculture Community-Based Research Experience (U-ACRE), which focuses on sustainable urban food systems and food justice. U-ACRE and its research are funded by the National Institute of Food and Agriculture, a research agency within the USDA. U-ACRE students mentor K-12 students, other college students, and community members in experiential learning. Programs include waste diversion and composting, school and community gardens, addressing food insecurity, integrated workforce development, and sustainable agriculture and productivity (CSUF 2020b).

The Integrating Culinary, Agriculture, and Nutrition (I-CAN) Project is a joint effort by Monkey Business Café, the U-ACRE Project, and the Arboretum. I-CAN provides workforce development for young people who have recently been emancipated from the foster care system. Monkey Business Café is a unique farm-to-table enterprise that integrates the Arboretum's urban farm with a neighborhood restaurant. Coupled with applied research activities conducted by U-ACRE, this unique program prepares former foster youth for career pathways through a complete farm-to-table training program. Participants from Monkey Business Café grow produce in the Arboretum farm, in a collaborative mentorship with Arboretum staff and U-ACRE faculty and students, as well as service-learning students from several CSUF classes. The participants then use the produce at Monkey Business Café, where they receive training in culinary arts including recipe development and food preparation. The participants also work with U-ACRE faculty and students to conduct nutritional analysis of Monkey Business Café menu items and product line using professional software at CSUF (CSUF 2020c).

#### **ENVIRONMENTAL EDUCATION PROGRAM**

The Arboretum offers the Environmental Education Program, which is a grant-funded, curriculum-based outdoor science program geared towards grades three through seven that is free for educators. Children learn science in a "living laboratory." The Environmental Education Program has served more than 65,000 students (CSUF 2017).

#### **CLASSES AND WORKSHOPS**

The Arboretum offers fee-based classes for students and the broader community on bonsai trees, composting, culinary arts, forest bathing, medicinal and edible plants, nature photography, painting, and yoga. The Arboretum also offers presentations about the plant collections and history to groups.

#### **HERITAGE HOUSE**

Dr. George Crook Clark, one of Fullerton's pioneer doctors, built the house in 1894. This house was originally located at the corner of Amerige Avenue and Harvard (Lemon) Street in Fullerton. Through the decades, it deteriorated. The city purchased the house, which was in danger of demolition thanks to a street-widening project, in 1972, where it was relocated to the Arboretum. The Friends of the Fullerton Arboretum restored and furnished the interior of the house, which currently serves as a museum of family life and medical practice in the 1890s. The redwood and fir structure is an example of Eastlake-Victorian-style architecture, prevalent in Orange County during the late 1800s. The Heritage House yard includes an 1880s outhouse, a pump house circa 1895 and a windmill (CSUF 2020a).

## ORANGE COUNTY AGRICULTURAL AND NIKKEI HERITAGE MUSEUM

The Orange County Agricultural and Nikkei Heritage Museum is reminiscent of packing houses used by the citrus industry in the early 1900s. Design elements also resemble existing structures and gardens on the grounds. The energy-efficient museum complex includes an exhibit space, classrooms and an outdoor pavilion that can accommodate 350 people for special events. Classrooms can be arranged in multiple configurations to accommodate classes and meetings. Museum exhibits focus on southern California's agricultural, natural, and social history (CSUF 2020a).

### *Campus Recreational Facilities*

In addition to the Arboretum, CSUF contains more than two acres (approximately 95,000 sf) of on-campus active recreational facilities, including playing fields, recreation center, athletic courts, and a swimming pool. Facilities are available for use by students, faculty, staff, and affiliates. As described in Section 2.0, *Project Description*, and shown on Figure 2-5, a large portion of the northern half of campus consists of facilities to support CSUF's Athletics programs, namely Titan Stadium, Goodwin Field, Anderson Family Field, and the Titan Sports Complex. Many of the athletic facilities are bordered by operations service buildings to the west, paved parking lots to the north, Gymnasium Drive to the south, and the Fullerton Arboretum and campus housing to the east. Recreational facilities in the southern portion of campus include the Titan Bookstore, Titan Student Union, and the Student Recreation Center.

CSUF Associated Students oversees recreational activities on campus outside of the CSUF's Athletics programs. The Student Recreation Center, located on the west side of campus, serves as a primary resource for recreational activities on campus and programs that offer off-campus recreation activities. The CSUF Athletics department oversees 10 university sports teams.

## City of Fullerton Parks and Recreational Facilities

The City of Fullerton contains approximately 28 miles of recreational trails. Parks and recreational facilities in the city are managed by the Parks and Recreation Department, which oversees more than 50 parks, 15 pedestrian and equestrian trails, four neighborhood centers, and event and recreation spaces. The City's parks and open space lands generally include publicly owned properties, which include regional, specialized, or local park facilities; areas under private ownership designed for outdoor recreational activities; and sites in a natural or unimproved state. The Department's land use designation is applied to public parks and recreational facilities, privately owned recreational facilities, landscaped and greenbelt areas, open space conservation areas, public golf course facilities, and areas that are subject to flood and/or seismic hazards (Fullerton 2019a).

The 2019 population of the City is 142,824 (DOF 2019). According to the Trust for Public Land, six percent of Fullerton's land (856.32 acres) dedicated to parks and recreation (Trust for Public Land 2018). Using these figures, the City currently has a park-to-population ration of 6.0 acres per 1,000 people. Public school facilities, although not formally included in the improved public open space category, offer joint-use recreational resources and facilities such as playgrounds, athletic fields, gymnasiums, auditoriums, sports fields, and swimming pools.

Major recreation facilities are listed below:

- The Fullerton Center, located at 340 W. Commonwealth Avenue, is approximately 3.3 miles from CSUF via local roadways. It is the main recreation and event facility in the city.

- The Muckenthaler Cultural Center, located at 1201 W. Malvern Avenue, is approximately 3.9 miles from CSUF via local roadways. It offers year-round art exhibitions, educational programs, events, classes and a gift shop.
- The Fullerton Museum Center, located at 301 N. Pomona Avenue, is approximately 2.6 miles from CSUF via local roadways. The Museum presents multidisciplinary exhibitions and educational programs in the areas of history, science, art and humanities.
- Independence Park is located at 801 W. Valencia Drive, is approximately 4.1 miles from CSUF via local roadways. It contains the Janet Evans Swim Complex, racquetball courts, skate park, gymnasium, and a farmer's market.
- The Janet Evans Swim Complex is managed by the Fullerton Aquatics Sports Team Inc. in Partnership with the City of Fullerton and has a main Olympic-size 50-meter competition pool and a seven lane 25-yard teaching pool.

The nearest City parks to CSUF include Acacia Park approximately 0.5 mile east, Craig Regional Park approximately 0.5 mile north, and Fullerton Greenbelt Park approximately 700 feet west of campus. All trails are located in the northern area of the city, with the exception of the Juanita Cook Greenbelt and Hiltcher Park Trail. The Union Pacific right-of-way, which would run almost entirely through the city, is listed as a "Backbone Trail" but is not yet constructed. The Union Pacific railway line was developed through Fullerton in the 1920s, but this branch was abandoned in the 1990s (Yanity 2019).

Additionally, other public colleges, such as Fullerton Community College and private educational institutions in the city, contain athletic and recreational facilities for students, faculty, and the public.

## 4.10.2 Regulatory Setting

CSUF is an entity of the CSU, which is a constitutionally created state agency, and is therefore not subject to local government planning and land use plans, policies, or regulations. CSUF may consider, for informational purposes, aspects of local plans and policies for the communities surrounding the campus when it is appropriate. The Campus Master Plan would be subject to state and federal agency planning documents described herein but would not be bound by local or regional planning regulations or documents such as The Fullerton Plan or municipal code.

### Local

#### *The Fullerton Plan (2012)*

The Fullerton Plan, aims to achieve the City's vision by aligning city efforts, connecting with local and regional partners and advocating for community engagement. The plan provides a framework for the community and covers different sectors such as economics, demographics, and physical characteristics. Specific policies in The Fullerton Plan that relate to parks and recreational facilities and relevant to the Campus Master Plan include the following:

#### *GOAL 1: Resilient and vital neighborhoods and districts.*

- **P1.4 Connection and Integration of Uses.** Support projects, programs and policies to improve connections between housing, shops, work places, schools, parks and civic facilities, and integrate uses where possible and appropriate. (See Chapter 4: Mobility for related policies.)

- **P1.13 Universal Design.** Support projects, programs, policies and regulations to produce buildings and environments that are inherently accessible to people of all abilities.

*GOAL 5: A balanced system promoting transportation alternatives that enable mobility and an enhanced quality of life.*

- **P5.10 Easements and Rights-Of-Way.** Support projects, programs, policies and regulations to use public easements and rights-of-way along flood control channels and/or inactive railroads as part of the multi-modal network.

*GOAL 14: An environment with opportunities for community health and wellbeing.*

- **P14.4 Community Gardens.** Support policies, projects, programs and regulations that encourage community gardens that are operated and managed by local volunteers and that provide for small-scale local food production in areas convenient to residents.
- **P14.5 Opportunities for Physical Activity.** Support policies, projects, programs and regulations that provide for convenient and safe areas that facilitate opportunities for physical activity such as parks, trails, open space, safe streets for bicycling, safe sidewalks for walking, and recreational facilities for residents of all ages and abilities. (See Chapter 12: Parks and Recreation for related policies.)
- **P14.6 Amenities Within a Walkable Distance.** Support policies and regulations involving land use and zoning changes that would provide access to daily retail needs, recreational facilities, and transit stops within a walkable distance (i.e., a quarter- to a half-mile) of established residential uses.

*GOAL 15: Parks, recreational facilities, trails, and programs that promote a healthy community and a desirable quality of life.*

- **P15.1 North Orange County Parks and Recreation Collaboration.** Support regional and subregional efforts to establish and maintain a collaboration of parks and recreation programs, to share best practices, discuss solutions to common challenges, and explore opportunities for connecting and expanding trails, joint use of parks and recreational facilities, and recreation programming for participating cities.
- **P15.2 Existing Parks and Recreation Resources.** Support policies, projects, programs and regulations that preserve, protect, maintain and enhance Fullerton's existing parks, recreational facilities and trails.
- **P15.3 Access to Recreation Programs.** Support policies, projects, programs and regulations that strengthen access to quality recreation programs which, in turn, promote a sense of community and a higher quality of life for Fullerton residents.
- **P15.4 Partnerships with Other Agencies.** Support policies and programs that bolster appropriate partnerships between the City and agencies, including educational institutions, railroad franchises, utility companies, etc., to secure, co-locate or otherwise share parks, recreational facilities and trails on school campuses, within public easements and in other similar locations.
- **P15.5 Partnerships with Private Ventures.** Support policies, projects, programs and regulations allowing commercial ventures as ancillary uses in Fullerton parks and recreational facilities when determined they are context-appropriate, complementary to the facilities, viewed as a public benefit, and generate revenue that supports parks and recreational programs and facilities.

- **P15.6 Accessible Citywide Park System.** Support policies, programs and regulations that facilitate the planning, design and development of an extensive system of parks (passive and active), recreational facilities, and trails that meets the current needs of Fullerton residents and is accessible and within a 15-minute walking distance (i.e., one-quarter to one-half mile) of every Fullerton resident. (Also see Chapter 19: Open Space and Natural Resources, P24.10 Trail Linkages to Open Space.)
- **P15.7 Park-to-Population Ratio.** Support projects and programs that contribute to a citywide minimum park-to-population ratio of 4 acres per 1,000 people.
- **P15.8 Recreation Programming.** Support programs that promote recreational activities that facilitate healthy and community-oriented lifestyles for Fullerton residents.
- **P15.9 Community-Based Parks and Recreation Program.** Support policies, projects and regulations that reinforce a City commitment to a community-based parks and recreation program that maximizes opportunities to share information, promote two-way communication, and involve the Fullerton community and user groups in integrating a broad and diverse range of interests and concerns pertaining to the planning, development, enhancement and rehabilitation of parks, recreational facilities and trails.
- **P15.10 Park Dwelling Fee.** Support policies and regulations which require new construction of dwelling units in the City to pay a park dwelling fee that provides for the creation and enhancement of open space, parks and recreational facilities accessible to all residents.
- **P15.11 Park Renovation Considerations.** Support projects and programs for renovating or improving existing parks that consider the needs and desires of the surrounding neighborhoods and districts.
- **P15.12 Parks and Recreational Facilities in Focus Areas.** Support projects, programs, policies and regulations to consider parks, recreational facilities and trails as part of community-based planning of Focus Areas.
- **P15.13 Context-Sensitive Design.** Support projects and programs incorporating design features in parks, recreational facilities and trails that reflect the sense of place and unique characteristics of the local context.
- **P15.14 Compatibility with Adjacent Properties.** Support policies and programs pertaining to public parks, recreational facilities and trails that interface with private property that advance reciprocal compatibility through collaboration, programming and design.
- **P15.15 Community Involvement.** Support projects and programs that involve the Fullerton community in park improvement plans through workshops, focus group discussions, and interviews and surveys with park users.
- **P15.16 Relationships to Development Projects.** Support projects located adjacent to or near parks and trail facilities that facilitate connections and reinforce a positive relationship between private property and public parks and trails.

*GOAL 24: Responsible management of open spaces balanced with the healthy functioning of environmental systems.*

- **P24.1 Management and Maintenance.** Support projects, programs and policies to coordinate with existing regional park districts, the private sector and nonprofit institutions to manage and maintain regional open spaces.
- **P24.2 Land Trusts.** Support projects, programs and policies to encourage the establishment of land trusts to help preserve significant open space within the region.

- **P24.3 Access and Use of Open Space.** Support projects, programs, policies and regulations to increase access to and use of open space resources while respecting the natural environment.
- **P24.4 Accessibility for All.** Support projects, programs, policies and regulations to ensure that, when natural topography allows, public open spaces are accessible to people of all abilities.
- **P24.5 Long-Range Needs.** Support projects, programs, policies and regulations to preserve areas of open space sufficient to meet the long-range needs of the City.
- **P24.6 Watershed Management.** Support projects, programs, policies and regulations to manage open space watersheds to limit potential fire and erosion hazards.
- **P24.7 New Open Space.** Support projects, programs, policies and regulations to create open space as funding and other opportunities become available.
- **P24.8 Environmentally Sensitive Areas.** Support projects, programs, policies and regulations to preserve the environmentally sensitive areas of public open spaces.
- **P24.9 Passive Open Space.** Support projects, programs, policies and regulations to encourage diverse, environmentally-sensitive, passive open spaces.
- **P24.10 Trail Linkages to Open Space.** Support projects, programs, policies and regulations to promote recreational trails and the bikeway system to link open spaces to public areas and neighborhoods.
- **P24.11 Open Space in Focus Areas.** Support projects, programs, policies and regulations to evaluate increasing urban and natural open spaces as part of community-based planning of Focus Areas.
- **P24.12 Environmental Impact of Support Facilities.** Support projects, programs, policies and regulations to limit the construction of facilities in open space areas and to design necessary improvements, such as fire roads, access roads, and parking facilities, to minimize environmental impacts and maintain the visual qualities of the open space.
- **P24.13 Maintenance of Sensitive Areas.** Support programs, policies and regulations to require maintenance of environmentally-sensitive areas by qualified/trained personnel and/or contractors.

#### *City of Fullerton Municipal Code*

California Government Code Section 66477, Subdivision Map Act, referred to as the Quimby Act, permits local jurisdictions to require the dedication of land and/or the payment of in-lieu fees solely for park and recreation purposes. The City of Fullerton Community Development Department collects fees from new residential, commercial, and other buildings for the purposes of funding public services, as directed by Fullerton Plan Policy P15.10. Section 21.12.040 of the Municipal Code states that all money collected as fees for parks from residential building permit construction shall be deposited in the park dwelling fund and shall be used solely for the acquisition, development, improvement, and maintenance of public parks and recreational facilities in the City, as proposed by the City's Five-Year Capital Improvement Program. The Park Dwelling Fee for Fiscal Year 2018-19 is \$12,020 per dwelling unit. (Fullerton 2019b).

### 4.10.3 Impact Analysis

#### a. Thresholds of Significance

To determine whether a project would result in a significant impact to Recreation, Appendix G of the CEQA Guidelines requires consideration of whether a project would:

Increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated.

Include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment.

1. **a. Methodology**

2. Evaluation of potential recreation impacts was based on a review of documents identifying current level of service standards for the local jurisdictions, including the Fullerton Plan (as general reference points). Impacts on recreation that would result from the project were identified by comparing existing park capacity and facilities against future demand associated with project implementation.

**b. Impact Analysis**

<p><b>Threshold 1:</b> Would the project increase the use of existing neighborhood and regional parks or other recreational facilities such that substantial physical deterioration of the facility would occur or be accelerated?</p> <p><b>Threshold 2:</b> Does the project include recreational facilities or require the construction or expansion of recreational facilities which might have an adverse physical effect on the environment?</p>
--

**Impact REC-1** THE CAMPUS MASTER PLAN WOULD INCREMENTALLY DEVELOP OR SUSTAIN NEW RECREATION FACILITIES, INCLUDING 100,000 SF OF NEW FACILITY SPACE IN THE FULLERTON ARBORETUM, EVENT CENTER, AND RECREATION AREAS, THAT WOULD ADEQUATELY SERVE THE INCREASE IN CAMPUS POPULATION. ADDITIONALLY, THE CAMPUS MASTER PLAN WOULD NOT RESULT IN SIGNIFICANT DETERIORATION OF OFF-CAMPUS FACILITIES. IMPACTS WOULD BE LESS THAN SIGNIFICANT. NO MITIGATION MEASURES ARE REQUIRED.

As discussed in Section 4.13, *Population and Housing*, the Campus Master Plan would generate an incremental increase of approximately 7,000 FTES and 1,000 faculty/staff by the 2039 Campus Master Plan horizon year. Approximately 3,350 of these students and faculty/staff would be accommodated with on-campus housing, and 4,650 would be accommodated by non-campus housing in the City of Fullerton and neighboring cities. All students and faculty would access on-campus and off-campus open space and recreation opportunities. Impacts to parks and recreation facilities on and off-campus are discussed below.

**Fullerton Arboretum**

Due to the proposed increase in students, faculty, and staff using CSUF facilities, the Arboretum would be expected to have an increase in number of annual visitors, events, and educational and research activities. The Campus Master Plan maintains the Arboretum as a strong contributor to promoting community within campus and with the surrounding neighborhoods and directs improvements to include expanded programming for academic uses as well as opportunities for relaxation and enjoyment. The Campus Master Plan would direct development that supports the mission of the Arboretum, protect its assets, and allows the facility to be self-sustaining. The Campus Master Plan would develop 100,000 gsf of improved and replaced facility space in the Arboretum, including existing administration space, green house, and pavilion, that would augment

existing facilities and support its programs and mission. Updates to existing Arboretum facilities are needed to support the facility's mission and to continue the integration of the Arboretum with student, faculty, and community needs

The Campus Master Plan also includes improving access and connections throughout the campus and planning for deliberate connection to pedestrian and bicycle circulation paths, such as the proposed Green Loop that connects the center of campus. Improved connections on campus would facilitate classroom activity in the Arboretum and recreational and relaxation opportunities for the campus population. Considerations for the Arboretum include:

- Recognizing and preserving the importance of the Arboretum as a campus and community asset
- Keeping a secure boundary around the Arboretum to protect its historic and educational assets by maintaining the existing fence
- Connecting the Arboretum to other recreational and open space areas on campus using the Green Loop
- Extending the natural beauty and identity of the Arboretum to open spaces throughout the campus
- Developing new or changing existing programs to better integrate the arboretum into the curriculum of the university
- Increasing its ability to assist overall campus sustainability, such as expanding the composting facility to be able to compost waste from the campus, using and/or producing mulch to reduce the need for chemical fertilizer, and developing a biochar production facility to aid carbon sequestration
- Utilizing the Arboretum for integrating a “working/learning” campus, using the physical campus as a means for hands-on education

The continued maintenance and preservation of the Arboretum, as directed by the Campus Master Plan, would offset potential deterioration by increased use of its trails or facilities. The proposed improved facility space in the Arboretum which would offset impacts to facilities from increased visitation and enhance its functional ability and integration within the campus. Impacts to the Arboretum would be less than significant.

## **CSUF Open Space and Recreation Facilities**

The Campus Master Plan would incrementally increase the use of existing open space and recreational facilities. In order to develop a design concept that focuses on the physical and emotional well-being of the campus population and meet increased demand for recreational and open spaces, the Campus Master Plan would incrementally develop six signature forms of open space:

- **Plazas:** gathering spaces for small or large groups or outdoor events, concentrated on the southern half of campus.
- **Courtyards:** small, semi-private areas of open space that may act as an extension of academic or residential space, concentrated in proposed residential areas and academic core.
- **Greens:** large gathering areas with permeable surfaces, three in the center of campus and one in a residential area.
- **Art and Identity:** public art located throughout campus with attention to campus edges.

- Front Porches: building entrances that blend indoor and outdoor spaces, namely at academic buildings.
- Arboretum: preservation of CSUF's most significant open space.

As shown in Figure 4.10-1 below, one of the major tenants of the Campus Master Plan is a "Green Loop" pathway that connects major activity areas and also provides recreational opportunities as a walk/bike path. The Campus Master Plan would also create walk/bike pathways along a "hierarchy of axes" throughout the campus. The Campus Master Plan would also develop a new 254,100-gsf event center and a 72,762 gsf Innovation Hub, which would provide space for athletics, intramural sports, student programming, and community events. The additional and improved facilities would distribute use and decrease demand on existing facilities.

Implementation of the Campus Master Plan would improve recreational opportunities compared to existing conditions and would provide adequate recreational opportunities for the projected increase in students, faculty, and staff. Impacts to on-campus open space and recreation facilities would be less than significant.

## City of Fullerton

Although the Campus Master Plan and CSUF policies are not under authority by local jurisdictions, local regulations are included in this section of the EIR because it is assumed that the majority of the increased population associated with the Campus Master Plan would reside in the City of Fullerton and to a lesser extent, neighboring cities such as Buena Park, La Habra, and Placentia (a detailed description of population and housing assumptions is included in Section 4.13, *Population and Housing*).

Fullerton Plan Policy P15.7 instructs a citywide minimum park-to-population ratio of four acres per 1,000 people and the City currently has a ratio of 6.0 acres per 1,000 people. The Campus Master Plan would accommodate 8,000 students and faculty/staff housing by the 2039 horizon year. Although all students, faculty, and staff may access these facilities, the highest demand would likely occur from the campus population living in non-campus housing. Under the conservative assumption that all new residents, both residing on and off-campus, visited park space in the City of Fullerton, the impact from the Campus Master Plan would change the city's park-to-population ratio to 5.7 acres per 1,000 residents, a decrease of 0.3 acre per 1,000 residents but still above its park-to-population goal.

Figure 4.10-1 Proposed Campus Master Plan Open Space (Revised)

In addition, further residential development in nearby communities, including in the City of Fullerton, would be required to meet Quimby Act requirements, which ensure adequate open space is provided based on anticipated population. The potential need for new recreational facilities would be addressed at the site of the new housing development or through the collection of development impact fees. The City's development program, including parks and recreational facilities, is regularly evaluated and impact fees collected, as determined necessary, would be used to provide additional recreational opportunities. Therefore, any necessary recreational facility improvements within neighboring communities would either be addressed through compliance with the Quimby Act and/or through the collection of development impact fees of the respective community.

Consequently, the potential increased population associated with the Campus Master Plan would not cause substantial deterioration of off-campus recreation facilities or result in the need for the construction of new facilities which might have an adverse physical effect on the environment. Because the project would include maintenance, improvement, and construction of parks and recreation facilities to serve an associated increase in population and would not require the construction or expansion of facilities beyond what is proposed in the Campus Master Plan, this impact would be less than significant.

### **Mitigation Measures**

No mitigation is required.

### **Significance After Mitigation**

Impacts would be less than significant without mitigation.

## 4.11 Transportation

---

This section describes the existing transportation system serving and surrounding CSUF and analyzes and evaluates impacts pertaining to VMT; transit, bicycle, pedestrian, and facilities; roadway hazards; and emergency access resulting from implementation of the Campus Master Plan. The analysis in this section is based on the TIS prepared for the Campus Master Plan project by Fehr & Peers (January 2020). The complete TIS is included in Appendix M of this document.

### 4.11.1 Environmental Setting

#### a. Project Study Area

The project TIS (Appendix M) evaluated the traffic impacts of campus growth and defined the study area for traffic and transportation analyses to include the main CSUF campus and 13 roadway segments surrounding the campus. The TIS area for the traffic analysis is shown in Figure 4.11-1, and includes the following roadway segments:

- South State College Boulevard from SR 91 to Fender Avenue
- South State College Boulevard from Fender Avenue to Nutwood Avenue
- North State College Boulevard from Nutwood Avenue to Yorba Linda Boulevard
- North State College Boulevard from Yorba Linda Boulevard to SR 90
- Nutwood Avenue from North State College Boulevard to SR 57
- Nutwood Avenue/Primrose Avenue from SR 57 to Bradford Avenue
- Yorba Linda Boulevard from North State College Boulevard to Placentia Avenue
- E. Chapman Avenue from North State College Boulevard to SR 57
- E. Chapman Avenue from SR 57 to Bradford Avenue
- Associated Road from SR 90 to Bastanchury Road
- Associated Road from Bastanchury Road to Yorba Linda Boulevard
- Commonwealth Avenue from Nutwood Avenue to Chapman Avenue
- Commonwealth Avenue from Chapman Avenue to South State College Boulevard

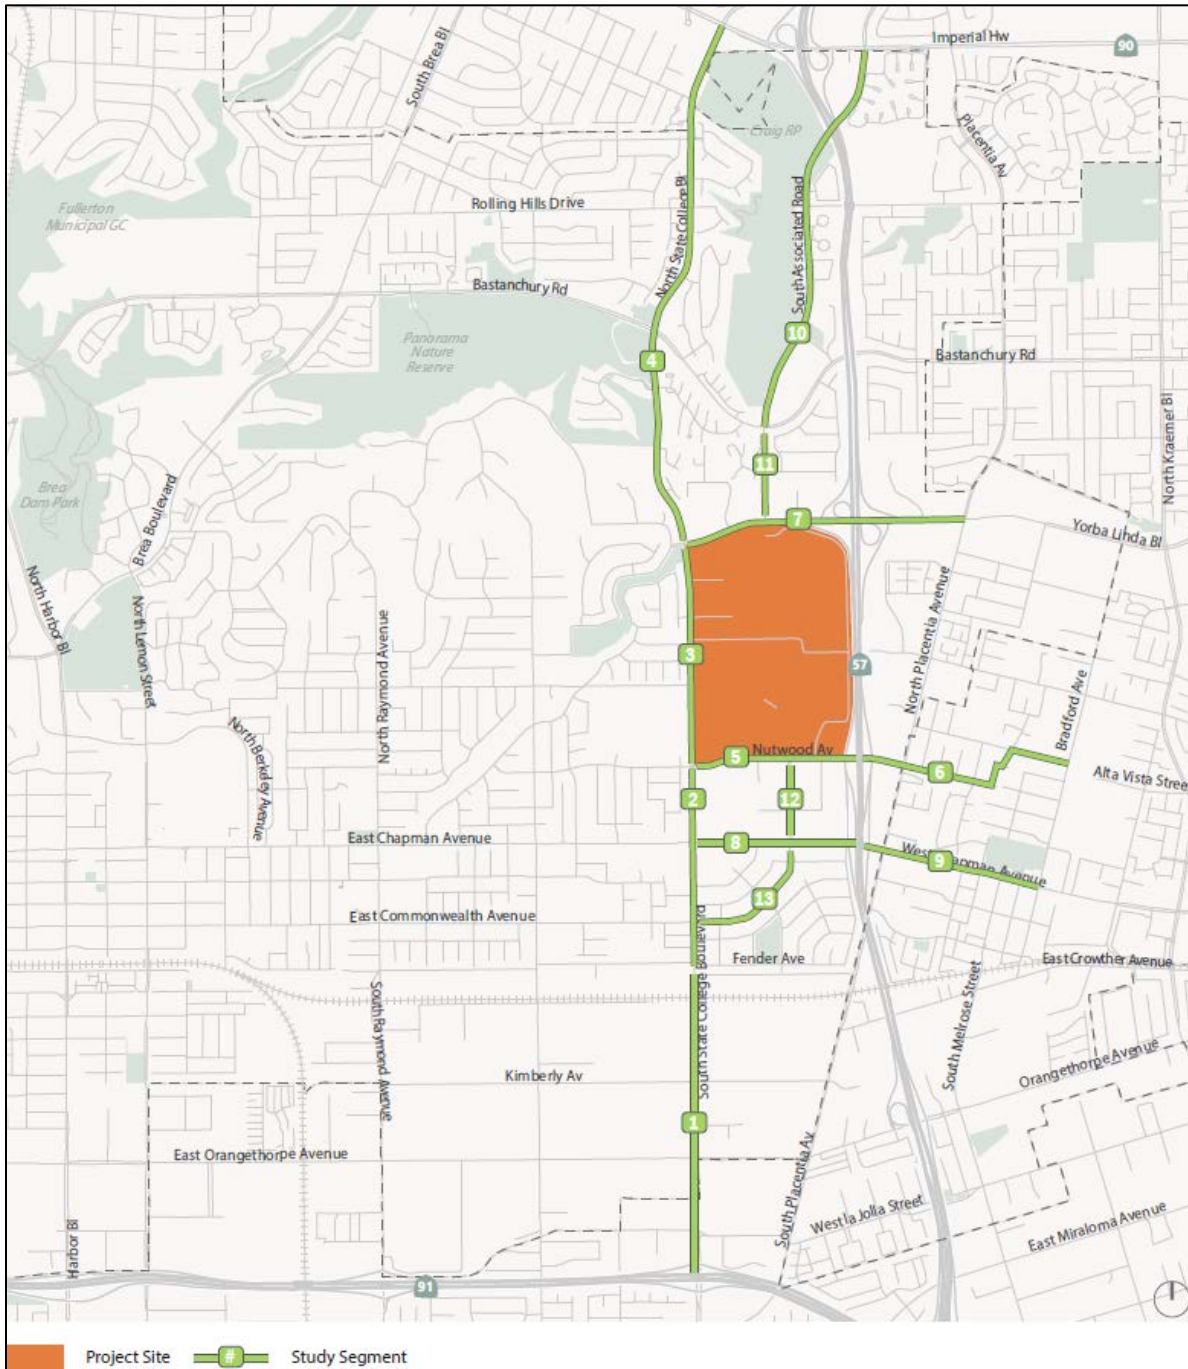

#### b. Existing Roadway Network

##### *Regional Roadway System*

Regional access to the CSUF campus is provided by SR 57, SR 90, and SR 91. Brief descriptions of the regional roadways are included in the TIS (Appendix M), and summarize below:

- **SR 57 (Orange Freeway)** provides north-south regional access between Orange and Los Angeles counties, and contains five travel lanes and one carpool lane in each direction. SR 57 borders the CSUF campus to the east and provides access to the CSUF campus via the Yorba Linda Boulevard and Nutwood Avenue interchanges.

Figure 4.11-1 Project Site Vicinity and Analysis Locations

Source: Fehr & Peers 2020.

- **SR 90 (Imperial Highway)** provides east-west regional access between Orange and Los Angeles counties, and contains three travel lanes in each direction. SR 90 connects to SR 57 north of the campus.
- **SR 91 (Riverside Freeway)** provides east-west regional access between Los Angeles, Orange, and Riverside counties. SR 91 contains four travel lanes and one carpool lane in each direction. SR 91 connects to SR 57 south of the campus.

### Local Roadway System

The City of Fullerton utilizes a roadway functional classification system to provide a logical framework for the design and operation of the city’s roadway network. The five roadway classifications are shown in Table 4.11-1.

**Table 4.11-1 Roadway Functional Classifications**

Facility Type	Number of Travel Lanes (Minimum)	Right-of-Way Width	Typical Daily Volume
Major Arterial Highway	6 divided	100 to 120 feet	30,000 to 90,000
Primary Arterial Highway	4 divided	80 to 84 feet	20,000 to 33,000
Secondary Arterial Highway	4 undivided	80 to 84 feet	16,000 to 22,000
Local Collector Street	2 undivided	60 to 84 feet	10,000
Residential Street	2 undivided	Varies, typically 50 to 60 feet	Varies

Source: City of Fullerton 2012

The principal local network of streets serving CSUF include Nutwood Avenue to the south, North State College Boulevard to the west, and Yorba Linda Boulevard to the north. The following discussion provides a brief description of these key local streets. The descriptions are based on an inventory of existing roadway conditions includes in the TIS (Appendix M), which also contains a description of all local roadways in the study area.

- **Nutwood Avenue** is a six-lane Primary Arterial Highway, south of the CSUF campus. It provides east-west mobility and direct access to the campus. The posted speed limit is 35 miles per hour (MPH). Traffic signals are located at the intersections with North State College Boulevard, Titan Drive, Commonwealth Avenue, and Langsdorf Drive. Nutwood Avenue provides direct access to internal roadways within the Campus Master Plan area. On-street parking is not permitted on Nutwood Avenue.
- **North State College Boulevard** is a six-lane Major Arterial Highway, west of the CSUF campus. It provides north-south mobility with direct access to internal roadways within the Campus Master Plan area. The posted speed limit is 40 MPH. Traffic signals are located at the intersections with Yorba Linda Boulevard, Dorothy Lane, Arts Drive, and Nutwood Avenue. On-street parking is not permitted on North State College Boulevard.
- **Yorba Linda Boulevard** is a six-lane Major Arterial Highway, north of the campus. It provides east-west mobility with direct access to internal roadways within the Campus Master Plan area. The posted speed limit is 40 MPH. Traffic signals are located at the intersections with North State College Boulevard and Associate Road/Campus Drive. On-street parking is not permitted on Yorba Linda Boulevard.

### c. Transit System

Transit service in the TIS area is provided by CSUF, Orange County Transportation Authority (OCTA), Metrolink, and Amtrak.

## CAMPUS SHUTTLE

CSUF offers free shuttle service from the First Evangelical Free Church (2801 N. Brea Boulevard in Fullerton) to the Parking and Transportation Services Office (along North State College Boulevard, just north of the State College Boulevard and Ranch Road/Corporation Drive intersection), which is an approximately two-mile distance each way. The shuttle service runs every 10 to 15 minutes, Monday through Thursday, between approximately 7:30 a.m. and 7:30 p.m.

## ORANGE COUNTY TRANSPORTATION AUTHORITY

OCTA provides public transportation service throughout Orange County, and OCTA's service area includes the CSUF campus. In 2018, OCTA saw a ridership total of approximately 38.5 million riders, the lowest ridership OCTA had seen in 30 years (VoiceofOC 2019). In 2019, OCTA proposed several changes to transit services including service changes to more than 20 bus routes that have seen underutilized ridership. According to the Voice of Orange County, a non-profit news agency in the County, reported that Route 53 saw around 6,000 boardings as of December 2018, along with Route 206 seeing a weekly boarding average of 47 passengers and Route 213 with an average of 44 passengers a week. The Orange County Register (OCR) expects the proposed bus changes to generate approximately 107,000 additional annual boardings (OCR 2019).

The TIS (Appendix M) provides a list of all OCTA bus routes that run within two miles of CSUF. OCTA Routes 24, 26, 57, 123, 153, and 213 all serve the CSUF campus (CSUF 2019a). Starting in 2020, Route 57 will run every 12 to 13 minutes along with Route 57x which will come approximately every 16<sup>th</sup> minute and 32<sup>nd</sup> minute of the hour (OCTA 2020). These lines operate from 6:00 a.m. to 6:00 p.m. Monday through Friday. Route 213 runs every 20 minutes and runs only during peak traffic hours. Route 153 services 42 stops with frequencies varying and runs from 7:00 a.m. to 7:00 p.m. OCTA bus routes, frequencies and headways change often due to merging bus routes and the addition/elimination of bus services.

In February 2020, OCTA combined Route 24 with Route 21 to become the new Route 123. When east of the Buena Park Metrolink Station, Route 123 travels predominantly down Malvern Avenue and Chapman Avenue past CSUF using the old Route 24 routing and terminates at the Anaheim Canyon Metrolink Station instead of the Village of Orange in the east. When traveling west of the Buena Park Metrolink Station, it uses the old Route 21 alignment on Valley View Boulevard and terminates at the Golden West Transportation Center in Huntington Beach. Route 123 continues to have approximately one-hour headways between 5:30 a.m. and 9:00 p.m. on weekdays. This route does not operate on weekends.

CSUF offers discounted OCTA bus passes to students, faculty, and staff to encourage bus use. The following is a listing of existing bus stops along the perimeter of the CSUF campus and the routes that serve the stops:

- Yorba Linda-Campus (OCTA Stop ID 7879), located near the southeast corner of the Yorba Linda Boulevard and Associated Road/Campus Drive intersection on the north end of campus, served by Route 153 (Brea to Anaheim).
- State College-Corporation (OCTA Stop ID 1934), located along the east side of North State College Boulevard just north of the North State College Boulevard and Ranch Road/Corporation Drive intersection, served by Routes 57 and 57x (Brea to Newport Beach).
- State College-Campus (OCTA Stop ID 1933), located along the east side of North State College Boulevard just north of the North State College Boulevard and Dorothy Land intersection, served by Routes 57 and 57x.

- State College-Nutwood (OCTA Stop ID 1932), located along the east side of North State College Boulevard just north of the North State College Boulevard and Nutwood Avenue intersection, served by Routes 57 and 57x.
- Nutwood-Commonwealth (OCTA Stop ID 1864), located along the north side of Nutwood Avenue at the intersection of Nutwood Avenue and Commonwealth Avenue, served by Route 123\_24 (Buena Park to Orange).

#### **METROLINK AND AMTRAK RAIL SERVICE**

Fullerton Station (120 E. Santa Fe Avenue) is located approximately three miles southwest from campus. Metrolink and Amtrak operate rail services throughout Southern California, with stops at the Fullerton Station.

Metrolink provides regional rail service in the Greater Los Angeles region and other parts of Southern California. Metrolink's Orange County Line runs from Oceanside to Los Angeles between approximately 4:35 a.m. and 11:55 p.m. on weekdays and between approximately 8:15 a.m. and 8:00 p.m. on weekends. On weekdays, the Orange County Line stops at Fullerton Station between approximately 4:45 a.m. and 10:30 p.m. with variable headways of about 15 to 90 minutes. On weekends, the Orange County Line stops at Fullerton Station between approximately 9:15 a.m. and 7:00 p.m. with variable headways of about 120 to 130 minutes. CSUF students are eligible to receive discounted fares for the Metrolink (CSUF 2019a).

Amtrak provides rail service through California and other states. The Pacific Surfliner provides service between San Diego and San Luis Obispo, running daily between approximately 4:10 a.m. and 12:10 a.m. The Pacific Surfliner stops at Fullerton Station on weekdays between approximately 6:10 a.m. and 11:10 p.m. with variable headways of about 45 to 125 minutes and stops at Fullerton Station on weekends between approximately 6:35 a.m. and 11:10 p.m. with variable headways of about 45 to 125 minutes.

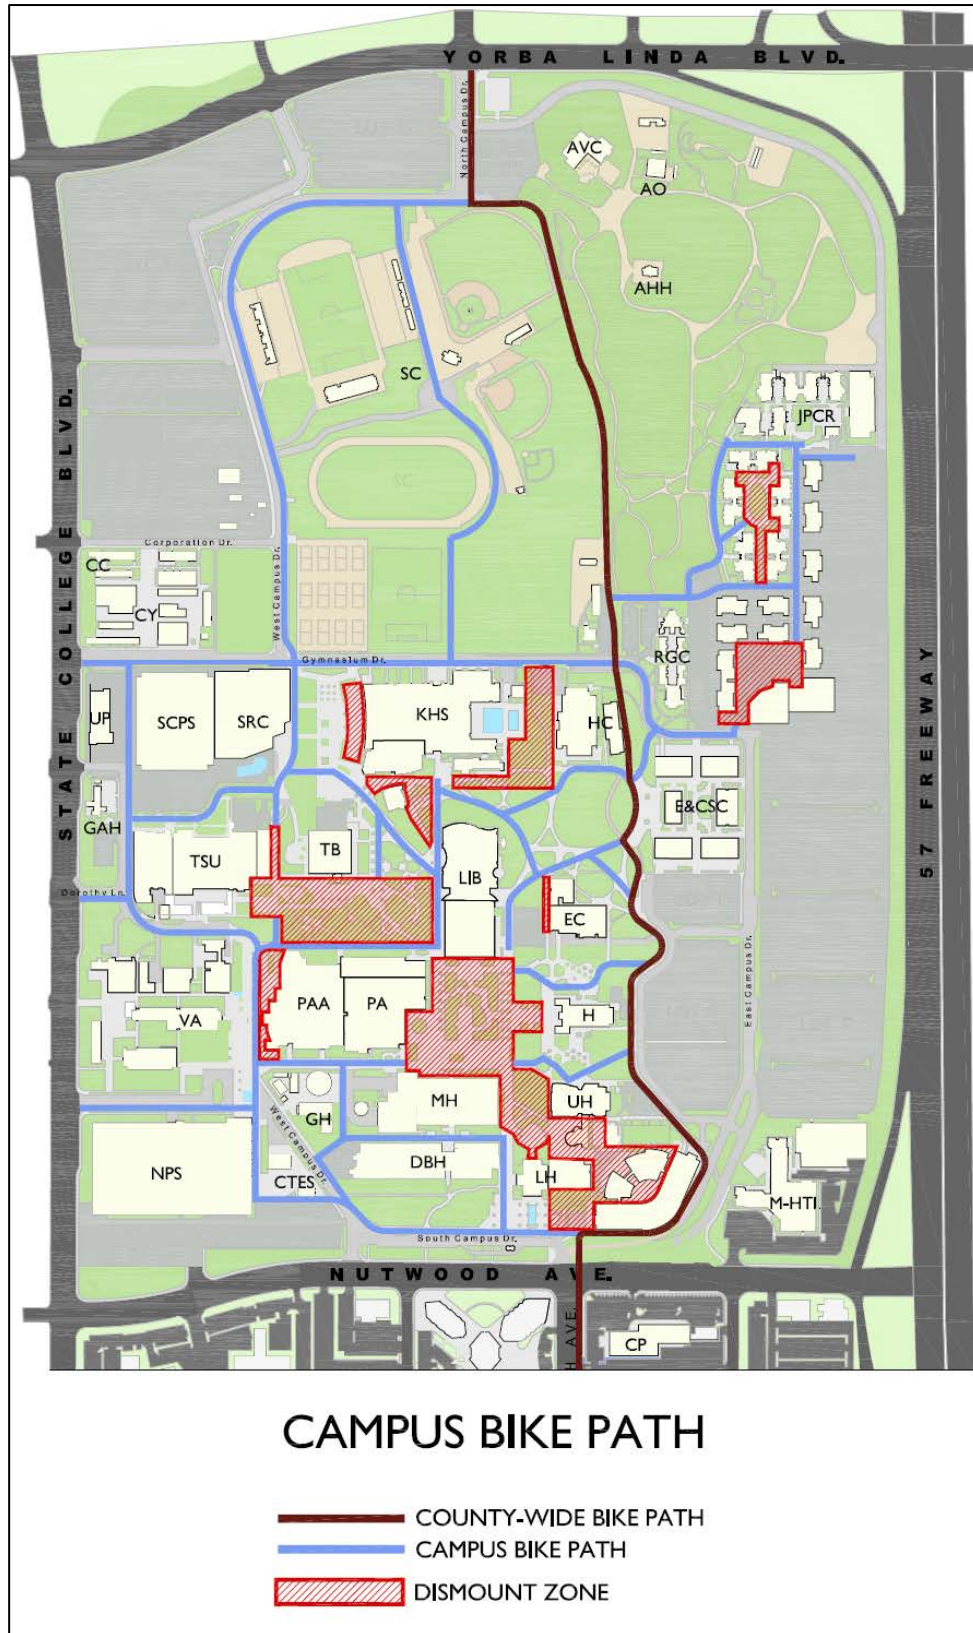

#### **d. Bicycle and Pedestrian Network**

CSUF has an integrated network of bicycle and pedestrian facilities throughout the campus and actively promotes these modes of alternative transportation. Campus-wide programs are in place to support bicycle safety for the CSUF community, such as bicycle safety training programs, free bicycle tune-up events, and on-campus bicycle repair stations (CSUF 2019c). Existing campus bicycle and pedestrian facilities are described below.

#### **BICYCLE INFRASTRUCTURE AND FACILITIES**

A County-wide bicycle path traverses through the CSUF campus, starting from North Campus Drive and running south to Commonwealth Avenue. The campus contains numerous paved bicycle paths that connect students, faculty, and staff to the academic core, recreational facilities, parking areas, the Fullerton Arboretum, and other areas of the CSUF campus. All bicycle paths are shared with pedestrians. Figure 4.11-2 shows existing bicycle paths on the CSUF campus.

Figure 4.11-2 CSUF Bicycle Paths

Source: CSUF 2013

The TIS (Appendix M) provides descriptions of bicycle facility classifications. Existing and proposed bicycle and pedestrian facilities in the vicinity of the CSUF campus are described below based on field observations collected for the TIS, and the City's *Fullerton Bicycle Master Plan* (City of Fullerton 2012a), and the *Fullerton Bike Connection Plan* (2017):

- Existing Class II bike facilities provide connections to the campus area on Associated Road, Dorothy Lane, and Commonwealth Avenue.
- Nutwood Avenue does not have existing bicycle facilities. The *Fullerton Bicycle Master Plan* includes planned Class III facilities are planned on Nutwood Avenue Yorba Linda Boulevard from North State College Boulevard to Placentia Avenue. The *Fullerton Bike Connection Plan* includes Class II bike lanes on Nutwood Avenue between State College Boulevard and Placentia Avenue, with buffers accompanying the bike lanes intermittently as the cross section allows.
- Yorba Linda Boulevard does not have existing bicycle facilities. The *Fullerton Bicycle Master Plan* includes planned Class III facilities are planned on Yorba Linda Boulevard from North State College Boulevard to Associated Road. The *Fullerton Bike Connection Plan* includes Class II bike lanes on both sides of Yorba Linda Boulevard between SR 57 NB ramps and SR 57 SB ramps, and a Class II bike lane on eastbound Yorba Linda Boulevard and a Class III facility on westbound Yorba Linda Boulevard between Campus Drive and Oxford Drive.
- North State College Boulevard does not have existing bicycle facilities and they are not proposed in the future.
- A new bicycle overcrossing is proposed on SR 57; it would provide a Class I path and would connect the campus to Placentia Avenue to provide easier access to the City of Placentia.

Bicycle racks are located throughout the CSUF campus close to academic and student resource buildings, athletic facilities, student housing, and other facilities frequented by students, faculty, and staff. CSUF has campus-wide bicycle storage policies that specify bicycles may only be parked and/or secured in designated bicycle racks, stored in private offices without obstructing entryways, and freight elevators that may be used to move bicycles to higher floors in select buildings (CSUF 2012). Bicycles may not be stored in student housing rooms.

#### e. Pedestrian Circulation

Pedestrian connectivity is important to the CSUF campus for students, faculty, and staff who access school facilities. Once on campus, walking is the primary mode of travel for the CSUF community within the academic core, and within and between school facilities. The pedestrian system consists of a network of walkways that connect parking areas with the academic core, athletic facilities, student services, and the Fullerton Arboretum.

Pedestrian facilities include sidewalks, crosswalks, and pedestrian signals. The three major roads that bound the CSUF campus contain sidewalks on both sides. Pedestrian crosswalks are in place at signalized intersections in the TIS area that lead onto campus sidewalks and walkways.

Within CSUF, on-site circulation is accomplished primarily by foot along key paved pedestrian spines of West Campus Drive (north-south) and Gymnasium Campus Drive (east-west) in the northwest quadrant of campus, which connect to numerous on-campus bicycle paths and walkways in the southern and eastern parts of campus.

## f. CSUF Transportation Demand Management (TDM) Program

CSUF manages a principal TDM program with several sub-measures. Use of the ridesharing and carpooling programs, as well as the aforementioned bicycle, transit, and rail modes, are encouraged by CSUF through the Faculty/Staff Commuter Choice Program which provides various reimbursements and monetary incentives for participants (CSUF 2018). Metrolink and Shuttle services are included in the TDM and are discussed above under *Transit System*.

### *Rideshare and Carshare Programs*

In an effort to provide a more comprehensive commute program for students, faculty, and staff, CSUF incorporates carsharing and ridesharing programs and encourages carpooling and vanpooling.

Zipcar CarShare is a membership-based car rental program providing self-service access to vehicles on campus, 24 hours a day, seven days a week. Zipcar has been made available on campus to students, faculty, and staff since August 2019. The car sharing program allows members to utilize Zipcar vehicles on an hourly or daily basis and is aimed at reducing individual car ownership.

The CSUF campus also has six designated ridesharing drop-off/pick-up zones for Uber and Lyft services. These ridesharing loading zones are conveniently located near CSUF buildings and facilities that are frequented by students, faculty, and staff, such as the on-campus residence halls, along West Campus Drive near the Titan Sports Complex and parking areas, and off Arts Drive near the Clays Performing Arts Center and campus commons to name a few (CSUF 2019a).

### *Commuter Carpool and Vanpool Program*

CSUF facilitates a carpool program to CSUF students, faculty, and staff. A CSUF Titans Carpoolers Group is designated in Waze Carpool<sup>1</sup> to allow participants to easily and efficiently find carpools. Once carpools created, participants can apply for a carpool permit that allows carpools to park in designated on-campus lots (CSUF 2019b). CSUF also offers a vanpool program to faculty and staff, which includes a monthly OCTA subsidy and vehicle reimbursement.

## g. Campus Master Plan Measures

CSUF's site access and vehicular circulation plan is would not change with the updated Campus Master Plan, as discussed in Section 2.5.9, *Project Description*. Current circulation within the campus would remain in its current state, with the exception of expanding bicycle access on existing campus pathways. Yorba Linda Boulevard, North State College Boulevard and Nutwood Avenue would remain the primary arterials and access points around campus. No new access points from these arterials would be constructed as part of the updated Campus Master Plan.

### **TDM Measures**

The Campus Master Plan acknowledges the importance of implementing TDM measures to reduce overall commute times, congestion, VMT, and GHG emissions. The Campus Master Plan has separated TDM measures into three phases; Short Term, Medium Term, and Long Term. All of the TDM measures identified are strategically categorized under certain timetables based on their complexity and necessary funding. The Campus Master Plan TDM measures and their respective phases include:

---

<sup>1</sup> Waze Carpool is an online- and smartphone-based carpool matching program for those who need rides and those who can provide rides. [https://www.waze.com/carpool/referral?a=redeem\\_referral&referral\\_token=tk.28084122-6d58-4e8f-8d5d-6ad32286d5ae](https://www.waze.com/carpool/referral?a=redeem_referral&referral_token=tk.28084122-6d58-4e8f-8d5d-6ad32286d5ae)

### *Short Term*

- First Year Parking Ban
- Dynamic Shared Ride Matching
- Increased Car Share Spaces and Incentives
- Enhanced Guaranteed Ride
- Bike Theft Reduction Program

### *Medium Term*

- Maintain Existing Transit Pass Subsidies
- Fund and Implement Enhanced OCTA Circulator Bus Concept
- Pilot Mobility Hub Concept
- Pilot Closure of Section of Gymnasium Drive
- Improved Multi-modal Wayfinding System
- Expand Bike Benefit to Students
- Variable Parking Pricing

### *Long Term*

- Champion Physical Multi-Modal Improvements Around and To and From Campus with Partner Agencies
- Improve Nutwood Avenue Pedestrian Crossings and Implement Traffic Calming Measures
- Permanent Mobility Hub
- Permanent Pedestrian Street Upgrade to Gymnasium Drive

## 4.11.2 Regulatory Setting

As a state entity, the California State University, of which CSUF is a part, is not subject to regional or local transportation plans and policies of cities or counties or other local jurisdictions. Although CSUF is not subject to local plans of cities and counties, such plans and policies are of interest or concern because it is CSUF policy to seek consistency with regional and local plans and policies, where feasible. Information pertinent to visual resources from the City and County general plans also follows, for informational purposes.

### **Federal**

There are no federal regulations for traffic and circulation that would be applicable to the proposed project or the project area.

### **State**

#### *State Senate Bill 743*

SB 743 was signed into law by Governor Brown in 2013 and tasked the State Office of Planning and Research (OPR) with establishing new criteria for determining the significance of transportation impacts CEQA. SB 743 requires the new criteria to “promote the reduction of greenhouse gas emissions, the development of multimodal transportation networks, and a diversity of land uses.” It

also states that alternative measures of transportation impacts may include “vehicle miles traveled, vehicle miles traveled per capita, automobile trip generation rates, or automobile trips generated.”

On September 27, 2013, California Governor Jerry Brown signed SB 743 into law and started a process that changes transportation impact analysis as part of CEQA compliance. SB 743 requires the Governor’s OPR to identify new metrics for identifying and mitigation transportation impacts within CEQA. In January 2018, OPR transmitted its proposed CEQA Guidelines implementing SB 743 to the California Natural Resources Agency for adoption, and in January 2019 the Natural Resources Agency finalized updates to the CEQA Guidelines, which incorporated SB 743 modifications, and are now in effect SB 743 changed the way that public agencies evaluate the transportation impacts of projects under CEQA, recognizing that roadway congestion, while an inconvenience to drivers, is not itself an environmental impact (Public Resource Code, Section 21099 (b)(2)). In addition to new exemptions for projects consistent with specific plans, the CEQA Guidelines replaced congestion-based metrics, such as auto delay and level of service (LOS), with VMT as the basis for determining significant impacts, unless the CEQA Guidelines provide specific exceptions.

#### *California State University Transportation Impact Study Manual*

The California State University Transportation Impact Study Manual (TISM) provides guidance in the preparation of transportation impact assessments for the projects on CSU campuses, including all lands owned by CSU, consistent with CEQA Guidelines (CSU 2019). The Campus Master Plan TIS (Appendix M) was prepared pursuant to the TISM. Significance criteria specified in the TISM, under which the project is required to be analyzed, are included in Section 4.16.2.1, Thresholds of Significance. The TISM also includes potential mitigation measures to be considered for a project under each impact category, if project impacts are determined to be significant.

#### *California State University Transportation Demand Management Manual*

The California State University Transportation Demand Management (TDM) Manual contains a set of goals, criteria, and best practices to guide the provision of programs, tools, and strategies that encourage students, faculty and staff to commute to and from campus via bus/rail transit, carpools, vanpools, bicycling and walking to lessen reliance upon single-occupant vehicle (SOV) travel and reduce vehicle trips to campuses (CSU 2012). The overall purpose of the manual is to help provide university staff and those creating campus TDM plans, a means to create and implement effective programs.

#### *California State University Administrative Manual (SUAM)*

The California State University Administrative Manual (SUAM) contains policies that establish oversight, guidelines, and procedures for campus development and planning, maintenance, and improvements across the 23 CSU campuses and the Office of the Chancellor (CSU 2018).

The following SUAM policies are applicable to all projects under the Campus Master Plan, and are relevant to potential on-campus circulation realignments:

- **Section X.9203.01(1) – State Fire Marshal (SFM):** All CSU projects are required to be approved by the California State Fire Marshal (Health & Safety Code Section 13108(c)) (Health and Safety Code, Section 13143; Title 19, California Code of Regulations, Section 3.28(b)). Typically, projects require a plan review and approval followed by periodic field inspections and concluding with issuance of a certificate of occupancy or, on renovation/repair works, a field issued notice of

SFM acceptance. At their discretion, on small minor projects, SFM field inspectors may review and issue plan approvals on site in lieu of a submittal to the SFM central office in Monrovia, CA.

- **Section XI.9232(1) – State Fire Marshal (SFM):** University projects are required to be reviewed by the California State Fire Marshal (Health & Safety Code Section 13108(c)) (Health and Safety Code, Section 13143; Title 19, California Code of Regulations, Section 3.28(b)). Typically, a SFM submittal is required. At their discretion, on small minor projects, deputy SFM inspectors may review and issue field plan approvals.

## Local

As previously stated, VMT replaces congestion (i.e., LOS) in the CEQA Guidelines as the metric for determining automobile transportation impacts. Therefore, policies and objectives within local plans (e.g., The Fullerton Plan) pertaining to LOS are not described herein or addressed within this section.

CSUF is an entity of the CSU, which is a constitutionally created state agency, and is therefore not subject to local government planning and land use plans, policies, or regulations. CSUF may consider, for informational purposes, aspects of local plans and policies for the communities surrounding the campus when it is appropriate. The Campus Master Plan would be subject to state agency planning documents described herein but would not be bound by local or regional planning regulations or documents such as The Fullerton Plan or municipal code. However, any improvements to city streets or transportation facilities that are required as part of the Campus Master Plan would be subject to these planning regulations.

### *The Fullerton Plan*

The following goals and policies are included in the City's General Plan, The Fullerton Plan (City of Fullerton 2012b), and would be applicable to the Campus Master Plan:

**Goal 5** A balanced system promoting transportation alternatives that enable mobility and an enhanced quality of life.

**P5.12. Multi-Modal Traffic Analysis.** Support programs, policies, and regulations to analyze and evaluate urban streets using an integrated approach from the points of view of automobile drivers, transit passengers, bicyclists and pedestrians rather than auto-centric thresholds which conflict with other policies of The Fullerton Plan including better environments for walking and bicycling, safer streets, increased transit use, cost-effective infrastructure investments, reduced greenhouse gas emissions, and the preservation of open space.

**P5.14. Fair Share of Improvements.** Support policies and regulations which require new development to pay a fair share of needed transportation improvements based on the project's impacts to the multi-modal transportation network.

**Goal 6** A bicycle-friendly city where bicycling is safe and convenient alternative to motorized transportation and a recreational opportunity for people of all ages and abilities.

**P6.5. Bicycling Safety and Convenience.** Support projects, programs, policies, and regulations that make bicycling safer and more convenient for all types of bicyclists.

**P6.7. Development Projects.** Support projects, programs, policies, and regulations to develop a multi-tiered network of bicycle options that consider traffic volumes, rider experience; and which recognized that all streets should be safe for bicycling.

**P6.12. Bicycle Parking and Facilities.** Support projects, programs, policies, and regulations to provide convenient bicycle parking and other bicycle facilities in existing and potential high demand locations within the City, such as educational institutions, parks, business districts, transit stops, retail, commercial and employment centers.

*Fullerton Bicycle Master Plan*

The Fullerton Bicycle Master Plan (Bicycle Element) was adopted as part of The Fullerton Plan update in 2012. The Bicycle Element is intended to meet the needs and concerns of residents, harmonize bikeway and recreational trail systems for users, and serve as a guide for continued improvements to the City’s bicycle infrastructure. The Bicycle Element notes existing city-wide bicycle facilities and identifies areas where additional bicycle facilities and amenities may be needed to improve the bikeway network and/or user experience. Goal 6 and policies P6.5, P6.7, and P6.12, listed above under the Fullerton Plan, are also included in the Bicycle Element (City of Fullerton 2012a).

### 4.11.3 Impact Analysis

#### a. Thresholds of Significance

To determine whether a project would result in a significant transportation impacts, Appendix G of the CEQA Guidelines and the CSU TISM thresholds (see Table 4.11-2) requires consideration of whether a project would:

1. Conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities;
2. Conflict or be inconsistent with CEQA Guidelines Section 15064.3, would result in a VMT impact as described in Table 14.6.2; subdivision (b);
3. Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment);
4. Result in inadequate emergency access.

**Table 4.11-2 VMT Significance Thresholds**

Impact Categories	CSU Significance Thresholds
Project Level Impacts	Mixed-Use: VMT/Service Population <sup>1</sup> exceeds threshold of 15 percent below existing regional, sub-regional, or citywide VMT/Service Population.
Cumulative Impacts	Mixed-Use: VMT/Service Population <sup>1</sup> under the “with project” condition exceeds the citywide, regional, or sub-regional VMT/Service Population identified under the RTP/SCS condition. <sup>2</sup>

<sup>1</sup> Service population is typically defined as population plus employment. For campuses, service population is defined as population plus employment plus students. The transportation consultant shall not double count resident students twice in this evaluation (i.e., shall not count students that also live on campus) (CSU 2019).

<sup>2</sup> According to the 2016 SCAG RTP/SCS, the plan has a target performance result of reducing VMT by 7.4 percent for the region by 2040 between base year (2012) to the 2040 baseline year, which represents a future in 2040 in which only the following have been implemented: transportation projects currently under construction or undergoing right-of-way acquisition; those transportation programs and projects programmed and committed to in the 2015 Federal Transportation Improvement Program (FTIP); and/or transportation projects that have already received environmental clearance. The plan has a target performance result of reducing VMT by 10.2 percent in the event that all transportation investments and strategies detailed in the 2016 RTP/SCS are fully realized (SCAG 2016).

Source: Fehr & Peers 2019 (Appendix M)

## b. Methodology

The project-specific analysis, herein, is based on the TIS prepared by Fehr & Peers (Appendix M). The updated CEQA Guidelines and SB 743 changed the criteria for determining what constitutes a significant transportation-related environmental impact to rely upon quantification of VMT instead of level of service. CEQA Guidelines Section 15064.3(c) states that the requirement to use the VMT criteria only applies on and after July 1, 2020. A lead agency may elect to apply the criteria in Section 15064.3(b) sooner, and CSU has adopted these criteria as of the date of this report and as included in the TISM.

The project-specific TIS employed a combination of quantitative and qualitative evaluations of the roadway, bicycle, pedestrian, and transit components of the transportation system. All analysis presumes that future background travel conditions remain relatively constant and do not account for potential changes associated with disruptive trends such as increased use of transportation networking companies, which include Uber and Lyft, internet shopping, other internet related activities, automated vehicles, and micro-transit services.

The TIS assumes the Campus Master Plan would be fully implemented by the year 2040, and includes analysis of potential roadway segment forecasts within the project study area and VMT assessments for the following scenarios:

- Baseline (2019) No Project
- Baseline (2019) With Project
- Future Year (2040) No Project
- Future Year (2040) With Project

Table 4.11-3, below, contains the land use inputs associated with each analysis scenario.

**Table 4.11-3 Campus Master Plan Students, Employees, and Housing Growth Forecasts**

Scenario	Students	Employees	Students in University Housing	Students Per Employee	Share of Students Living in University Housing
2019 Baseline No Project	25,000	5,594	2,829	4.46	11.3%
2019 Baseline Plus 2019 Master Plan	32,000	6,594	5,829	4.85	18.2%
2040 Cumulative No Project	25,000	5,594	2,829	4.46	11.3%
2040 Cumulative Plus 2019 Master Plan	32,000	6,594	5,829	4.85	18.2%

Source: Fehr & Peers 2019 (Appendix M)

## Existing Traffic Volumes

The Orange County Regional Travel model (OCTAM) was used to forecast roadway segment volumes and estimate existing and future VMT. The OCTAM was the most appropriate travel model available to calculate VMT because it is the only model that is calibrated to the conditions of Orange County, thus making it the most capable of producing a project level VMT assessment. This model is consistent with the 2016 SCAG RTP/SCS; it has a base year of 2019 and a forecast year of 2040. The Campus Master Plan does not propose any substantive changes to the campus transportation network. Therefore, no changes were made to the baseline or cumulative networks in the TIS model, beyond those programmed in the RTP/SCS.

Despite using the regional traffic model, the City's VMT threshold was used for this analysis. In order to effectively capture the projects effect on overall VMT, a scale must be set that's large enough to capture those effects, but small enough to isolate the project. Thirteen street segments were identified as locations at which to evaluate existing and future traffic operating conditions. A portion of project-related traffic would pass through each of these street segments, and their analysis reveals the expected relative impacts of the Campus Master Plan. Existing daily traffic volumes for the locations evaluated in the TIS (Appendix M) were obtained from a 48-hour roadway segment count collected between September 24 – September 25, 2019. Roadway segment counts were collected on all study segments on a weekday while schools were in session.

The TIS contains the detailed peak hour count sheets for the study segments evaluated. Table 4.11-4 provides a summary of daily traffic volumes for each scenario evaluated in the TIS (Appendix M).

**Table 4.11-4 Daily Traffic Volumes**

<b>Segment</b>	<b>Existing (2019) Count</b>	<b>Existing (2019) Plus Project</b>	<b>Cumulative (2040)</b>	<b>Cumulative (2040) Plus Project</b>
South State College Boulevard from SR 91 to Fender Avenue	22,952	25,030	24,830	25,850
South State College Boulevard from Fender Ave to Nutwood Avenue	24,321	26,640	25,470	26,650
North State College Boulevard from Nutwood Avenue to Yorba Linda Boulevard	30,625	30,870	34,960	34,970
North State College Boulevard from Yorba Linda Boulevard to SR 90	25,097	25,220	27,730	28,100
Nutwood Avenue from South State College Boulevard to SR 57	21,796	25,540	22,130	24,770
Nutwood Avenue/Primrose Avenue from SR 57 to Bradford Avenue	1,494	1,630	3,390	3,400
Yorba Linda Boulevard from North State College Boulevard to Placentia Avenue	38,598	41,890	40,050	41,730
E. Chapman Avenue from North State College Boulevard to SR 57	34,801	34,810	36,850	36,860
E. Chapman Avenue from SR 57 to Bradford Avenue	24,067	24,640	28,030	28,210

Source: Fehr & Peers 2019 (Appendix M)

### Existing Vehicle Miles Traveled

The OCTAM model was used to estimate the existing VMT per service population for the CSUF campus and the City of Fullerton. Students were included in the service population based on guidance provided in the TISM. Students who reside on campus and are included in the Campus and City populations were not counted as both students and residents.

VMT was estimated using the Origin/Destination (OD) method. This was completed by multiplying the OD trip tables and the final assignment skim matrices.<sup>2</sup> The OD tables provided the number of trips between each Traffic Analysis Zone (TAZ), and the skim matrices provided the distance on the roadway network, or trip length, between each TAZ. The full length of all trips with an origin or destination in the TAZ representing the CSUF campus were used to estimate the campus VMT, and likewise the full length of all trips with an origin or destination in any of the TAZs representing the City of Fullerton were used to estimate the City VMT.

As shown in Table 4.11-5, the existing CSUF campus produces a lower VMT per service population (18.72 VMT) than the City of Fullerton (22.24 VMT). This is likely due to the reduction in trip and trip lengths associated with students and faculty who live on the CSUF campus and the CSUF community's use of available transit services used to access the campus.

### c. Issues Not Discussed Further

#### *Level of Service*

In accordance with amendments to the 2018 CEQA Guidelines, VMT is the most appropriate measure of transportation impacts, supplanting vehicular LOS (i.e., delay). Evaluation of LOS is not discussed further.

#### *Emergency Access*

The Campus Master Plan would require that site design is compliant with all applicable emergency access requirements, including Uniform Fire Code Requirements. Therefore, emergency access for future projects under the Campus Master Plan would be subject to review by all appropriate responsible emergency service agencies. All CSU projects are required to follow the SAUM which requires the SFM to review all projects prior to implementation. Thus, future projects under the Campus Master Plan would be designed to meet applicable emergency access and design standards, and adequate emergency access would be provided.

### d. Impact Analysis

<b>Threshold 1:</b> Would the project conflict with a program, plan, ordinance or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?
--

**Impact T-1** DEVELOPMENT UNDER THE CAMPUS MASTER PLAN WOULD BE CONSISTENT WITH APPLICABLE CSU PROGRAMS, PLANS, AND POLICIES. IMPLEMENTATION OF THE CAMPUS MASTER PLAN WOULD NOT RESULT IN MAJOR CHANGES TO THE DESIGN, LOCATION, OR ACCESS TO EXISTING TRANSIT, CAMPUS CIRCULATION, OR BICYCLE AND PEDESTRIAN FACILITIES. IMPACTS WOULD BE LESS THAN SIGNIFICANT. NO MITIGATION MEASURES ARE REQUIRED.

Vehicular access to the CSUF campus would continue to be provided from Yorba Linda Boulevard, North State College Boulevard, and Nutwood Avenue under the Campus Master Plan. Proposed development under the Campus Master Plan would be infill development, consistent with the existing land use context. The Campus Master Plan does not propose any substantive changes to the existing campus transportation network. Implementation of specific projects under the Campus

---

<sup>2</sup> Skim Matrices provide impedances between zones and are used for transportation data analysis. Impedances include travel time, travel distance, and travel costs.

Master Plan may result in updates or minor realignments to existing on-campus circulation and bicycle and pedestrian facilities. However, subsequent realignments and improvements to existing on-campus circulation, included with future Campus Master Plan projects, would adhere to applicable City of Fullerton, CSUF, and CSU systemwide policies and review procedures prior to implementation. Therefore, the Campus Master Plan would not conflict with existing and applicable programs, plans, ordinance, or policies addressing on- and off-campus circulation systems, and the project would have a less than significant impact.

The TIS analyzed project impacts to bicycle and pedestrian facilities, and transit service and facilities (Appendix M). Project impacts are summarized in the following discussion.

### *Bicycle and Pedestrian Facilities*

The potential impact to pedestrian bicycle facilities was evaluated based on whether the Campus Master Plan would physically disrupt an existing facility or interfere with the implementation of a planned facility. In addition, the Campus Master Plan was evaluated to determine if it would create potential conflicts with applicable policies, plans, or programs (Section 4.11.1, *Regulatory Setting*) supporting bicycle use or pedestrian travel such that the conflict could reduce bicycle trips or increase conflicts between pedestrians, bicyclists or other modes.

The Campus Master Plan would implement several measures to help expand and simplify bicycle and pedestrian access through campus. These measures include:

- Increase level of separation between pedestrians and vehicle traffic.
- Preserve and expand the core pedestrian zone in the heart of campus.
- Close a non-critical segment of Gymnasium Drive in the campus core to vehicles to improve walkability and safety.
- Improve the hierarchy of internal circulation, including walkway hierarchy and consistency, and improvement of intuitive design of all paths, including bicycle route.
- Better organize and mark walking paths.
- Prioritize physical improvements to conflict points for vehicles, people walking, and people biking, including Campus Drive and Gymnasium Drive, and the pathway across Gymnasium drive between the academic core and student housing area.
- Clarify overall circulation rules, for where bicycling, skateboarding, and scooters are allowed.
- Improve overall quality of pedestrian and bicycling signage and wayfinding. Create overall wayfinding system that emphasizes walking, biking, and transit.
- Improve the markings, signage, and organization of bicycle routes. Reduce confusion about what travel modes are allowed, and where.
- Where bicycle access terminates to the center of campus, provide bicycle dismount and parking zones – not just “Do Not Enter” signs.
- Formalize and establish a more legible circulation system that prioritizes pedestrian travel across campus – important for identity, placemaking, and mobility.

All measures included in the Campus Master Plan align with the university’s goal as well as the City of Fullerton to help expand bicycle infrastructure throughout campus and the City itself. The City acknowledges in its Bicycle Master Plan that universities such as CSUF have high potential to help increase the City’s overall pedestrian and bicycle ridership. The Campus Master Plan would help

expand bicycle infrastructure both within the campus itself as well as creating connections to other parts of the City and the surrounding region.

Implementation of the Campus Master Plan would generate new bicycle and pedestrian trips commensurate with campus growth among the student, faculty and staff, and on-campus housing. Growth anticipated from the Campus Master Plan entails an increase of approximately 4,000 CSUF commuter students, 3,000 resident students, and 1,000 employees, as modeled in the TIS (Appendix M). Due to the highly walkable nature of the CSUF campus, every additional student, employee, and resident added to the campus population would generate a variety of on-campus pedestrian trips throughout a typical school day (e.g., walking trips to class, meals, social activities, etc.).

The increase in on-campus housing would enable a greater percentage of students to walk to class or work compared to existing conditions. Moreover, increases in transit and vehicle commute trips would generate additional pedestrian trips between campus destinations and on-campus parking and transit facilities, as all transit and vehicle trips begin and end with a pedestrian trip.

Implementation of the Campus Master Plan would not result in any major changes or render inaccessible existing bicycle or pedestrian facilities. Therefore, the project would have a less than significant impact.

#### *Transit Services*

The potential impact to transit service or facilities was evaluated based on whether the Campus Master Plan would physically disrupt an existing facility/service or interfere with the implementation of a planned facility/service. Implementation of the Campus Master Plan would not disrupt service or inhibit access to existing transit services.

Implementation of the Campus Master Plan would generate new transit trips commensurate with campus growth among the student, faculty and staff, and on-campus housing. Proposed development under the Campus Master Plan would not modify existing transit stops or affect transit schedules. The Campus Master Plan proposes three mobility transit hubs at the north, west, and south portions of campus that would allow for transit and shuttle services to access campus more efficiently. The mobility hubs would have designated entry/exit lanes for transit vehicles in order to reduce onboarding and offboarding times and increase overall access to campus. Each mobility hub would be equipped with bicycle locking stations and other amenities for alternative modes of transportation to help encourage overall ridership of transit. Overall transit ridership would increase based on anticipated growth under the Campus Master Plan. However, such ridership increase is encouraged through existing CSUF transportation demand management programs (such as discounted student and faculty/staff passes, increased campus shuttle service, ridesharing, and commuter carpooling and vanpooling). Therefore, the project would have a less than significant impact.

### **Mitigation Measures**

No mitigation required.

### **Significance After Mitigation**

Impacts would be less than significant without mitigation.

**Threshold 2:** Would the project conflict or be inconsistent with CEQA Guidelines Section 15064.3, subdivision (b), such that it would result in project-generated VMT per service population for the campus as a whole that exceeds 18.90 (i.e., 15 percent below citywide VMT per service population [22.24])?

**Impact T-2** PROJECT-GENERATED VMT PER SERVICE POPULATION WOULD BE BELOW THE CSU TSM THRESHOLD. IMPACTS WOULD BE LESS THAN SIGNIFICANT. NO MITIGATION MEASURES ARE REQUIRED.

TDM strategies are often used in conjunction with one another to achieve the highest reduction of VMT. The CAPCOA suggests a variety of measures that have proven to be efficient in reducing overall VMT. These measures include but are not limited to rideshare, subsidized transit passes, vanpool, and shuttles; all of which CSUF would continue to implement. According to CAPCOA, vanpool programs and shuttle programs have a combined VMT reduction of approximately 0.3 percent to 13.4 percent. Additionally, subsidized transit passes have a VMT reduction of approximately 0.3 percent to 20.0 percent along with ridesharing having a VMT reduction of approximately 1.0 percent to 6.2 percent.

To evaluate project VMT impacts, the OCTAM model was modified to include the project under Existing Plus Project and Cumulative Plus Project conditions. The addition of 4,000 commuter students, 3,000 resident students, and 1,000 employees were isolated to assess the project-generated VMT per service population.

The City of Fullerton VMT per service population was calculated for the existing condition using the OCTAM model to establish the citywide threshold. The existing and expanded campus both operate more efficiently with a lower VMT per service population than the existing citywide average. The project-generated VMT per service population from the campus expansion is lower than the existing campus VMT per service population. This is likely due to the VMT efficiency gained from having a higher proportion of students living on campus under Campus Master Plan buildout than compared to existing conditions.

VMT was estimated using the OD method as previously described. The full length of all trips with an origin or destination in the TAZ representing the expansion of the CSUF campus were used to estimate the project generated VMT.

**Table 4.11-5 Existing Plus Project Vehicle Miles Traveled**

Study Area	VMT Per Service Population
City of Fullerton (Existing)	22.24
CSUF Campus (Existing)	18.72
CSUF Campus Expansion (Project) <sup>1</sup>	14.38
CSU TISM Project Level Threshold	18.90
<b>Threshold Exceeded?</b>	<b>No</b>

<sup>1</sup> Campus growth only.

Source: Fehr & Peers 2019 (Appendix M)

As shown in Table 4.11-5, the project-generated VMT per service population would be below the CSU TISM threshold of 15 percent below citywide VMT per service population. Therefore, the project would have a less than significant impact on VMT per service population under the Existing Plus Project scenario.

### Mitigation Measures

No mitigation required.

### Significance After Mitigation

Impacts would be less than significant without mitigation.

**Threshold 3:** Would the project substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?

**Impact T-3** DEVELOPMENT UNDER THE CAMPUS MASTER PLAN WOULD BE CONSTRUCTED IN SUCH A WAY THAT CHANGES WOULD REMAIN CONSISTENT TO SURROUNDING GEOMETRIC DESIGN FEATURES AND ANY REDESIGN OR CONSTRUCTION OF ON-CAMPUS CIRCULATION PATHS WOULD BE DESIGNED AND CONSTRUCTED TO MEET APPLICABLE CAMPUS MASTER PLAN DESIGN STANDARDS. IMPACTS WOULD BE LESS THAN SIGNIFICANT. NO MITIGATION MEASURES ARE REQUIRED.

Vehicular access to the CSUF campus would continue to be provided from Yorba Linda Boulevard, North State College Boulevard, and Nutwood Avenue. The TIS analyzed potential transportation-related hazard impacts based on the inclusion of any specific design components that would create a hazardous condition or change land use relative to the land use context and mix of travel such that the volume, mix, or speed of traffic was not anticipated as part of the original transportation network design (Appendix M).

Proposed development under the Campus Master Plan would be infill development, consistent with the existing land use context. As such, implementation of the Campus Master Plan would generate a mix of traffic similar to existing conditions (primarily commuter traffic from students, faculty, and staff). With more students and employees, the volume of traffic across all modes would increase which may result in slower travel speeds for some modes.

However, these changes would not cause conditions that warranted modification of the existing network as part of the Campus Master Plan. Any new sidewalk or paths would be designed and constructed to applicable Campus Master Plan design standards to minimize hazardous conditions and would undergo project-specific environmental reviewed for project-scale hazards when the project advances through the project development process.

Therefore, implementation of the Campus Master Plan would not substantially increase hazards due to geometric design features or incompatible uses. The project would have a less than significant impact.

## Mitigation Measures

No mitigation required.

## Significance After Mitigation

Impacts would be less than significant without mitigation.

<b>Threshold 4:</b> Would the project result in inadequate emergency access?
--

**Impact T-4** DEVELOPMENT UNDER THE CAMPUS MASTER PLAN WOULD NOT INCLUDE MAJOR CHANGES TO EXISTING ACCESS POINTS OR ON-CAMPUS CIRCULATION PATHS. ALL PROJECTS UNDER THE CAMPUS MASTER PLAN WOULD ADHERE TO CSU POLICY AND UNDERGO REVIEW AND APPROVAL BY THE STATE FIRE MARSHAL PRIOR TO IMPLEMENTATION AND USE. IMPACTS WOULD BE LESS THAN SIGNIFICANT. NO MITIGATION MEASURES ARE REQUIRED.

---

Proposed development under the Campus Master Plan would be infill development, consistent with the existing land use context. The Campus Master Plan does not include major changes to existing access points along Yorba Linda Boulevard, North State College Boulevard, or Nutwood Avenue, nor any major changes to on-campus walkways, bicycle paths, and circulation roads.

Project-level details of planned development are not included in the Campus Master Plan at this time. As discussed above, any new sidewalk or on-campus circulation would be designed and constructed to applicable Campus Master Plan design standards to minimize hazardous conditions and would undergo project-specific environmental reviewed for project-scale hazards when the project advances through the project development process. As part of project-level environmental review, input from emergency services would be solicited to ensure that emergency access meets the standards of service providers.

As stated in Section 4.16.1, *Regulatory Setting*, under SUAM Sections X.9203.01(1) and XI.9232(1), all CSU projects are required to be reviewed and approved by the SFM prior to implementation and issuance of a certificate occupancy and/or notice of SFM acceptance. Potential project impacts on emergency access would be identified and resolved during the SFM's review of project plans. As such, all projects implemented under the Campus Master Plan would undergo SFM review.

Therefore, implementation of the Campus Master Plan would not result in inadequate emergency access to the CSUF campus, and the project would have a less than significant impact.

## Mitigation Measures

No mitigation required.

## **Significance After Mitigation**

Impacts would be less than significant without mitigation.

## 4.12 Utilities and Service Systems

---

This section analyzes the adequacy of existing and planned infrastructure related to water supplies, wastewater conveyance, treatment, and disposal, solid waste disposal, stormwater management, and telecommunications facilities to accommodate the demands and generation associated with implementation of the Campus Master Plan. The discussion and analysis contained herein is informed by outputs from the CalEEMod prepared for the Campus Master Plan, as well as publicly available data and reports from the City of Fullerton, CSUF, Orange County Flood Control District (OCFCD), and Orange County Sanitation District (OCSD).

Impacts related to electricity and natural gas infrastructure and supplies are discussed in greater detail in Section 4.5, *Energy*.

### 4.12.1 Environmental Setting

#### a. Existing Setting

The following section describes the existing setting with respect to water, wastewater, stormwater, solid waste, and telecommunications facilities.

#### Potable Water Supply

The City of Fullerton provides potable water service to residents and businesses in Fullerton. The City of Fullerton Public Works Department is responsible for the water system, including production, conservation, and water quality. The City receives its water from two main sources: 70 percent from local well water from the Coastal Plain of OCGB, which is managed by the OCWD, and 30 percent is comprised of imported water from the Metropolitan Water District of Southern California (MWD) (City of Fullerton 2017). The City has eleven wells located in the southern area of Fullerton, six of which are located at the main plant in Anaheim. The City also has six water connections to imported water from MWD as well as six emergency connections with other utilities.

In the 2015 Urban Water Management Plan (UWMP), the City estimates the population will increase to about 160,545 by 2040, or 14 percent above 2015 levels (City of Fullerton 2017). The City's actual 2015 water demand was 27,244 acre-feet per year (AFY), which is met through locally pumped groundwater and imported MWD water; but this water demand is estimated to increase to 28,891 AFY in 2040 (City of Fullerton 2017). By 2020, the 2015 UWMP projected water demand to be approximately 26,699 AFY with the implementation of water conservation measures.

The City's water supply reliability is determined based upon groundwater resources and from Colorado River and the State Water Project for imported water. Imported water from the Colorado River and State Water Project are currently impacted by climate change and increased demands; resulting in the need for the City to find solutions for years when supplies from imported water are lower than anticipated. The City's groundwater supply from the OCGB is managed by OCWD to protect the long-term sustainability of the OCGB. The City's water supply in 2020 is estimated to be 26,699 AFY and would increase to 28,891 in 2040, matching projected demand (City of Fullerton 2017).

As shown in Table 4.12-1, the City would meet its normal year water demand through 2040 but would have no surplus of supplies. These estimates are based on the City's estimated water supply from groundwater and imported water and demand from the population growth and required

water conservation measures. Table 4.12-2 and Table 4.12-3 shows the projected supply and demand for single dry years and multiple dry years, respectively. The City of Fullerton is projected to meet demands during single and multiple dry year scenarios through 2040, with no surplus of water supplies.

**Table 4.12-1 City of Fullerton Normal Year Supply and Demand Comparison (AFY)**

Sources	2020	2025	2030	2035	2040

Source: City of Fullerton 2017

## Wastewater

Wastewater from CSUF enters into the City’s sewer system. The Sewer Division in the City’s Public Works Department is responsible for the maintenance and rehabilitation of the more than 320 miles of sewer pipe within the City. The sewer system operates entirely by gravity and discharges into several OCSD sewer trunk lines (City of Fullerton 2012).

The OCSD collects, treats, and disposes of, or reclaims, the wastewater generated in Fullerton. OCSD collects wastewater from an approximately 480 square mile area and has 15 outlying pump stations as well as two wastewater treatment plants located in Fountain Valley (Reclamation Plant No. 1) and Huntington Beach (Treatment Plant No. 2). There are two trunk sewers maintained by OCSD that serve the City, and all of the wastewater collected in Fullerton is transported to and treated at OCSD's Treatment Plant No. 2 in Huntington Beach (City of Fullerton 2012). Once treated, wastewater effluent is either discharged through an ocean outfall system or routed to OCWD Groundwater Replenishment System (GWRS) facility, which is adjacent the Reclamation Plant No. 1. OCSD's partnership with OCWD allows for the Sanitation District to produce and provide up to 100 million gallons per day (MGD) of reclaimed water to the GWRS facility (OCSD 2018).

During the 2017/2018 fiscal year, approximately 130 MGD of wastewater was routed to the facilities operated by OCSD (OCSD 2018). Reclamation Plant No. 1 has a primary capacity of 204 MGD of wastewater. Additional treated effluent from Reclamation Plant No. 1 is sent to Treatment Plant No. 2 where it is further treated and disposed of into the ocean (OCSD 2018). Treatment Plant No. 2 has a treatment capacity of 168 MGD, with an average daily treatment of approximately 127 MGD (City of Fullerton 2012).

## Stormwater

The Office of Administration and Finance at CSUF oversees the campus's Storm Water Management Program. The program aims to reduce contamination of soil and groundwater by controlling hazardous materials spills and underground storage tanks. CSUF has been designated as a regulated Municipal Separate Stormwater System (MS4). This is due to the presence of roads with drainage systems, streets and roadways, catch basins, curbs, gutters, man-made channels, and storm drains. Under an MS4 designation, polluted storm water is transported to separate municipal storm sewer systems and discharged into local waterways.

OCFCD maintains stormwater facilities in the vicinity of the campus, including the Fullerton Creek Channel, which flows immediately northwest of the campus, passing under the intersection of Yorba Linda Boulevard and State College Boulevard (OCFCD 2005).

## Solid Waste

Solid waste from CSUF is diverted to the Republic Services transport station in the City of Anaheim. CSUF is serviced by three waste management trucks including a recycling front loader and two landfill trucks. The transport station sorts CSUF's recyclables (aluminum cans, paper, glass, cardboard) from other solid waste that were not previously sorted on campus. In 2017, Republic Services treated approximately 3,000 tons of waste from CSUF, a normal standard for the campus. This amount fluctuates depending on certain variables such as construction. Sorted recyclables are then sold to various companies for reuse and reproduction of products. Recyclables that are not sold are transported to either the Olinda Landfill or Frank R. Bowerman Landfill.

CSUF implements various strategies to divert waste and reduce total waste on campus. Strategies include, but are not limited to, participating in the California Department of Resources Recycling and Recovery (CalRecycle) Buy-Recycled program, providing all buildings on campus with Max-R recycling-and-waste bins, and employing zero waste at special events on campus. The CSU system has set a goal to reach an 80 percent waste diversion by 2020, surpassing the state mandated goal of 75 percent waste diversion (CSU 2014).

## Telecommunications

CSUF's Division of Information Technology provides telecommunications services to the campus and manages telephone, voicemail systems, infrastructure cabling, and campus-issued mobile devices, as well as all telecommunications installations and repairs (CSUF 2019). Additionally, the campus and area are served by a variety of wireless telephone service providers, including AT&T, Sprint, and Verizon.

### 4.12.2 Regulatory Setting

#### Federal

##### *Federal Clean Water Act of 1977*

The federal Water Pollution Control Act was passed in 1972 and was amended in 1977 as the CWA (33 U.S.C. 1251 1376). The CWA was reauthorized in 1981, 1987, and 2000. It establishes the basic structure for regulating discharges of pollutants into the waters of the United States and has given the U.S. Environmental Protection Agency the authority to implement pollution control programs. The CWA requires states to set standards to protect, maintain, and restore water quality through the regulation of point source and certain non-point source discharges to surface waters. Many pollutants are regulated under the CWA, including various toxic pollutants, total suspended solids, biological oxygen demand and pH (acidity/alkalinity measure scale). Those discharges are regulated by the NPDES permit process, described below. The CWA generally applies to surface Waters of the United States, managed by the U.S. Army Corps of Engineers.

#### State

##### *Porter-Cologne Water Quality Control Act*

The Porter-Cologne Water Quality Control Act is the overarching water quality control law for California. It is implemented by the SWRCB and nine RWQCBs. The SWRCB establishes statewide policy for water quality control and provides oversight of the regional boards' operations. The Porter-Cologne Act and the CWA overlap in many ways, as the entities established by the Porter-Cologne Act enforce and implement many federal laws and policies.

##### *Water Conservation Act of 2009*

SB X7-7, which became effective on February 3, 2010, is the water conservation component to the Delta legislative package (SB 1, Delta Governance/Delta Plan). It seeks to implement water use reduction goals established in 2008 to achieve a 20 percent statewide reduction in urban per capita water use by December 31, 2020. The bill requires each urban retail water supplier to develop urban water use targets to help meet the 20 percent goal by 2020 and meet an interim 10 percent goal by 2015.

##### *Senate Bill 610*

SB 610 was signed into law in 2001. This law requires cities and counties to develop water supply assessments (WSAs) when considering approval of applicable development projects in order to determine whether projected water supplies can meet the project's anticipated water demand. Triggers requiring the preparation of a WSA include residential developments of more than 500 dwelling units, shopping centers or business establishments employing more than

1,000 persons or having more than 500,000 square feet of floor space, commercial office buildings employing more than 1,000 persons or having more than 250,000 square feet of floor space, and projects that would demand an amount of water equivalent to, or greater than, the amount of water required by a 500 dwelling unit project. Because the CSU is a State agency and not a city or county, it is not subject to the requirements of Section 19010 of the state Water Code, which implements SB 610, and therefore SB 610 is not applicable to the Campus Master Plan project.

#### *Senate Bill 221*

Whereas SB 610 requires a written assessment of water supply availability, SB 221 requires lead agencies to obtain written verification of sufficient water supply prior to approval of certain specified subdivision projects. For this purpose, water suppliers may rely on an UWMP (if a proposed project is accounted for within the UWMP), a WSA or other acceptable information that constitutes “substantial evidence.” “Sufficient water supply” is defined in SB 221 as the total water supplies available during normal, single-dry and multiple-dry water years within the 20-year (or greater) projection period that are available to meet the projected demand associated with a proposed project, in addition to existing and planned future uses. WSAs are required for residential projects of more than 500 units and hotels of more than 500 rooms. The Campus Master Plan does not meet these criteria and therefore does not require preparation of a WSA pursuant to SB 221.

#### *Water Conservation in Landscaping Act*

The Water Conservation in Landscaping Act, enacted in 2006, required the DWR to update the Model Water Efficient Landscape Ordinance (MWELo). In 2009, the Office of Administrative Law approved the updated MWELo, which required a retail water supplier or a county to adopt the provisions of the MWELo by January 1, 2010, or enact its own provisions equal to or more restrictive than the MWELo provisions. The City of Fullerton has adopted a Landscape Ordinance (Title 15 of the Fullerton Municipal Code) that applies to all new construction and replacement of landscape areas equal or greater than 2,500 square feet in Fullerton. This ordinance would not, however, apply to activities carried out under the Campus Master Plan, because CSUF, as part of the CSU system, is not subject to the City’s Municipal Code.

#### *Green Building Standards Code*

In January 2010, the CBSC adopted the statewide mandatory CalGreen that requires the installation of water-efficient indoor infrastructure for all new projects beginning after January 1, 2011. CalGreen was incorporated as Part 11 into Title 24 of the California Code of Regulations. CalGreen was most recently revised in 2015, with the revisions taking effect for projects approved after December 31, 2015. These revisions include the adoption of former emergency measures for outdoor irrigation and indoor plumbing fixtures applied in 2015 in response to the Governor’s Executive Order B-29-15 in response to extreme drought conditions. CalGreen applies to the planning, design, operation, construction, use and occupancy of every newly constructed building or structure. All new development must satisfy the indoor water use infrastructure standards necessary to meet CalGreen.

CalGreen requires residential and nonresidential water efficiency and conservation measures for new buildings and structures that will reduce the overall potable water use inside the building by 20 percent. The 20 percent water savings can be achieved in one of the following ways:

(1) installation of plumbing fixtures and fittings that meet the 20 percent reduced flow rate specified

in CalGreen, or (2) by demonstrating a 20 percent reduction in water use from the building “water use baseline.”

#### *Urban Water Management Plan Act*

The California Urban Water Management Planning Act applies to municipal water suppliers that serve more than 3,000 customers or provide more than 3,000 AFY of water. The Act requires these water suppliers to update their UWMP every five years to identify short-term and long-term water demand management measures to meet growing water demands during normal, dry and multiple-dry years. The UWMP should include a description of existing and planned water sources, alternative sources, conservation efforts, reliability and vulnerability assessments, and a water shortage contingency analysis.

#### *Phase II Stormwater Discharge Permit (Order Number 2013-0001-DWQ)*

On February 5, 2013, the SWRCB adopted the Waste Discharge Requirements for Stormwater Discharges from Small MS4 General Permit (Order Number 2013-0001-DWQ) (Phase II MS4 Permit). The Phase II MS4 Permit regulates stormwater discharges from small MS4 systems throughout California. CSUF is regulated under the Phase II MS4 Permit as a non-traditional permittee

The Phase II MS4 Permit effectively prohibits non-stormwater discharges to the MS4. Furthermore, the permit requires all regulated projects—which are defined as projects creating and/or replacing 5,000 sf or more of impervious area—to incorporate low impact development (LID) measures, including stormwater retention and treatment features. Stormwater retention and treatment features must be designed to capture runoff from the 85<sup>th</sup> percentile, 24-hour storm event; 80 percent of the annual runoff; or flow from either 0.2 inch per hour rainfall intensity or twice the 85<sup>th</sup> percentile hourly rainfall intensity as determined by local rainfall records.

#### *Integrated Solid Waste Management Act of 1989 (AB 939)*

The California Integrated Waste Management Act (CIWMA) of 1989 created the (former) California Integrated Waste Management Board, now CalRecycle. Responsible for oversight of waste management in California, CalRecycle assists cities, counties, businesses, and organizations with meeting state waste reduction, reuse, and recycling goals. AB 939 requires that local jurisdictions meet waste diversion goals and establish a framework for program implementation, solid waste planning, and solid waste facility and landfill compliance. The CIWMA was primarily intended to encourage minimization of the volume of solid waste disposed of through “transformation” (including incineration, pyrolysis, distillation, and bioconversion) and land disposal through the establishment of solid waste diversion goals for all cities and counties.

#### *AB 341 (Chesbro, 2011)*

AB 341 builds from the goals and requirements of AB 939. It declared a State policy goal of 75 percent diversion of solid waste by the year 2020 and directed CalRecycle to develop and adopt regulations for mandatory commercial recycling.

#### *CalGreen Construction Waste Management Requirements*

CalGreen includes a number of requirements related to solid waste diversion. Importantly, new non-residential construction is required to achieve at least 65 percent construction and demolition waste diversion and provide recycling areas for paper, cardboard, glass, plastics, metal, and organic waste.

## Regional and Local

### *City of Fullerton 2015 Urban Water Management Plan*

The City's 2015 UWMP was prepared in accordance with the California Urban Water Management Planning Act and to implement the Water Conservation Act of 2009. The Plan encourages active planning for future demand and available supplies of water resources, and reports on water conservation strategies to meet the demands.

### *The Fullerton Plan*

The Fullerton Plan, specifically the Natural Environment Element, recognizes the importance of achieving a reliable water supply and integrated waste management. The Fullerton Plan includes the following goals and policies that apply to the Campus Master Plan:

**Goal 7:** Growth and Development aligned with infrastructure capabilities.

**Policy 7.3.** Support projects, programs, policies and regulations to plan for appropriate levels and types of infrastructure based on the desired character of each neighborhood or district.

**Policy 7.5.** Support projects, programs, policies and regulations to ensure that development is appropriate in scale to current and planned infrastructure capabilities.

**Goal 19:** An adequate, safe, and reliable water supply.

**Policy 19.3.** Support projects, programs, policies and regulations to encourage the use of new technologies which reduce water use.

**Policy 19.5.** Support projects, programs, policies and regulations to ensure the quality of the water supply.

**Policy 19.7.** Support projects, programs, policies and regulations to encourage water efficient practices in site and building design for private and public projects.

**Goal 23:** Safe and efficient management of waste.

**Policy 23.3.** Support projects, programs, policies and regulations to promote practices to reduce the amount of waste disposed in landfills.

**Policy 23.6.** Support projects, programs, policies and regulations to evaluate ways to increase recycling and product reuse and reduce waste as part of community-based planning of Focus Areas.

**Policy 23.7.** Support projects, programs, policies and regulations to consider project level solid waste management needs at the site and building design stages.

### *City of Fullerton Municipal Code*

Chapter 5.16 of the City of Fullerton Municipal Code establishes diversion requirements for construction and demolition activities and required applicants to submit a Waste Reduction and Recycling Plan for review and approval in order to reduce the amount of construction waste is disposed of in landfills.

### 4.12.3 Impact Analysis

#### a. Thresholds of Significance

To determine whether a project would result in a significant impact to Utilities and Service Systems, Appendix G of the CEQA Guidelines requires consideration of whether a project would:

- Require or result in the relocation or construction of new or expanded water, wastewater treatment or stormwater drainage, or telecommunications facilities, the construction of which could cause significant environmental effects;
- 1. Not have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple-dry years;
- 2. Result in a determination by the wastewater treatment provider which serves or may serve the project that it does not have adequate capacity to serve the project's projected demand in addition to the provider's existing commitments
- 3. Generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals; or
- 4. Not comply with federal, state, and local management and reduction statutes and regulations related to solid waste
- 5.

#### b. Methodology

Project water demand and solid waste generation were estimated using the CalEEMod run prepared for the Campus Master Plan. CalEEMod estimates project-specific annual water use based on rates derived from statewide water consumption by sector as reported by the Pacific Institute's *Waste Not, Want Not: The Potential for Urban Water Conservation in California* report (CAPCOA 2017). Wastewater generation was obtained from sewer flow calculations prepared in support of the Campus Master Plan. Wastewater generation was based on land use-based generation factors from the City of Los Angeles *Sewerage Facilities Charge Sewage Generation Factor for Residential and Commercial Categories* (Flad Architects 2020). Solid waste generation associated with the Campus Master Plan was estimated based on anticipated demolition debris and operational waste generation as reported in CalEEMod. CalEEMod calculates annual waste generation based on land use-based waste disposal rates reported by CalRecycle (CAPCOA 2017). Other publicly available resources consulted as part of this analysis include the City of Fullerton 2015 UWMP, the OCSD Wastewater Collection and Treatment Facilities Master Plan, the statewide Phase II MS4 Permit, and the CalRecycle Solid Waste Information System (SWIS) database.

### c. Impact Analysis

<b>Threshold:</b> Would the Campus Master Plan require or result in the relocation or construction of new or expanded water, wastewater treatment or stormwater drainage, or telecommunications facilities, the construction of which could cause significant environmental effects?
--

**Impact U-1** THE CAMPUS MASTER PLAN MAY REQUIRE THE RELOCATION OR CONSTRUCTION OF NEW OR EXPANDED WATER INFRASTRUCTURE ON THE CAMPUS. HOWEVER, SUCH RELOCATION AND CONSTRUCTION WOULD NOT CAUSE SIGNIFICANT ENVIRONMENTAL EFFECTS. IMPACTS WOULD BE LESS THAN SIGNIFICANT. NO MITIGATION MEASURES ARE REQUIRED.

---

#### Water

CSUF is served by existing City potable water facilities. The Campus Master Plan may require installation of additional water main lines, lateral connections, and hydrants within the plan area to serve planned facilities. Such facilities would be installed during individual project construction and within the disturbance area of such projects or previously disturbed roadways; therefore, the construction of these infrastructure improvements would not substantially increase disturbance area, associated emissions, or otherwise cause significant environmental effects beyond those identified throughout this document. As described in Impact U-2, below, the Campus Master Plan would be served by existing and planned City supplies, which are not anticipated to require major City treatment or distribution facility improvements. Therefore, impacts with respect to new or expanded water facilities would be less than significant.

#### Mitigation Measures

No mitigation is required.

#### Significance After Mitigation

Impacts would be less than significant without mitigation

**Impact U-2** THE CAMPUS MASTER PLAN MAY REQUIRE THE RELOCATION OR CONSTRUCTION OF NEW OR EXPANDED WATER INFRASTRUCTURE ON THE CAMPUS. HOWEVER, SUCH RELOCATION AND CONSTRUCTION WOULD NOT CAUSE SIGNIFICANT ENVIRONMENTAL EFFECTS. IMPACTS WOULD BE LESS THAN SIGNIFICANT. NO MITIGATION MEASURES ARE REQUIRED.

---

#### Wastewater Treatment

CSUF is served by existing City and OCSD wastewater conveyance facilities, including OCSD trunk sewers within the Yorba Linda Boulevard and North State College Boulevard rights-of-way (ROW); as well as a City sewer main line within the Nutwood Avenue ROW (City of Fullerton 2012). The Campus Master Plan may require installation of additional sewer lines and lateral connections within the plan area to serve planned facilities. As with water facilities, any sewer line extensions necessary to serve the proposed future facilities would generally be installed within the already disturbed ROW of existing roads or within the disturbance footprint of proposed buildings. As such, the construction of these infrastructure improvements would not substantially increase the Campus

Master Plan’s disturbance area, associated emissions, or otherwise cause significant environmental effects beyond those identified throughout this document.

The Campus Master Plan would result in an increase in wastewater generation relative to existing campus conditions. Wastewater generated at the campus would be treated at the OCSD Treatment Plant No. 2 in Huntington Beach. According to sewer flow calculations prepared in support of the Campus Master Plan, existing facilities to be replaced under the Campus Master Plan currently generate an average wastewater flow of approximately 82,860 gallons per day (GPD) (0.08 MGD), or a peak flow of 207,150 GPD (0.21 MGD). New facilities constructed under the Campus Master Plan would generate an average wastewater flow of approximately 573,749 GPD (0.57 MGD), or a peak flow of approximately 1,434,373 GPD (1.43 MGD). Therefore, the Campus Master Plan would result in a net increase in average wastewater flow of approximately 490,889 GPD (0.49 MGD) and peak flow of approximately 1,227,223 (1.23 MGD). Table 4.12-4 summarizes the available capacity at the OCSD Treatment Plant No. 2 and the percentage used by anticipated project wastewater generation based on both average and peak daily flow conditions.

**Table 4.12-4 Wastewater Treatment Plant Capacity**

Orange County Sanitation District Treatment Plant No. 2	
Average Daily Treatment	127 MGD
Capacity	168 MGD
Available Capacity	41 MGD
Project Net Wastewater Generation - Average Flow (Peak Flow)	0.49 MGD (1.23 MGD)
Percent of Available Capacity Used by Project – Average Flow (Peak Flow)	1.2% (3.0%)
MGD = million gallons per day Note: Peak flow is determined for sewer infrastructure design purposes by multiplying the design flow by a peaking factor. Sewer flow calculations prepared for the project employed a peaking factor of 2.5. Peak flow conditions are anticipated to result from wet weather and inflow/infiltration to the sewer system and are analyzed in this EIR to provide a conservative analysis. Sources: City of Fullerton 2012; Flad Architects 2020	

As shown in Table 4.12-4, wastewater treatment facilities serving the Campus Master Plan have sufficient capacity to process the additional wastewater generated by the Campus Master Plan under both average and peak daily flow conditions. Furthermore, total influent<sup>1</sup> flow to OCSD facilities has declined steadily since 2005, with influent flows dropping approximately 20 percent between 2005 and 2016 (OCSD 2017). Consequently, OCSD does not consider capacity a driving factor in its capital improvement program. The Campus Master Plan would be responsible for constructing on-site wastewater treatment conveyance systems and paying standard sewer connection fees, as necessary. Consequently, impacts with respect to wastewater treatment facilities would be less than significant.

<sup>1</sup> Influent (adjective) – flowing in. Influent (noun) – a stream, especially a tributary, which flows into another stream or lake.

## Mitigation Measures

No mitigation is required.

## Significance After Mitigation

Impacts would be less than significant without mitigation

**Impact U-3** THE CAMPUS MASTER PLAN MAY REQUIRE THE RELOCATION OR CONSTRUCTION OF NEW OR EXPANDED STORMWATER MANAGEMENT ON THE CAMPUS. HOWEVER, SUCH RELOCATION AND CONSTRUCTION WOULD NOT CAUSE SIGNIFICANT ENVIRONMENTAL EFFECTS. IMPACTS WOULD BE LESS THAN SIGNIFICANT. NO MITIGATION MEASURES ARE REQUIRED.

---

## Stormwater Management

As described in Section 4.12.1, *Setting*, CSUF is regulated under the Phase II MS4 Permit, which requires all regulated projects—defined as projects creating and/or replacing 5,000 sf or more of impervious area—to incorporate LID measures, including stormwater retention and treatment features. Such stormwater retention features must capture runoff from the 85<sup>th</sup> percentile, 24-hour storm event; 80 percent of the annual runoff; or flow from either 0.2 inch per hour rainfall intensity or twice the 85<sup>th</sup> percentile hourly rainfall intensity as determined by local rainfall records. Potential retention features that may be incorporated into individual project designs include detention basins, biofiltration/catchment basins, or constructed wetland features. Given the size of proposed facilities, it is anticipated that all individual projects constructed under the Campus Master Plan would constitute regulated projects under the Phase II MS4 Permit and, therefore, would be required to demonstrate compliance with the stormwater capture requirements described in the permit.

As with water and wastewater facilities, proposed storm drain infrastructure would be constructed within the disturbance area of individual projects or previously disturbed roadways and would not result in substantial additional environmental impacts. Given that individual projects would capture and retain on-site runoff in compliance with the Phase II MS4 Permit, off-site improvements to the storm drain network would not be anticipated. As such, impacts related to new or expanded stormwater facilities would be less than significant.

## Mitigation Measures

No mitigation is required.

## Significance After Mitigation

Impacts would be less than significant without mitigation

**Impact U-4** THE CAMPUS MASTER PLAN MAY REQUIRE THE RELOCATION OR CONSTRUCTION OF NEW OR EXPANDED TELECOMMUNICATION ON THE CAMPUS. HOWEVER, SUCH RELOCATION AND CONSTRUCTION WOULD NOT CAUSE SIGNIFICANT ENVIRONMENTAL EFFECTS. IMPACTS WOULD BE LESS THAN SIGNIFICANT. NO MITIGATION MEASURES ARE REQUIRED.

---

### Telecommunications

No major telecommunications improvements are proposed as part of the Campus Master Plan. Individual projects occurring under the Campus Master Plan may require minor telecommunications improvements, such as undergrounding of telephone lines or rewiring of buildings during renovation. Such improvements would be minor in nature and would generally occur within the disturbance area of individual projects. Consequently, impacts would be less than significant.

### Mitigation Measures

No mitigation measures are required.

### Significance After Mitigation

Impacts would be less than significant without mitigation.

**Threshold:** Would the Campus Master Plan have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years?

**Impact U-5** CONSTRUCTION AND OPERATION OF THE CAMPUS MASTER PLAN WOULD RESULT IN A NET INCREASE IN WATER DEMAND OF APPROXIMATELY 1,198 AFY OF WATER. THIS INCREASE IN DEMAND THROUGH 2040 IS ACCOUNTED FOR IN THE CITY OF FULLERTON'S 2015 URBAN WATER MANAGEMENT PLAN. IMPACTS WOULD BE LESS THAN SIGNIFICANT. NO MITIGATION MEASURES ARE REQUIRED.

---

The Campus Master Plan would generate both construction-related and operational water demand. Discussions of both sources of water demand follow.

### Construction Demand

Water would be required for temporary construction activities on the campus, including dust suppression, grading and grubbing, compaction, construction equipment wheel washing, and concrete mixing and casting. Water consumption by construction workers and cleaning of portable toilets on the campus may also account for a small portion of overall construction water demand.

Watering for dust suppression would demand the most water during construction. Pursuant to the requirements of SCAQMD Rule 403 as described in Section 4.2, *Air Quality*, all disturbed unpaved roads and disturbed areas within the campus would be watered to reduce fugitive dust generation from construction activities. Demolition, site preparation, and grading are the activities anticipated to result in the greatest dust generation and, therefore, the greatest construction-related water demand. Water demand for dust suppression is highly dependent on a number of site-specific variables, including soil properties, antecedent moisture conditions, and other climatic factors. A 2017 analysis prepared by SCAQMD estimated water demand associated with Rule 403 dust suppression requirements for construction sites in SCAQMD jurisdiction at approximately

1,000 gallons per acre per day (SCAQMD 2017). According to the construction schedule used in the CalEEMod run prepared for the Campus Master Plan, demolition, site preparation, and grading activities would occur anywhere from 310 days during Phase 2 and Phase 3 to 630 days during Phase 1. The disturbance area requiring watering for dust control would vary depending on the nature of projects and the number of projects occurring simultaneously. According to the Campus Master Plan the largest single component, Student Housing Cluster 2, has a footprint of approximately 130,000 square feet, or approximately three acres. Therefore, it was conservatively assumed up to five acres of land may require site watering over the course of demolition, site preparation, and grading activities for any given development phase.

Table 4.12-5 shows estimated construction water demand associated with each phase of development.

**Table 4.12-5 Anticipated Construction Water Demand**

Construction Phase	Duration of Demolition, Site Preparation, and Grading Activities <sup>1</sup>	Projected Construction Water Demand (gallons) <sup>2</sup>	Projected Construction Water Demand (AF)
Phase 1	630 days	3,150,000	9.7
Phase 2	310 days	1,550,000	4.8
Phase 3	310 days	1,550,000	4.8
<b>Total</b>	<b>1,250 days</b>	<b>6,250,000</b>	<b>19.2</b>

<sup>1</sup>Based on demolition, site preparation, and grading activity duration in construction schedule provided by CalEEMod run.

<sup>2</sup>Assumes up to five acres requiring site watering during any given day and a 1,000 gallon per acre per day watering rate (SCAQMD 2017).

Source: CalEEMod outputs (Appendix C), SCAQMD 2017

AF = acre-feet

Note: Totals may not sum precisely due to rounding.

Construction water demand would account for approximately 19.2 AF over the approximately 16-year buildout period, or approximately 1.2 AFY. Construction water demand would be temporary and, therefore, would not result in a long-term strain on water supplies. Given the temporary and minimal nature of construction water demand, impacts related to construction water consumption would be less than significant.

## Operational Demand

The Campus Master Plan would replace and renovate various CSUF facilities and would increase student and faculty housing and associated amenities on the campus. Table 4.12-6 summarizes the projected water demand of the Campus Master Plan based on land use-based demand factors provided by CalEEMod. This analysis conservatively assumes all project-generated demand would be new water demand and does not account for water demand associated with existing facilities to be replaced. The analysis is conservative since, in the absence of a water use rate for on-campus student housing, the City's water demand factor for apartments was applied to calculate water demand; however, student housing uses less water per capita than apartments because they do not include individual kitchens and share bathrooms and laundry facilities.

**Table 4.12-6 Estimated Project Water Demand**

Land Use Type	Indoor Water Demand (Million Gallons per Year)	Outdoor Water Demand (Million Gallons per Year)	Total Water Demand (Million Gallons per Year)	Total Water Demand (AFY)
Apartments (Mid-Rise)	143.3	113.0	256.3	786.5
Arena <sup>1</sup>	87.6	7.0	94.6	290.2
Regional Shopping Center	2.4	1.8	4.2	12.8
University/College	12.0	23.4	35.4	108.7
<b>Total</b>	<b>245.3</b>	<b>145.2</b>	<b>390.5</b>	<b>1,198.3</b>

<sup>1</sup> Arena land use is a proxy for the proposed Event Center.

GPD = gallons per day, AFY = acre-feet per year, sf = square feet

Note: Totals may not sum precisely due to rounding.

Source: CalEEMod outputs (Appendix C)

Indoor water use would account for approximately 62.8 percent of the Campus Master Plan’s total water demand, with the majority of indoor water use associated with the student and faculty housing. Outdoor water use would account for approximately 37.1 percent of the Campus Master Plan’s total water demand and would include water used for landscape irrigation and water features. These conservative estimations would be reduced through the inclusion of State mandated water conservation measures. For example, the Campus Master Plan would comply with all requirements of CalGreen pertaining to maximum flow rates for plumbing fixtures, such as toilets, showerheads, and faucets in both residential and non-residential buildings. Furthermore, per the CSU Sustainability Policy, adopted in 2014 by the CSU Board of Trustees, all CSU campuses are to develop sustainable landscaping, install controls to optimize irrigation water use, and cooperate with state, city, and county governments to reduce water use during drought declarations (CSU 2014). Compliance with CalGreen and the CSU Sustainability Policy, and continued water conservation efforts already in place at CSUF, would further decrease the indoor and outdoor water demand beyond the rates presented in Table 4.12-6.

### *Water Supply Availability*

As discussed in Section 4.18.1, *Setting*, the City of Fullerton estimates water supply availability for normal, single-dry, and multiple-dry year scenarios from 2020 through 2040 in its 2015 UWMP. For all years and all scenarios, the City anticipates meeting projected demand, but does not anticipate any excess supply. Therefore, the analysis of water supply availability focuses on whether or not the Campus Master Plan is consistent with the water demand projections contained in the City’s 2015 UWMP.

The majority of the Campus Master Plan’s anticipated increase in water demand is attributable to proposed student and faculty housing. The Event Center, university/college, and retail land uses would amount to approximately 412 AFY.

The City’s 2015 UWMP projects future residential water demand from 2020 through 2040, which corresponds to the approximate buildout timeframe of the Campus Master Plan. Table 4.12-7

summarizes the Campus Master Plan components’ share of the increase in demand for the applicable land use types as reported in the City’s 2015 UWMP. Water demand associated with the Campus Master Plan’s housing components were compared to the 2015 UWMP’s anticipated increase in total residential demand, while water demand associated with the arena (event center), university/college, and retail land uses was compared to the 2015 UWMP’s anticipated increase in commercial and institutional/governmental demand.

**Table 4.12-7 Project Share of Fullerton Projected Demand Increase by Use Type**

Project Component	2020 Projected Demand in Use Type	2040 Projected Demand in Use Type	Projected Increase	Project Demand	Project’s Share of Projected Increase (%)
Apartments (Mid-Rise)	15,743 <sup>1</sup>	17,035 <sup>1</sup>	1,292	786.5 <sup>2</sup>	60.9
Arena <sup>3</sup> , University/College, Retail	5,586 <sup>4</sup>	6,045 <sup>4</sup>	459	411.7 <sup>5</sup>	89.7

<sup>1</sup> Based on total residential use type demand, as shown in Table 2-8 of the 2015 UWMP (City of Fullerton 2017).

<sup>2</sup> Demand obtained from CalEEMod, as presented in Table 4.12-6.

<sup>3</sup> Arena land use is a proxy for the Event Center.

<sup>4</sup> Based on commercial and institutional/governmental use type demand, as shown in Table 2-4 of the 2015 UWMP (City of Fullerton 2017).

<sup>5</sup> Demand obtained from CalEEMod, as presented in Table 4.12-6.

Units in acre-feet per year (AFY).

Source: City of Fullerton 2017, CalEEMod outputs (Appendix C)

As shown in Table 4.12-7, the Campus Master Plan’s anticipated demand would be within the projected 2020 to 2040 demand increases assumed in the City’s 2015 UWMP. The campus is located in a portion of the City of Fullerton served by both imported water from MWD and local groundwater (City of Fullerton n.d.). Based on the water supply projections contained in the City’s 2015 UWMP, the City anticipates purchasing up to 8,667 AFY from MWD to meet demand through 2040 (City of Fullerton 2017, Table 3-4). Based on the Tier 1 limits described in MWD’s 2015 UWMP, the City would have an additional 2,632 AFY available from MWD to serve both the Campus Master Plan and reasonably foreseeable future development during normal, single-dry, and multiple-dry year scenarios. MWD anticipates sufficient supplies to meet expected demand under normal, single-dry, and multiple-dry year conditions through 2040 (MWD 2016).

As described above, the Campus Master Plan’s projected gross increase in water demand would be within the anticipated increase in water demand through 2040 accounted for in the City’s 2015 UWMP. Additionally, this analysis of Master Plan demand is highly conservative, in that it applies the City’s apartment water demand factor to on-campus student housing and the City’s commercial and arena demand factors to on-campus commercial and event center uses, respectively; assumes all water demand generated by the Campus Master Plan would be net new demand and does not account for existing water use at CSUF facilities that would be replaced; and does not factor in State and CSU mandated water conservation policies that would further reduce net demand.

## Mitigation Measures

No mitigation measures are required.

## Significance After Mitigation

Impacts would be less than significant without mitigation.

**Threshold:** Would the project result in a determination by the wastewater treatment provider which serves or may serve the project that it does not have adequate capacity to serve the project projected demand in addition to the provider's existing commitments?

**Impact U-6** WASTEWATER GENERATED BY DEVELOPMENT UNDER THE CAMPUS MASTER PLAN WOULD BE TREATED AT THE ORANGE COUNTY SANITATION DISTRICT'S TREATMENT PLANT NO. 2 FACILITY IN HUNTINGTON BEACH. THE PLANT WOULD HAVE ADEQUATE CAPACITY TO SERVE THE CAMPUS MASTER PLAN'S ANTICIPATED WASTEWATER GENERATION IN ADDITION TO ITS EXISTING WASTEWATER TREATMENT COMMITMENTS. IMPACTS WOULD BE LESS THAN SIGNIFICANT. NO MITIGATION MEASURES ARE REQUIRED.

As discussed under Impact U-1, project-generated wastewater would be adequately served by available capacity at the OCS D Treatment Plant No. 2 facility in Huntington Beach. Wastewater generated by the development under the Campus Master Plan would account for approximately 2.2 percent of the remaining available capacity at the plant, which has approximately 41 MGD of excess treatment capacity. As such, the Campus Master Plan would not result in a determination by the wastewater treatment provider that it does not have adequate capacity to serve the Campus Master Plan's anticipated demand in addition to the provider's existing commitments. Impacts would be less than significant.

### Mitigation Measures

No mitigation measures are required.

### Significance After Mitigation

Impacts would be less than significant without mitigation.

**Threshold:** Would the project generate solid waste in excess of state or local standards, or in excess of the capacity of local infrastructure, or otherwise impair the attainment of solid waste reduction goals?

**Threshold:** Would the project fail to comply with federal, state, and local management and reduction statutes and regulations related to solid waste?

**Impact U-7** THE CAMPUS MASTER PLAN WOULD NOT GENERATE SOLID WASTE IN EXCESS OF STATE OR LOCAL STANDARDS, OR IN EXCESS OF THE CAPACITY OF LOCAL INFRASTRUCTURE, INCLUDING THE FRANK R. BOWERMAN LANDFILL. THE CAMPUS MASTER PLAN WOULD NOT IMPAIR THE ATTAINMENT OF SOLID WASTE REDUCTION GOALS AND WOULD COMPLY WITH FEDERAL, STATE, AND APPLICABLE LOCAL STATUTES AND REGULATIONS RELATED TO SOLID WASTE. IMPACTS WOULD BE LESS THAN SIGNIFICANT. NO MITIGATION MEASURES ARE REQUIRED.

As described in Section 4.13.1, *Setting*, solid waste generated on the campus is collected and transported to the Republic Services transport station in Anaheim, and ultimately disposed of at either the Olinda Landfill in Brea or the Frank R. Bowerman Landfill in Irvine. Both landfills accept mixed municipal, industrial, and construction/demolition waste; the Olinda Landfill also accepts agricultural, tires, and wood waste (CalRecycle 2019a, 2019b).

While the Olinda Landfill is located closest to the campus, it has an anticipated ceased operations date of approximately December 31, 2021. Therefore, it is anticipated that the majority of waste

generated by the Campus Master Plan would be disposed of at the Frank R. Bowerman Landfill. The Frank R. Bowerman Landfill is located approximately 15 miles southeast of the campus at 11002 Bee Canyon Access Road in Irvine. According to the CalRecycle SWIS database, the Frank R. Bowerman Landfill has a maximum permitted capacity of 266,000,000 cy and a maximum daily throughput of 11,500 tons per day (CalRecycle 2019b). The landfill has an anticipated closure date of 2053.

## Construction

Demolition of existing facilities and soil export would result in the generation of construction/demolition debris that would need to be disposed of at area landfills. Approximately 714,055 square feet of existing building area would be demolished and replaced over the course of the buildout of the Campus Master Plan, according to modeling assumptions used in CalEEMod. CalEEMod, which was used to determine emissions from all project construction activities including demolition, employs a conversion factor of 0.046 tons per square foot for building demolition debris, based on an analysis of commercial brick, concrete, and steel building demolition (CAPCOA 2017). Using the same conversion factor, demolition would generate approximately 32,847 tons of debris for off-site disposal, or approximately 82 tons per day when spread over the estimated 400 days of demolition activities anticipated across all construction phases, as estimated in CalEEMod. Consequently, demolition debris would account for approximately 0.7 percent of the permitted daily throughput at the Frank R. Bowerman Landfill during the 400 days of demolition activities. Hence, the facility would have adequate capacity to serve this phase of project construction.

Because the campus consists of a largely developed campus, grading for individual projects developed under the Campus Master Plan is not anticipated to result in major export of soil. Nevertheless, grading activities may result in export of some soil from individual project construction sites. As described above, both the Olinda Landfill and Frank R. Bowerman Landfill accept construction/demolition waste. Grading activities associated with the Campus Master Plan would not occur all at once, but rather would be spread across multiple projects implemented over the life of the Campus Master Plan. Furthermore, exported soil could be transported to other area landfills that accept soil and construction debris in nearby San Bernardino, Los Angeles, and Riverside counties to further reduce impacts at any single solid waste disposal facility, or used beneficially as landfill cover or imported fill material at other construction sites. Therefore, disposal of soils from grading of the campus would not exceed the capacity of local solid waste disposal facilities.

The handling of all debris and waste generated during construction of the Campus Master Plan would be subject to 2016 CalGreen requirements and the California Integrated Waste Management Act of 1989 (AB 939) requirements for salvaging, recycling, and reuse of materials from construction activity on the campus. Therefore, impacts related to solid waste generated during construction would be less than significant.

## Operation

According to CalEEMod outputs, at buildout, implementation of the Campus Master Plan would generate a net increase of approximately 2,591.5 tons of solid waste annually, or approximately 7.1 tons per day. Based on this information, the Campus Master Plan's anticipated solid waste generation would account for less than 0.1 percent of the Frank R. Bowerman Landfill's daily permitted throughput of 11,500 tons per day. Given this small proportion of permitted throughput, the solid waste generated by operation of the Campus Master Plan would be adequately accommodated by existing landfills.

For operational waste, AB 939 requires all cities and counties to divert a minimum of 50 percent of all solid waste from landfills. The Campus Master Plan would be required to comply with federal, state, and CSU statutes and regulations related to solid waste. Therefore, because the Campus Master Plan would be served by landfills with sufficient capacity and would comply with applicable regulations related to solid waste, impacts would be less than significant.

### **Mitigation Measures**

No mitigation measures are required.

### **Significance After Mitigation**

Impacts would be less than significant without mitigation.

## 4.13 Effects Found Not to be Significant

---

Section 15128 of the CEQA Guidelines requires an EIR to briefly describe any possible effects that were determined not to be significant and were therefore not discussed in detail. This section addresses the potential environmental effects of the Campus Master Plan that were determined not to be significant. The topics listed below that were found not to be significantly affected by the Campus Master Plan are drawn from the environmental checklist form included in Appendix G of the CEQA Guidelines. Any items not addressed in this section are included in Sections 4.1 through 4.12 of this EIR.

### 4.13.1 Agriculture and Forestry Resources

The CEQA Guidelines Appendix G states that a significant impact on agricultural and forestry resources may result if the project would:

- a. *Convert Prime Farmland, Unique Farmland, or Farmland of Statewide Importance (Farmland), as shown on maps prepared pursuant to the Farmland Mapping and Monitoring Program of the California Resources Agency, to non-agricultural use;*
- b. *Conflict with existing zoning for agricultural use or a Williamson Act contract;*
- c. *Conflict with existing zoning for, or cause rezoning of, forest land (as defined in Public Resources Code Section 12220(g)); timberland (as defined by Public Resources Code Section 4526); or timberland zoned Timberland Production (as defined by Government Code Section 51104(g));*
- d. *Result in the loss of forest land or conversion of forest land to non-forest use;*
- e. *Involve other changes in the existing environment which, due to their location or nature, could result in conversion of Farmland to non-agricultural use or conversion of forest land to non-forest use.*

The CSUF campus which has a land use designation of School (S) as shown on Exhibit 2, *Community Development Plan*, in the Fullerton Plan Community Development and Design Element (City of Fullerton 2012). The campus does not contain Farmland, Unique Farmland, or Farmland of Statewide Importance and there are no active Williamson Act contracts associated with the campus (California Department of Conservation [DOC] 2016). There would be no impact with regard to conversion of farmland or conflicts with existing zoning or Williamson Act contracts.

According to the Orange County Important Farmlands 2016 map, the campus and immediate vicinity are designated as Urban and Built-Up Land (DOC 2016). The Arboretum located in the northeast corner of the campus contains several plant collections. However, the Fullerton Arboretum does not meet the definition of forest land or timberland under PRC Sections 12220(g) or 4526, or Government Code Section 51104(g). Therefore, implementation of the Campus Master Plan would not lead to the loss or conversion of farmland, forest land, or timberland, and would not produce changes in the existing environment which, due to their location or nature, could result in conversion of farmland to non-agricultural use or conversion of forest land to non-forest use. No impacts associated with farmland, forest land, or timberland would occur.

### 4.13.2 Biological Resources

A Biological Resources Assessment Memorandum (BRAM) was completed for the Campus Master Plan by Rincon Consultants, Inc., dated August 2019, and is included as Appendix N to this EIR. The analysis included in the BRAM is based on a literature review of the following: California Department of Fish and Wildlife (CDFW) California Natural Diversity Database (CNDDDB); California Native Plant Society (CNPS) Online Inventory of Rare and Endangered Plants; U.S. Fish and Wildlife (USFWS) Critical Habitat Portal; USFWS Information, Planning, and Conservation System; USFWS National Wetland Inventory (NWI) Mapper; and the Natural Resources Conservation Service (NRCS) Web Soil Survey. The database review was confirmed with a field reconnaissance survey completed on July 15, 2019. The discussion herein is based on the findings presented in the BRAM (Appendix N).

The CEQA Guidelines Appendix G states that a significant impact on biological resources may result if the project would:

- a. *Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special status species in local or regional plans, policies, or regulations, or by the California Department of Fish and Game or U.S. Fish and Wildlife Service;*
- b. *Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the California Department of Fish and Game or US Fish and Wildlife Service;*
- c. *Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means.*

The CNDDDB/CNPS query results included nine special-status plant species and 18 special-status wildlife species within five miles of the campus. No natural native habitat exists within the campus that would support these plant or wildlife species; the only habitat present in the campus is landscaped and developed (Appendix O). Furthermore, no special-status plant or wildlife species were observed during the field reconnaissance survey. The campus is fully developed and supports educational institution uses, and the same uses would continue under the Campus Master Plan. Therefore, the Campus Master Plan would have no impact on any candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by CDFW or USFWS.

Two ponds are located in the Fullerton Arboretum, which were confirmed to be artificial, with contained circulated water, and no connections to any other water features. The nearest natural feature is Fullerton Creek, located approximately 80 feet from the northwest corner of the campus under the intersection of East Yorba Linda Boulevard and North State College Boulevard. Impacts associated with the Campus Master Plan would be approximately 625 feet from the southern pond. Given the distance, the Campus Master Plan would have no impact on native riparian habitat or sensitive vegetation communities.

- d. *Interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites.*

The campus is surrounded by developed industrial and residential properties and established transportation corridors. CSUF is located adjacent to the Fullerton Creek, which is not designated as

an Essential Connectivity Area or Natural Landscape block (Appendix N). The campus has limited value or benefit to wildlife movement in the region given that it is bounded by urban and residential developments. The San Gabriel Mountains, located approximately 18 miles north of the CSUF campus, serves as the closest essential wildlife corridor connectivity area. A natural landscape block is located approximately three miles northeast of the campus in Chino Hills. Given the distance to these two areas, the campus does not serve as a migratory wildlife corridor and implementation of the Campus Master Plan would not substantially interfere with the movement of any native wildlife species. Therefore, the Campus Master Plan would have no impact on the movement of native or migratory fish or wildlife species.

*e. Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance.*

The Campus Master Plan includes design frameworks that specify tree plantings throughout campus, such as in the Green Loop where trees would be planted with a 15-foot setback from the centerline of the path, and campus axes where trees would be planted 12- to 15-feet from the centerline of the path. The Campus Master Plan states that a mature tree canopy would be maintained along the perimeter of campus to maintain a clear boundary between campus and neighboring residential areas and SR 57. Existing trees along the perimeter of campus would remain and additional trees would be planted where needed.

The City of Fullerton Municipal Code Section 09.06 states that the City has jurisdiction over planning, planting, maintenance and removal of all trees and other landscape material within the City's ROW (City of Fullerton 1995). Furthermore, tree trimming and removal of any City-owned street tree must be conducted by the City's contractor, West Coast Arborists, following a request to the Public Works department (City of Fullerton 2019b). If trees within the City's ROW are proposed to be altered in any way as part of the Campus Master Plan, a service request shall be submitted to the City of Fullerton Landscape Division. However, all tree planting and maintenance activities under the Campus Master Plan would occur on the CSUF campus. Campus tree planting and maintenance activities on the CSUF campus are regulated by Campus Master Plan design frameworks, not by the City of Fullerton. Therefore, the Campus Mater Plan would not conflict with any local policies or ordinances, and no impact would occur.

*f. Conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.*

The Fullerton Plan Natural Environment Element encompasses the campus (City of Fullerton 2012). The City of Fullerton does not have jurisdiction over CSUF; however, CSUF considers aspects of local plans and policies for the communities surrounding the campus when it is appropriate and feasible, although it is not bound by those plans and policies in its planning efforts. The Fullerton Plan Natural Environment Element provides guidelines for water, air quality and climate change, integrated waste management, open space and natural resources, and natural hazards. Based on the analysis completed in the BRAM (Appendix N) and summarized above, the Campus Master Plan would not have any impacts to biological resources including native habitats or waterways. The campus is not subject to any Habitat Conservation Plan, Natural Conservation Community Plan, or additional local, regional, or state habitat conservation plan. Therefore, the Campus Master Plan would not conflict with any adopted or approved plans and would have no impact.

### 4.13.3 Geology and Soils

The CEQA Guidelines Appendix G states that a significant hazardous and hazardous materials impact may result if the project would:

*e. Have soils incapable of adequately supporting the use of septic tanks or alternative wastewater disposal systems where sewers are not available for the disposal of wastewater.*

The CSUF campus is connected to existing water and sewer infrastructure, further described in Section 4.12, *Utilities and Service Systems*, of this EIR. The Campus Master Plan does not include the use of septic tanks or alternative wastewater disposal systems. Therefore, it would have no impact associated with soil adequacy for septic tanks or alternative wastewater disposal systems.

### 4.13.4 Hazards and Hazardous Materials

The CEQA Guidelines Appendix G states that a significant hazardous and hazardous materials impact may result if the project would:

- a. Create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials;*
- b. Create a significant hazard to the public or the environment through reasonably foreseeable upset and accident conditions involving the release of hazardous materials into the environment.*

The uses envisioned under the Campus Master Plan are essentially a continuation and expansion of existing uses. Campus operations and maintenance currently utilize relatively small amounts of hazardous materials, such as chemicals associated with laboratory research, heating and cooling system fluids, fuel for maintenance equipment, solvents, cleaning products, pesticides/fertilizers, asbestos in building materials, and other similar chemicals. These materials would continue being used under the Campus Master Plan and would not be substantially different from household chemicals and solvents already in general and wide use. The findings in this discussion are based on the Hazardous Materials Report (Appendix P).

Protocols established for current and future campus operational and maintenance activities adhere to applicable local, state, and federal laws regulating the use and transport of hazardous materials. For example, the FFD and the State of California Occupational Safety and Health Administration (CalOSHA) regulate the use, storage, and handling of hazardous materials within the CSUF campus. The FFD is also responsible for the enforcement of all local, state, and federal codes related to the safe occupancy of buildings. These codes inherently safeguard life and property from the hazards of fire, the fire/explosion hazards arising from the storage, handling, and use of hazardous substances, materials, and devices, as well as hazardous conditions due to the use or occupancy of buildings. CalOSHA protects workers and the public from occupational safety hazards through its Occupational Safety and Health program and provides consultative assistance to employers to help ensure a safe working environment.

Chemical safety training is required for all students who work with chemicals, in order to minimize the occurrence of accidental chemical releases and ensure that, when one does occur, it is handled in a safe manner. Material Safety Data Sheets (MSDS), which outline procedures to address spills and leaks for individual chemicals, are reviewed during training conducted under the federal Hazard Communication Standard (29 CFR 1910.1200) and the Laboratory Standard (29 CFR 1910.1450). Copies of MSDSs are received with shipments of new materials and are maintained in each applicable work location. The CSUF campus has existing plans that address hazard communication,

and the management of hazardous materials and wastes. These plans provide campus-wide procedures for the proper storage, labeling, handling and use, and disposal of hazardous materials (CSUF 2018a; CSUF 2019b). The Campus Master Plan does not entail transport, use, or disposal of substantial amounts of hazardous substances, and implementation of projects under the Campus Master Plan would not create conditions that would release hazardous materials into the environment. Therefore, the Campus Master Plan would have a less than significant impact.

*c. Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school.*

The CSUF campus is a school itself. Three additional schools within a one-quarter mile radius of the campus include the following:

- La Vista High School (909 North State College Boulevard), approximately 100 feet to the west of the CSUF campus
- Troy High School (2200 Dorothy Lane), approximately 400 feet to the west of the CSUF campus
- Hope International University (2500 Nutwood Avenue), approximately 100 feet to the south of the CSUF campus
- Marshall B. Ketchum University (2575 Yorba Linda Boulevard), approximately 100 feet to the north of the CSUF campus

Potential impacts associated with the transport, use, or disposal of hazardous materials are discussed above in response to criteria 'a' and 'b.' As described therein, proposed campus renovations, educational, residential, and recreational uses would not involve the transport, use, or disposal of substantial amounts of hazardous substances. As stated above, the US Department of Transportation regulates the transportation of hazardous materials through implementation of the Hazardous Materials Transportation Act. Therefore, the Campus Master Plan would have a less than significant impact on the emission or handling of hazardous materials in the vicinity of schools.

*d. Be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment.*

A review of the USEPA's Superfund National Priorities List found that there are no superfund sites within CSUF or immediate vicinity. CSUF is not listed as a hazardous materials site according to the DTSC EnviroStor and the SWRCB GeoTracker databases. According to the EnviroStor database, one site formerly located at La Vista High School (approximately 100 feet west of CSUF) was identified as containing hazardous materials; however, the site was closed and requires no further action, and presents no potential hazard (DTSC 2019).

The GeoTracker database contains four sites in the campus that were previously contaminated; chiefly, gasoline contamination on the ground (SWRCB 2019). All four sites have been cleaned, closed, and require no further action. There are several additional former contamination sites in the immediate vicinity of the campus, but all were cleaned and closed. The nearest open site is located approximately 0.35 mile east of the campus at 2960 E. Yorba Linda Boulevard (gas station) and is undergoing site cleanup. Therefore, implementation of the Campus Master Plan would not create a significant hazard to the public or environment and no impact would occur.

- e. For a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area.*

The Fullerton Municipal Airport is located approximately five miles west of CSUF. The campus is not located in the planning area or impact zone for the Fullerton Municipal Airport or any other airport land use plan (Orange County Airport Land Use Commission [ALUC] 2019). Additionally, proposed construction and operational activities under the Campus Master Plan would not pose a safety hazard for people residing or working on the campus since proposed uses under the Campus Master Plan would be similar in nature to existing college campus uses, and Campus Master Plan projects would be phased with construction management plans. Project noise impacts are discussed in detail in Section 4.7, *Noise*; wherein the analysis concludes that the Campus Master Plan would have a less than significant noise impact with implementation of mitigation measures specific to impact construction noise and vibration, and operation of HVAC units.

Further, although projects under the Campus Master Plan include the construction of several multistory buildings, the campus is not located within the height restriction zone for Fullerton Municipal Airport or any other airport. Therefore, no impact would occur.

- f. Impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan.*

The Campus Master Plan would maintain and/or enhance existing access points to and internal circulation routes on the campus. The FFD and the DSA are required to complete an access compliance review and a fire and life safety review prior to approval of individual project drawings and specification documents. Therefore, emergency access on and throughout the campus and general area would be ensured, and implementation of the Campus Master Plan would have no impact on adopted emergency response or evacuation plans.

- g. Expose people or structures, either directly or indirectly, to a significant risk of loss, injury or death involving wildland fires.*

Wildfire hazards are discussed below in Section 4.13.9, *Wildfire*. The campus is located in an urbanized area with no adjacent wildlands, and is not located in a fire hazard severity zone as shown on California Department of Forestry & Fire Protection's (CAL FIRE) fire hazard severity zone map and on Exhibit 28, *Fire Hazard Severity*, in the Fullerton Plan Natural Environment Element (CAL FIRE 2011; City of Fullerton 2012). The Campus Master Plan would not directly or indirectly expose people or structures to wildfires and no impact would occur.

#### 4.13.5 Hydrology and Water Quality

The CEQA Guidelines Appendix G states that a significant impact on hydrology and water quality may result if the project would:

- a. Violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or groundwater quality;*
- e. Conflict with or obstruct implementation of a water quality control or sustainable groundwater management plan.*

Projects under the Campus Master Plan would be required to comply with all applicable stormwater discharge regulations. Potential water quality impacts associated with project construction include

erosion, sedimentation, and potential hazardous material discharge from construction equipment and materials. Projects under the Campus Master Plan would collectively result in land disturbance of more than one acre and would therefore be required to comply with NPDES regulations for construction stormwater discharge, and the development of a SWPPP, required by the Construction General Permit, General Permit Order 2009-0009-DWQ.

The campus, is a Non-Traditional Phase II Small Municipal Separate Storm Sewer System Program (MS4) operator under the CSU systemwide Phase II Stormwater Discharge Permit (Phase II MS4 Permit, Order Number 2013-0001-DWQ) administered by the SWRCB, due to the existing conveyance systems (such as roads with drainage systems, streets/roadways, catch basins, curbs, gutters, and a storm drain system) that serve the campus (CSUF 2018b; CSUF 2019a). As such, the campus is required to comply with LID requirements for all regulated projects—which are defined as projects creating and/or replacing 5,000 sf or more of impervious area – to ensure the implementation of appropriate stormwater BMPs, including but not limited to pollution prevention, post-construction stormwater management programs, and BMP effectiveness assessments. Stormwater retention and treatment features must be designed to capture runoff from the 85<sup>th</sup> percentile, 24-hour storm event; 80 percent of the annual runoff; or flow from either 0.2 inch per hour rainfall intensity or twice the 85<sup>th</sup> percentile hourly rainfall intensity as determined by local rainfall records.

CSUF has a campus-wide Storm Water Management Program that includes 12 BMPs, which aim to address stormwater threats from operational and maintenance activities for the campus (CSUF 2018b; CSUF 2019a). Therefore, projects under the Campus Master Plan would require compliance with the NPDES Construction General Permit during construction activities and compliance with CSUF's Storm Water Management Program during use, operation, and maintenance of the CSUF campus under Campus Master Plan full buildout. Compliance with all applicable regulations and measures setting water quality standards and waste discharge requirements ensure the Campus Master Plan would have a less than significant impact.

*b. Substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin.*

The geography and the CSUF's continued compliance with stormwater runoff regulations would reduce the Campus Master Plan's impact on groundwater resources. The City provides water service to the campus and would continue to do so under the Campus Master Plan. No on-site groundwater wells are proposed as part of the Campus Master Plan; therefore, impacts to groundwater supplies, depletion of aquifer volume, or lowering of the local groundwater table level would be limited to the well field from which the OCWD derives its supplies.

The City receives its water from two main sources: well water from the Lower Santa Ana River Groundwater Basin, which is managed by the OCWD, and imported water from MWD (City of Fullerton 2017). The City is a member agency of MWD, which delivers surface water from the State Water Project and Colorado River. The City has 11 wells, located in the southern sector of the City. Six of these wells are located at the main plant in the City of Anaheim just south of the City boundary. Five of these six wells pump into a forebay before pumping the water into the distribution system. Water pumped from these wells has been naturally filtered as it passes through underlying aquifers of sand, gravel, and soil (City of Fullerton 2017). As of 2015, the City had 32,000 connections, served a population of 140,827 people in a 22.3-square mile service area, and supplied about 27,200 acre-feet (AF) of water from 2014 to 2015, of which about 18,900 AF (or 70 percent) was sourced from groundwater (City of Fullerton 2017).

The Campus Master Plan includes replacement and renovation of several campus facilities, and construction of additional student housing and campus amenities buildings at full buildout as described in Section 2, *Project Description*. All projects under the Campus Master Plan would be within the existing footprint of the developed CSUF campus; therefore, increases in campus water demand would be incremental as phased construction proceeds to accommodate future enrollment growth. Proposed renovation and construction under the Campus Master Plan would be subject to water-efficient plumbing codes and other applicable water-saving measures implemented by the City and MWD. Renovations of existing buildings are likely to achieve significant water savings on a per-capita basis due to the incorporation of modern plumbing codes and low-flow fixtures. Because building renovations would likely reduce per-capita water usage, and because athletic fields would not be created or expanded, increases in water demand are anticipated to primarily consist of indoor water uses associated with new facilities.

CalEEMod was used to estimate the potential net increase in water demand associated with buildout of the Campus Master Plan. As discussed in Section 4.12, *Utilities and Service Systems*, the Campus Master Plan would result in a net increase of approximately 1,570 AFY, with the majority of this increase attributable to proposed student and faculty housing to be constructed under the Campus Master Plan. The Campus Master Plan's anticipated increase in demand would be within the projected 2020 to 2040 demand increases assumed in the City's 2015 UWMP. However, the Campus Master Plan would account for nearly all the anticipated increase in residential, commercial, and institutional/governmental land between 2020 and 2040 assumed in the City's 2015 UWMP (City of Fullerton 2017).

As described in Section 4.12, *Utilities and Service Systems*, the campus is in a portion of Fullerton served by both imported water from MWD and local groundwater (Fullerton n.d.). The City's anticipates purchasing up to 8,667 AFY of imported water from MWD to meet demand through 2040, however this amount is substantially less than the City has historically purchased from MWD and less than its Tier 1 maximum limit of 11,299 AFY accounted for by MWD in its 2015 UWMP (MWD 2016). As such, it is anticipated that future increases in demand would generally be met with additional imported supply from MWD, which would not decrease groundwater supplies or interfere substantially with groundwater recharge.

Section 4.12, *Utilities and Service Systems*, incorporates Mitigation Measures U-1 and U-2, which would require project-specific assessments of water supply availability and outdoor water conservation measures, respectively. Such measures would confirm the adequacy of water supplies prior to construction of individual projects under the Campus Master Plan and reduce potential demand associated with landscaping and irrigation. Finally, pursuant to the requirements of the Sustainable Groundwater Management Act, OCWD recently prepared and submitted an alternative to a groundwater sustainability plan demonstrating that the groundwater basin has operated within its sustainable yield for over a decade and avoided the undesirable effects of groundwater overdraft. The sustainable yield analysis was approved by the DWR in July 2019 (DWR 2019). Given that the Campus Master Plan would be served by existing supplies and/or imported water and the underlying groundwater basin has and continues to operate within its sustainable yield, the Campus Master Plan would not substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the Campus Master Plan may impede sustainable groundwater management of the basin. This impact would be less than significant.

- c. *Substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river or through the addition of impervious surfaces, in a manner which would:*
- i. *Result in substantial erosion or siltation on- or off-site;*
  - ii. *Substantially increase the rate or amount of surface runoff in a manner which would result in flooding on- or off-site;*
  - iii. *Create or contribute runoff water which would exceed the capacity of existing or planned stormwater drainage systems or provide substantial additional sources of polluted runoff; or,*
  - iv. *Impede or redirect flood flows.*

The campus is largely developed with existing academic uses associated with the University. Such uses include substantial impervious surface cover and, consequently, buildout under the Campus Master Plan would not be expected to result in substantial alterations to drainage patterns. As described above and in Section 4.12, *Utilities and Service Systems*, CSUF is regulated under the Phase II MS4 Permit, which requires all regulated projects—defined as projects creating and/or replacing 5,000 square feet or more of impervious area—to incorporate LID measures, including stormwater retention and treatment features. Such stormwater retention features must capture runoff from the 85<sup>th</sup> percentile, 24-hour storm event; 80 percent of the annual runoff; or flow from either 0.2 inch per hour rainfall intensity or twice the 85<sup>th</sup> percentile hourly rainfall intensity as determined by local rainfall records. Potential retention features that may be incorporated into individual project designs include detention basins, biofiltration/catchment basins, or constructed wetland features. Given the size of proposed facilities, it is anticipated that all individual projects constructed under the Campus Master Plan would constitute regulated projects under the Phase II MS4 Permit and, therefore, would be required to demonstrate compliance with the stormwater capture requirements described in the permit.

Incorporation of stormwater retention features would reduce potential impacts to the existing or planned stormwater drainage system while also treating runoff through physical (i.e., filtration, settling) and biological (i.e., phytoremediation/plant uptake, microbial treatment) processes. Retention features would also reduce the volume and flow of runoff, minimizing downstream erosion, sedimentation, and flooding impacts. As such, Campus Master Plan impacts related to alteration of drainage patterns would be less than significant.

- d. *In flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation.*

The campus is approximately 16 miles inland from the Pacific Ocean, and the City is approximately 150 feet above mean sea level (City of Fullerton 2012). The majority of the campus is not located in a flood zone, according to Exhibit 30, *100 Year and 500 Year Flood Risk*, in the Fullerton Plan Natural Environment Element and the Federal Emergency Management Agency's (FEMA) Flood Insurance Rate Map (City of Fullerton 2012; FEMA 2009). The west boundary of the campus along North State College Boulevard is located in FEMA Zone X, an area with a 0.2 percent annual flood chance. The campus is not in the vicinity of any surface waters that may cause seiches, and earthquake-induced seiches are not considered a risk in the City of Fullerton according to the City's Local Hazard Mitigation Plan (City of Fullerton 2010). Therefore, the Campus Master Plan would not be exposed to impacts from flood, tsunami, or seiche events and there would be no impact.

#### 4.13.6 Land Use and Planning

The CEQA Guidelines Appendix G states that a significant impact on land use and planning may result if the project would:

*a. Physically divide an established community.*

The campus is located in the eastern portion of the City of Fullerton, adjacent to SR 57 which travels north-south along the eastern city limits. The CSUF campus is located in the Education Focus Area according to The Fullerton Plan and is adjacent to and surrounded by other existing Universities, single- and multi-family neighborhoods, and commercial retail development. The campus is developed with academic, recreational, maintenance, and housing facilities.

The Campus Master Plan includes the replacement and renovation of several campus facilities, and construction of additional student housing and campus amenities buildings at full buildout as described in Section 2, *Project Description*. The redevelopment under the Campus Master Plan would occur entirely within the existing campus footprint and does not propose an extension of campus outside of the existing campus boundaries, nor propose or create the need for new roadways. Utility infrastructure improvements would be temporary and would not encroach or impact existing neighborhoods or the surrounding community.

The on-campus community consists of students (undergraduate and graduate), faculty, and staff. The Campus Master Plan includes renovation and development of specific buildings and facilities on the existing campus which could temporarily impact travel within and use of on-campus facilities. Development under the Campus Master Plan would occur in phases over the planning period as more housing and facilities are needed and in order to maintain all campus functions by developing areas of campus at appropriate and strategic times. Overall, the Campus Master Plan would build upon the existing campus framework and development in order to accommodate increases in enrollment, would improve on-campus amenities, and would not divide the on-campus community. Therefore, the Campus Master Plan would not physically divide the established community and no impact would occur.

*b. Cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect.*

The City of Fullerton does not have jurisdiction over CSUF; however, CSUF considers aspects of local plans and policies for the communities surrounding the campus when it is appropriate and feasible, although it is not bound by those plans and policies in its planning efforts. CSUF communicates with local organizations, associations, and elected representatives about planning efforts and considers community input.

While the majority of the proposed renovation and construction would be concentrated in the center of campus, some of the changes would occur on the periphery, near campus edges along Nutwood Avenue to the south and North State College Boulevard to the east. Development would be consistent with the area's existing and planned land uses, including commercial, educational, and multi-family housing facilities.

The intensity of use and development on the CSUF campus would increase incrementally throughout the next 20 years. These improvements would be consistent with the overarching land use development goals and vision for both the CSUF campus and the City of Fullerton Education Focus Area. As previously discussed, goals of the Campus Master Plan include improving connectivity and cohesion of physical spaces on campus and strengthen connections to surrounding

off-campus areas, which supports the goal of Education Focus Area to integrate the colleges and universities with the surrounding area. Development under the Campus Master Plan would be consistent with applicable existing City and regional programs, plans, and policies as they relate to transportation or land use. Access and circulation routes into the campus along Yorba Linda Boulevard, North State College Boulevard, and Nutwood Avenue would remain the same. Proposed transit hubs would be harmonious with the Education Focus Area's goal to maintain adequate and managed capacity for parking needs and increasing multi-modal transportation options.

As discussed in Section 4.1, *Aesthetics*, development under the Campus Master Plan would include physical changes to the campus that would alter its visual character and quality and increase overall massing and intensity within the campus. New facilities would not impact scenic views on or off-campus, including those from state scenic highways, and would be constructed in conformance with existing state and CSU guidelines and policies, including the CSU Outdoor Lighting Design Guidelines which state that the lighting aesthetic must compliment the campus architecture and should be consistent between similar areas across the campus. Construction impacts to aesthetics would be temporary and periodic and not substantially impact sensitive viewers. Therefore, the Campus Master Plan would not conflict with local land use policies regarding scenic views or light and glare.

As discussed in Section 4.7, *Noise*, increases in noise levels on surrounding residential properties could result in land use compatibility impacts, but they would be temporary, periodic, and less than significant with mitigation. Additionally, new campus buildings may be exposed to exterior noise levels in exceedance of the City of Fullerton's conditionally acceptable exterior noise level for residential land uses, but mitigation would reduce impacts to less than significant levels. Traffic noise increases would be negligible and would not contribute to a noise level increase that exceeds impact criteria, including under future cumulative conditions.

Therefore, the Campus Master Plan would not cause a significant environmental impact due to a conflict with any land use plan, policy, or regulation adopted for the purpose of avoiding or mitigating an environmental effect, and impacts would be less than significant.

#### 4.13.7 Mineral Resources

The CEQA Guidelines Appendix G states that a significant impact on mineral resources may result if the project would:

- a. *Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state;*
- b. *Result in the loss of availability of a locally-important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan.*

No portions of CSUF are utilized for mineral extraction. The City of Fullerton does not contain any land uses within City jurisdiction for mining or mineral extraction activities as shown on Exhibit 2, *Community Development Plan*, in the Fullerton Plan Community Development and Design Element (City of Fullerton 2012). The campus is designated as being within Mineral Resource Zone 1 (MRZ-1), which is defined as an area where geological information indicates no significant mineral deposits are present (DOC 1995).

Therefore, implementation of the Campus Master Plan would not result in loss of availability of a known mineral resource or a locally-important mineral resource recovery site delineated on a local general plan, specific plan, or other land use plan, as no known mineral resources are located in the campus (City of Fullerton 2012; DOC 1995). Implementation of the Campus Master Plan would also

not change access or ability to recover known mineral resources in other parts of Orange County. No impacts would occur.

#### 4.13.8 Noise

The CEQA Guidelines Appendix G states that a significant impact on noise may result if the project would:

- c. expose people residing or working in the project area to excessive noise levels for a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport.*

The Campus Master Plan site is located approximately 5.6 miles east of Fullerton Municipal Airport. The Campus Master Plan site is not located within the Airport Land Use Plan and is not within the airport's 65 dBA noise contours (ALUC 2004). Fullerton Municipal Airport is a general aviation use airport and not a private airstrip. There are no private airstrips within the vicinity of the Campus Master Plan. Therefore, the Campus Master Plan would not expose people to excessive noise levels related to airports or private airstrips, and no impacts would occur.

#### 4.13.9 Wildfire

The CEQA Guidelines Appendix G states that a significant impact on wildfire may result if the campus is located in or near state responsibility areas or lands classified as very high fire hazard severity zones and would:

- a. Substantially impair an adopted emergency response plan or emergency evacuation plan;*
- b. Due to slope, prevailing winds, and other factors, exacerbate wildfire risks and thereby expose project occupants to pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire;*
- c. Require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment;*
- d. Expose people or structures to significant risks, including downslopes or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes.*

CSUF is not located in a fire hazard severity zone, as shown on California Department of Forestry & Fire Protection's (CAL FIRE) fire hazard severity zone map and on Exhibit 28, *Fire Hazard Severity*, in the Fullerton Plan Natural Environment Element (CAL FIRE 2011; City of Fullerton 2012). Moderate fire hazard severity zones are located approximately one-mile northwest of the campus and high to very high fire severity zones are located in the northwest corner of City boundaries, approximately two to five miles from the campus. There are no fire severity zones in the immediate vicinity of the campus, which is surrounded by existing development.

Implementation of the Campus Master Plan would not impair existing emergency response or evacuation plans, nor require installation or maintenance of infrastructure that would exacerbate fire risks. CSUF is developed with relatively flat topography and proposed uses under the Campus Master Plan would remain the same as current uses (educational institution). No impacts associated with wildfire hazards would occur.

## 5 Cumulative Impacts

---

The geographic area that could be affected by the project and is appropriate for a cumulative impact analysis varies depending on the environmental resource topic, as presented in Table 5-1. Local geographic area refers to the immediate campus vicinity (e.g., the plan area and surrounding public viewpoints with respect to aesthetics).

### 5.1 Introduction to the Cumulative Analysis

This EIR provides an analysis of cumulative impacts of the Campus Master Plan taken together with other past, present, and probable future projects producing related impacts, as required by Section 15130 of the CEQA Guidelines. The goal of such an exercise is twofold: first, to determine whether the overall long-term impacts of all such projects would be cumulatively significant; and second, to determine whether the incremental contribution to any such cumulatively significant impacts by the Campus Master Plan would be “cumulatively considerable,” and thus significant (CEQA Guidelines Sections 15130[a]–[b], Section 15355[b], Section 15064[h], and Section 15065[c]; and *Communities for a Better Environment v. California Resources Agency* [2002] 103 Cal. App. 4th 98, 120). The analysis intends first to create a broad context in which to assess cumulative impacts, viewed on a geographic scale beyond the campus, and then to determine whether the Campus Master Plan’s incremental contribution to any significant cumulative impacts from all projects is itself significant (i.e., cumulatively considerable).

Cumulative impacts are defined in CEQA Guidelines Section 15355 as “two or more individual effects which, when considered together, are considerable or which compound or increase other environmental impacts.” A cumulative impact occurs from “the change in the environment which results from the incremental impact of the project when added to other closely related past, present, and reasonable foreseeable probable future projects. Cumulative impacts can result from individually minor but collectively significant projects taking place over a period of time” (CEQA Guidelines Section 15355[b]).

Consistent with CEQA Guidelines Section 15130, the discussion of cumulative impacts in this EIR focuses on significant and potentially significant cumulative impacts. Section 15130(b) of the CEQA Guidelines provides, in part, the following:

The discussion of cumulative impacts shall reflect the severity of the impacts and their likelihood of occurrence, but the discussion need not provide as great detail as is provided for the effects attributable to the project alone. The discussion should be guided by the standards of practicality and reasonableness, and should focus on the cumulative impact to which the identified other projects contribute rather than the attributes of other projects which do not contribute to the cumulative impact.

A project is considered to have a significant cumulative effect if:

- The cumulative effects of development without the project are not significant and the project’s additional impact is substantial enough, when added to the cumulative effects, to result in a significant impact; or
- The cumulative effects of development without the project are already significant and the project contributes measurably to the effect.

The term “measurably” is subject to interpretation. The standards used herein to determine measurability are that the impact must be noticeable to a reasonable person or must exceed an established threshold of significance (defined throughout the resource discussions in Section 4 of this EIR).

## 5.2 Cumulative Setting

### 5.2.1 Geographic Scope

The geographic area that could be affected by the Campus Master Plan and is appropriate for a cumulative impact analysis varies depending on the environmental resource topic, as presented in Table 5-1. In general, local geographic area refers to the immediate vicinity (e.g., the campus and surrounding public viewpoints with respect to aesthetics). Regional, within the context of this EIR, refers to the County, but could refer to an applicable habitat conservation plan area or other regional plan area.

**Table 5-1 Geographic Scope of Cumulative Impacts**

<b>Resource Topic</b>	<b>Geographic Area</b>
Aesthetics	Local (plan area and surrounding public viewpoints)
Air Quality	Regional (South Coast Air Quality Management District) Local (immediate vicinity – pollutant emissions that are highly localized)
Archaeological, Historical, and Tribal Cultural Resources	Local (plan area and surrounding communities)
Energy	Regional (SCE energy grid)
Greenhouse Gas Emissions	Global
Hydrology and Water Quality	Regional (watershed and groundwater basin) and Local (campus vicinity)
Noise	Local (immediate campus vicinity)
Population and Housing	Regional and Local (CSUF campus, City of Fullerton, and surrounding communities within County)
Public Services	Local (CSUF campus, City of Fullerton)
Recreation	Local (CSUF campus, City of Fullerton)
Transportation	Regional and Local (CSUF campus, City of Fullerton, and surrounding communities within County)
Utilities and Service Systems	Local (utility service areas)

As noted in Table 5-1, the potential geographic scope of some cumulative effects is more localized than others. To account for both regional and localized cumulative impacts, this EIR uses regional growth projections to assess regionally cumulative impacts and the list method to assess more localized cumulative impacts. Table 5-2 lists past, present, and future development projects in the vicinity of the campus. This list is not intended to be an all-inclusive list of projects in the region, but rather an identification of projects constructed, approved, or under review in the vicinity of the campus that have some relation to the environmental impacts of construction and operation of potential uses associated with implementation of the Campus Master Plan.

Table 5-2 Cumulative Projects List

Project Number	Project Name	Developed or Proposed Land Use	Size (acreage, sf, or dwelling units)	Status
1	West Coyote Hills	Residential, open space, and commercial	513 acres	Approved
2	Fullerton Fox Theatre on North Harbor Boulevard (Redevelopment)	Commercial	21,025 sf	Design
3	Apartments on Franklin Avenue	Residential	7 units	Construction
4	Retail Construction on S. Placentia Avenue	Gas station, retail	371,000 sf	Construction
5	Apartments on E. Brookdale Place	Residential	9 units	Construction
6	Subdivision on Ladera Vista Drive	Residential	2 single-family lots	Construction
7	Amplifi Apartments	Residential	290 units	Construction
8	Fox Block Mixed Use Development	Residential, retail, office	TBD	Design
9	Raymond and Wilshire Retail Development	Convenience store	2,750 sf	Construction
10	Oakmont Residential Care Facility	Residential	95 units	Construction
11	Shopping Center Remodel on Raymond Avenue and Commonwealth Avenue	Retail	50,000 sf	Construction
12	Shopping Center Remodel at North Harbor Boulevard	Retail	104,000 sf	Plan review
13	Commercial Remodel on West Orangethorpe Avenue at Pacific Drive	Retail	9,600 sf	Planned for construction
14	New Medical Office	Medical office	2,245 sf	Planned for Construction
15	New Office Building on East Amerige Avenue	Office	27,000 sf	Application review
16	New Industrial Building on East Walnut Avenue	Industrial	36,750 sf	Plan review
17	New drive-through Coffee Shop on South Harbor Boulevard	Commercial	3,000 sf	Planned for construction
18	Affordable Apartments on East Santa Fe Avenue	Residential	55 units	Plan review
19	Residential Condos on East Bastanchury Road	Residential	33 units	Application review

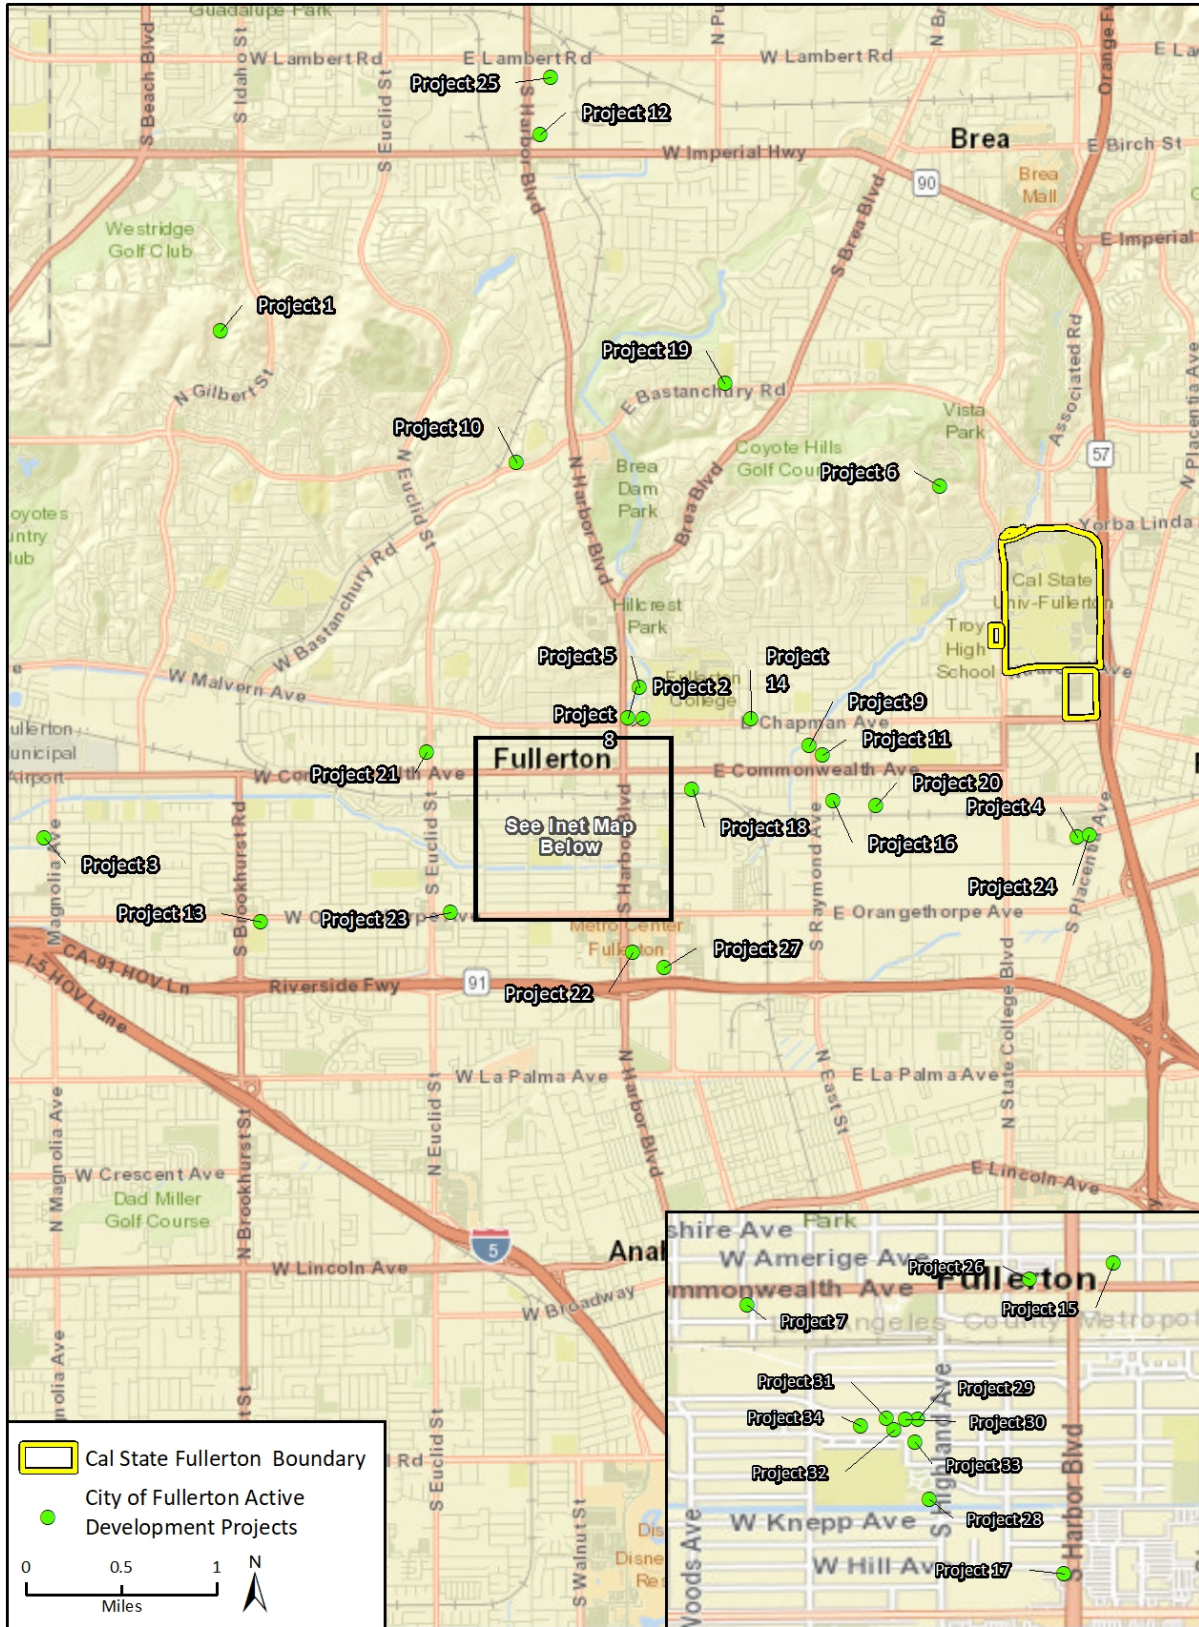

California State University, Fullerton  
**California State University, Fullerton Master Plan Update**

<b>Project Number</b>	<b>Project Name</b>	<b>Developed or Proposed Land Use</b>	<b>Size (acreage, sf, or dwelling units)</b>	<b>Status</b>
20	Industrial Reuse on East Walnut Avenue	Industrial	118,480 sf	Plan review
21	New Commercial Building on North Euclid Street	Commercial	3,242 sf	Planned for construction
22	The Broken Yolk Restaurant	Commercial	4,966 sf	Planned for construction
23	New Restaurant and Commercial Building on West Orangethorpe Avenue	Commercial	4,594 sf	Planned for construction
24	Farmer Boys Restaurant	Commercial	3,207 sf	Planned for construction
25	Beckman Business Center	Industrial	900,000 sf	Construction
26	Commercial Façade Remodel on West Commonwealth Avenue	Commercial	5,000 sf	Planned for construction
27	Bowlero-Bowling Alley on South Harbor Boulevard (Redevelopment)	Commercial	40,610	Planned for construction
28	Melia Homes New Multi-Family Development	Residential	19 units	Plan review
29	Affordable Apartments on West Valencia Drive	Residential	5 units	Construction
30	Affordable Housing on West Valencia Drive	Residential	5 units	Construction
31	Affordable Apartments on West Valencia Drive	Residential	17 units	Construction
32	Affordable Apartments on West Avenue	Residential	2 units	Construction
33	Affordable Apartments on South Ford Avenue	Residential	17 units	Construction
34	Habitat for Humanity Residential Development	Residential	12 units	Construction

Note: sf= square feet

Fig. 5-1 Cumulative Project Development Map

## 5.3 Analysis of Cumulative Impacts

### 5.3.1 Aesthetics Effects

The cumulative context for aesthetic resource impacts for the Campus Master Plan include the existing and planned land uses on and around the campus, including in the City of Fullerton. Development of past and current projects and future projects continue to alter the visual environment of the City and the surrounding area. The projects listed in Table 5-2 represent development and redevelopment resulting in physical changes that would create cumulative aesthetic impacts to the City of Fullerton in combination with development facilitated by the Campus Master Plan.

The largest projects, such as Project 1, Project 12, and Project 25 included in Table 5-2, would have the most potential to cause aesthetic impacts. However, these projects are not located in the vicinity of CSUF and not visible from public vantage points on or adjacent to campus, and not located in the same viewshed. Development projects in the City of Fullerton are required to comply with the policies concerning community character, design, and aesthetics of the Fullerton Plan, the City's Municipal Code, and the City's Scenic Corridor Design Guidelines. This provides a framework for future development to enhance community cohesion and visual identity, ensure design compatibility, strengthen linkages between the universities and surrounding community, and preserve natural amenities and views.

The Campus Master Plan would not significantly contribute to cumulative impacts concerning scenic views or visual character in combination with the projects listed in Table 5-2. As discussed in Section 4.1, *Aesthetics*, development under the Campus Master Plan would not impede or degrade views from scenic highways or roadways, or scenic views of or from the distant mountains or hillsides. Cumulative impacts would be less than significant with respect to scenic views or visual character.

Cumulative effects of lighting are visible over a wide area, and collective lighting from development in close proximity can create skyglow, which would be a significant cumulative impact. The campus and surrounding areas are located in a built, urban setting and experience lighting in the form of streetlights, illumination for paths, buildings, and other facilities and structures. As described in Section 4.1, implementation of the Campus Master Plan would introduce new lighting sources; however, these sources would be similar to existing sources, and lighting regulations under CalGreen would limit light trespass and glare on nonresidential development in and around CSUF. As shown in Figure 5-1 above, surrounding projects are spread out throughout the City, not located in the immediate vicinity of CSUF, and would not concentrate light in a single area where CSUF is located. Therefore, cumulative impacts to skyglow would be less than significant.

### 5.3.2 Air Quality Effects

The cumulative context for air quality is regional. The SCAB is designated a nonattainment area for the federal and state one-hour and eight-hour ozone standards, the state PM<sub>10</sub> standards, the federal 24-hour PM<sub>2.5</sub> standard, and the federal and state annual PM<sub>2.5</sub> standard. SCAB is in attainment of all other federal and state standards. The Campus Master Plan would contribute particulate matter and the ozone precursors ROG and NO<sub>x</sub> to the area during construction and operation. As described under Impact AQ-2, in Section 4.2, *Air Quality*, regional emissions during construction would not violate an air quality standard or contribute substantially to an existing or projected air quality violation; and would be less than significant. With respect to localized impacts,

the consideration of cumulative construction particulate matter impacts is limited to cases when projects constructed simultaneously are within a few hundred yards of each other because of: (1) the combination of the short range (distance) of particulate dispersion (especially when compared to gaseous pollutants); and (2) the SCAQMD's required dust control measures which further limit particulate dispersion from a project site. Therefore, with the implementation of dust control measures, the unlikelihood that construction would occur within a few hundred yards of major off-site construction, and compliance with SCAQMD regional construction emission thresholds, the Campus Master Plan would not contribute a cumulatively considerable amount of pollutants from construction emissions.

As discussed in Section 4.2, *Air Quality* under Impact AQ-1 and Impact AQ-2, the Campus Master Plan would exceed operational ROG emissions thresholds, mostly due to consumer product use, and NO<sub>x</sub> emission thresholds, mostly from vehicle trips, and thereby conflict with the adopted AQMP. Therefore, the Campus Master Plan would contribute an amount of operational pollutants that would be cumulatively considerable to the cumulative impacts of the SCAB. Mitigation Measure AQ-1 would reduce ROG emissions, but these reductions would depend on individual consumer behavior that is not quantifiable at this stage of planning, and feasible mitigation measures that would expand upon the Campus Master Plan's TDM are not available to reduce mobile NO<sub>x</sub> emissions. Therefore, the Campus Master Plan's operational emissions would exceed SCAQMD regional thresholds after mitigation and would contribute a significant and unavoidable cumulative considerable amount of pollutants to the SCAB's cumulative impact.

As identified in Section 4.2, *Air Quality*, under Impact AQ-3, the Campus Master Plan would not have a significant impact from CO hotspots, or TACs. Discussion of these impacts considers the cumulative nature of the pollutants in the region; e.g., the cancer risk and non-cancer risk thresholds have been set per existing cancer risks in the area and exceeding those thresholds would be considered a cumulative impact. As the Campus Master Plan does not exceed those thresholds, it would not expose sensitive receptors to a cumulatively considerable amount of substantial pollutant concentrations from CO hotspots or TACs.

As identified in Section 4.2, *Air Quality*, under Impact AQ-4, the Campus Master Plan would not have a significant impact from odor emissions. The consideration of cumulative odor impacts is limited to cases when projects constructed simultaneously are within a few hundred yards of each other because of the short range of odor dispersion. It is unlikely that Campus Master Plan construction would occur within a few hundred yards of major off-site construction, and odors from other projects would also be subject to SCAQMD Rule 402 Nuisance. Therefore, the Campus Master Plan would not result in a cumulatively considerable odor impact.

### 5.3.3 Cultural Resources Effects

#### *Historic Resources*

Cumulative development in the Campus Master Plan area would alter areas that contain and may contain historical resources, including an eligible historic district with associated site plan features, circulation corridors, and landscaping/hardscaping. There are 13 buildings on the CSUF campus as of 2020 that appear eligible for listing on the NRHP and CRHR. As part of the Campus Master Plan, several historical resources would undergo renovation and/or replacement, and new buildings would be constructed adjacent to historic resources. There is the potential for significant cumulative impacts to historic resources through renovation and/or replacement of historical resources and

through additional new construction within the CSUF campus. Therefore, full build-out of the Campus Master Plan could result in significant cumulative historic resource impacts.

#### *Archaeological Resources & Human Remains*

Although no archaeological resources have been identified in the Campus Master Plan area and are not anticipated for other cumulative projects listed in Table 5-2, cumulative development in the vicinity of the campus would disturb areas that may potentially contain previously unknown archaeological resources and/or human remains. While there is the potential for significant cumulative impacts to cultural resources within the vicinity of the campus, it is anticipated that potential impacts associated with individual development projects would be addressed on a case-by-case basis, and that cumulative development projects would be required to comply with similar mitigation described herein for the Campus Master Plan. In addition, as discussed above, archaeological resource and human remain impacts of the Campus Master Plan can be reduced to less than significant impact levels with incorporation of Mitigation Measures CUL-2 and CUL-3. Therefore, significant cumulative impacts on archaeological resources and human remains are not anticipated.

#### *Tribal Cultural Resources*

Although no tribal cultural resources have been identified in the Campus Master Plan area and are not anticipated for other cumulative projects listed in Table 5-2, the potential exists for cumulative development projects to encounter subsurface archaeological resources that may be considered tribal cultural resources. The reduction of tribal cultural resources in the traditional Gabrieleño/Tongva Nation territory caused by cumulative development in the region could result in a significant cumulative impact.

It is anticipated that cumulative development projects would be required to comply with similar mitigation described herein for the Campus Master Plan. In addition, compliance with AB 52 and continued involvement by local Native Americans in regional planning would generally reduce the destruction of tribal cultural resources such that cumulative impacts would be minimized. As such, cumulative impacts to tribal cultural resources would not be significant.

As discussed under Impact TCR-1, no tribal cultural resources have been identified at the campus. Potential impacts to previously unidentified tribal cultural resources would be reduced to a less than significant level with implementation of Mitigation Measures CUL-2 and CUL-3. As implementation of these measures would minimize adverse effects on any potential tribal cultural resources, the Campus Master Plan's contribution to this impact would not be cumulatively considerable.

### 5.3.4 Energy Effects

The Campus Master Plan would involve the use of energy during the construction and operational phases. Energy use during the construction phase would be in the form of fuel consumption (e.g., gasoline and diesel fuel) to operate heavy equipment, light-duty vehicles, and machinery. In addition, temporary grid power may also be provided to any construction trailers or electric construction equipment. Long-term operation of the Campus Master Plan would require permanent grid connections for electricity and natural gas service to power internal and exterior building lighting, and heating and cooling systems.

Several other planned and approved projects identified in Table 5-2 would also receive electricity and natural gas service provided by SCE and SCG. The projects would also consume energy related

to transportation (i.e., gasoline and diesel fuel consumption for passenger vehicles, trucks, buses, and other vehicles) and construction. These projects would be required to comply with the CEC and implement energy efficiency measures to reduce energy demand from buildings. Additionally, they would likely implement similar transportation demand management considerations to reduce vehicle trips and miles traveled, thus reducing fuel consumption. Given the above considerations, there is no evidence suggesting that the implementation of cumulative development would result in wasteful or inefficient use of energy. This impact would be less than significant.

### 5.3.5 Geology and Soils Effects

Geologic and soils impacts are site-specific rather than regional in nature and any development occurring on campus would be subject to, at minimum, uniform site development and construction and regulatory standards relative to seismic and other geologic conditions that are prevalent within the region, such as the California Building Code standards. Cumulative geology and soils impacts would be less than significant.

### 5.3.6 Greenhouse Gas Effects

The impact of GHG emissions generated by the Campus Master Plan, discussed under Impact GHG-1 in Section 4.5, *Greenhouse Gas Emissions*, is inherently cumulative. Each of the planned and pending projects located near CSUF would generate GHG emissions from vehicle trips, electrical and water use, and other sources. GHG emissions from one project cannot, on their own, result in changes in climatic conditions; therefore, the emissions from any project must be considered in the context of their contribution to cumulative global emissions, which is the basis for determining a significant cumulative impact, as noted in Section 4.5.

Projected GHG emissions associated with the Campus Master Plan construction and operation would exceed project-specific thresholds, mainly due to mobile emissions. Therefore, the Campus Master Plan would conflict with emissions reduction plans and goals of the state 2017 Scoping Plan, Executive Order B-55-18, and the ACUPCC.

Implementation of Mitigation Measure GHG-1 would reduce GHG emissions through creation and implementation of a GHG Reduction Plan. At this stage of planning, it is unknown what exact measures would be implemented as part of the plan and therefore reductions are not quantifiable at this time. In addition, it is unknown if the measures would be able to reduce emissions to below the applicable thresholds due to the majority of the emissions coming from mobile emissions. Campus TDM measures have been established to help reduce overall VMT and GHG emissions. TDM implementation includes short term, medium term, and long-term measures that range from first year parking bans to variable parking pricing and overall street improvements. Splitting up campus TDM strategies into three phases helps ensure that CSUF is able to achieve GHG reductions throughout the duration of the Campus Master Plan. Further discussion on proposed TDM measures is discussed in Section 4.11, *Transportation*. Although project design features include TDM implementation that would have the effect of reducing mobile trips that was not included in modeling, ultimately vehicle emissions depend on individual transportation choices that CSUF would not have full control over. Therefore, impacts from GHG emissions would be significant and unavoidable even with mitigation, and the Campus Master Plan would result in a significant and unavoidable cumulatively considerable impact to GHG emissions.

### 5.3.7 Noise Effects

#### Short-Term Cumulative Construction Phase Impacts

Construction-related noise and vibration are typically considered localized impacts, affecting only receptors closest to construction activities. Therefore, unless construction of cumulative projects, including those proposed under the Campus Master Plan, occur in close proximity to each other (i.e., less than 500 feet), and simultaneously, noise and vibration from individual construction projects have a small change of combining to create significant cumulative impacts. There are no projects planned or currently under construction within 500 feet of CSUF. Thus, cumulative noise and vibration impacts from construction are less than significant.

Noise and vibration associated with the construction of new buildings and campus facilities associated with the Campus Master Plan would be intermittent, temporary, and would fluctuate over the course of Campus Master Plan implementation, as new buildings are constructed and existing buildings are maintained and repaired. Mitigation measures have been identified to help reduce noise from construction equipment. Additionally, mitigation measures are in place that would limit construction noise to less-sensitive times of the day, and construction activities would implement construction noise and vibration reducing measures that would minimize construction noise and vibration.

Given that construction activities associated with the Campus Master Plan would be dispersed throughout the entire campus, none of the off-campus projects that are listed in Table 5-2 are located within 500 feet of the Campus Master Plan area. Construction activities would not combine with construction noise and vibration from other construction activities in the area to result in a substantial increase in cumulative noise and vibration levels. Additionally, as on-campus projects listed in Table 5-2 would likely be completed by the time construction under the Campus Master Plan occurs, the potential for construction-generated noise of those projects are not cumulatively considerable with the Campus Master Plan.

#### Long-Term Cumulative Operational Traffic Noise Impacts

As discussed in Section 4.7, *Noise*, the Campus Master Plan's traffic noise increases would be negligible and would not contribute to a noise level increase that exceeds impact criteria, including under future cumulative conditions. Furthermore, based on the development projects listed in Table 5-2, vehicle roadway volumes are not anticipated to substantially increase, thus reducing the potential for cumulative roadway noise impact. Even though traffic in the vicinity of the campus would gradually increase over the course of development of the Campus Master Plan, the contribution would not be cumulatively considerable.

New development associated with the related projects listed in Table 5-2 as well as the Campus Master Plan, would include stationary equipment associated with new event facilities, parking facilities, and building mechanical equipment. However, noise from these projects would be localized and would not combine with noise sources from other related projects in the Campus Master Plan area due to a minimum 500-foot distance between sources. Additionally, mitigation is included as part of the Campus Master Plan that would require event facilities, parking structures, and stationary equipment to be designed and located in such a way that noise is minimized at the nearest receptors. Operational stationary noise sources would not combine with other area sources to result in a substantial increase in cumulative noise and vibration. Cumulative impacts would be less than significant.

### 5.3.8 Population and Housing Effects

As described in Section 4.8, *Population and Housing*, population in the County of Orange is anticipated to increase by approximately eight percent by the year 2040, with the population of the City of Fullerton anticipated to increase by approximately 14,800 residents during that time. Implementation of the Campus Master Plan would allow a substantial increase in student and faculty growth, which could be considered growth inducing. However, the Campus Master Plan would accommodate an increase in on-campus housing which would reduce the demand for off-campus housing.

The addition of on-campus student and faculty/staff housing would increase the housing stock to accommodate approximately 50 percent of the projected number of new residents and would reduce the need for students to commute to campus. Policy P17.10 of the Fullerton Plan, *Housing to Support Educational Facilities*, addresses the city's desire and cooperation to accommodate the student and faculty/staff population growth associated with educational institutions, and provides policies that direct infill development and affordable housing as this type of development would reduce potential for displacement. The projects listed in Table 5-2 would contribute an additional 2 single-family, 471 multi-family housing units, and 95 residential care facility beds, to the housing stock in the City of Fullerton. The Campus Master Plan, in combination with the other planned residential development projects in the area (as listed in Table 5-2), would result in beneficial cumulative impacts associated with the local housing stock and affordability.

Consistent with SCAG's RHNA, future growth is expected to occur in the City of Fullerton and region-wide over the course of the Campus Master Plan planning period, the contribution would not be cumulatively considerable. Based on SCAG's projections, the addition of 8,000 residents under the Campus Master Plan would account for less than one percent of the total area population by 2040 and would not result in substantial unplanned growth. With an average of 2.95 residents per household, and one resident per residential care facility bed, we can anticipate that the probably future residential projects listed in Table 5-2 would add an additional 1,490 residents to the City of Fullerton (DOF 2019). This cumulative increase is not substantial or unplanned. Population and housing impacts related to implementation of the Campus Master Plan would not result in a considerable contribution to cumulative population and housing impacts and impacts would be less than significant.

### 5.3.9 Public Services Effects

Under existing conditions, public services are provided in the plan area and surrounding area by multiple agencies, including the FPD, UPD, OCSCD, and the FFD. As noted by the projects listed in Table 5-2, cumulative development in the region continues to increase the concentration of people and structures within these local public service jurisdictions which in turn increases demand for such services.

The projected 8,000 resident increase in population created by the Campus Master Plan would continue the trend of increasing the demand for public services and could combine with other proposed development projects within the City listed in Table 5-2 to result in a cumulative increase in demand for public services such that new or physically altered governmental facilities would be required to maintain acceptable service ratios, response times, or other performance objectives and the construction of which could cause significant environmental impacts.

The new development and growth detailed in Section 4.8, *Population and Housing*, would occur in existing developed areas where adequate public services currently exist. To the extent that any

potential expansion of public facilities is required to accommodate new development and growth in the area, it is reasonable to assume that these would be expansions of existing facilities. As noted in Section 4.9, *Public Services*, the incremental contribution to the demand for new fire and police protection services and library services would be offset by payment of proportionate property taxes and sales taxes to the City of Fullerton or surrounding jurisdictions. The City of Fullerton's ongoing budget process assesses the needs for FFD, FPD, and Fullerton Library service and infrastructure to meet goals and standards. Therefore, cumulative impacts with respect to fire and police protection facilities and library facilities would be less than significant.

Development projects listed in Table 5-2 would also be required to pay impact fees consistent with local jurisdiction requirements to ensure the adequate provision of future facilities associated with public services, including schools. Therefore, cumulative impacts to public services would be less than significant.

### 5.3.10 Recreation Effects

The geographic context for analysis of cumulative impacts to recreational facilities includes the City of Fullerton and CSUF. Local development has resulted in an increase in demand for recreational resources throughout the region. As discussed in Section 4.10, *Recreation*, the Campus Master Plan would improve recreational opportunities compared to existing conditions and would provide adequate recreational opportunities for students and local residents.

Implementation of the Campus Master Plan and the associated increase in population would result in an increase in the demand for recreational resources. Combined with other projects within the City of Fullerton and surrounding areas, as listed in Table 5-2, development of the Campus Master Plan may result in cumulative impacts to recreational facilities in the City through the increase in demand. The existing park-to-population ratio is approximately 6 acres per 1,000 residents. The forecasted 2040 population of the City of Fullerton is 160,500, which includes the residential projects listed above in Table 5-2, and the anticipated student and faculty/staff increase under the Campus Master Plan. With 160,500 residents, the City's anticipated park-to-population ratio would be 5.34 acres per 1,000 residents, above its park-to-population goal of 4 acres per 1,000 residents. Therefore, the City is not at risk of falling below its standards for park service.

Policy P15.10 under Fullerton Plan and Municipal Code Chapter 21.12, which establishes the use of development impact fees to provide for the acquisition, development, and improvement of public parks and recreational facilities in the City, would offset maintenance needs caused by cumulative increased use. Although development under the Campus Master Plan would increase the use of on-campus and off-campus parks and recreational facilities, existing plans and policies would allow for their continued maintenance. Additionally, the increase in on-campus open space and recreational facilities would offset impacts from the population increase. The preservation, maintenance, and development of new facilities in the Arboretum, and the construction of a new event center, would generate new opportunities for areas of regional recreation. Therefore, the Campus Master Plan would result in less than significant cumulative impacts to existing neighborhood and regional parks or other recreational facilities.

### 5.3.11 Transportation Effects

The 2040 OCTAM model was used to calculate the VMT per Service Population for the City of Fullerton to assess cumulative impacts. The cumulative scenario is consistent with the SCAG RTP/SCS. The 2040 OCTAM model was modified to include the Campus Master Plan to evaluate

cumulative effect on citywide VMT under the Cumulative Plus Project scenario. The same assumptions were included in the OCTAM model for the Cumulative Plus Project scenario.

VMT was estimated using the boundary method. This was completed by selecting all roadway segments in the OCTAM model within the City of Fullerton boundary, and multiplying the number of trips on each roadway segment by the length of that roadway segment.

**Table 5.3 Cumulative Vehicle Miles Traveled**

Study Area	VMT Per Service Population
Existing (City of Fullerton)	22.24
Cumulative (City of Fullerton)	13.19
Cumulative Plus Project	12.86
SCAG RTP/SCS Baseline Target <sup>1</sup>	20.59
SCAG RTP/SCS Plan Target <sup>2</sup>	19.97
<b>Targets Exceeded?</b>	<b>No</b>

<sup>1</sup> According to the 2016 SCAG RTP/SCS, the plan has a target performance result of reducing VMT by 7.4 percent for the region by 2040 between base year (2012) to the 2040 baseline year, which represents a future in 2040 in which only the following have been implemented: transportation projects currently under construction or undergoing right-of-way acquisition; those transportation programs and projects programmed and committed to in the 2015 FTIP; and/or transportation projects that have already received environmental clearance (SCAG 2016).

<sup>2</sup> The plan has a target performance result of reducing VMT by 10.2 percent in the event that all transportation investments and strategies detailed in the 2016 RTP/SCS are fully realized (SCAG 2016).

Source: Fehr & Peers 2019 (Appendix M)

As shown in Table 5.3, the citywide VMT per Service Population under the Cumulative Plus Project scenario would not exceed the SCAG RTP/SCS 2040 VMT reduction targets under 2040 baseline or plan scenarios. Project-generated VMT per Service Population would not cause total citywide VMT to exceed the SCAG’s 2040 target forecasts. Therefore, the Campus Master Plan would have a less than significant cumulative impact.

### 5.3.12 Utility and Service Systems Effects

The cumulative context for water supply/treatment/distribution and wastewater collection/treatment is based on the various agreements between CSUF, the City of Fullerton, and the surrounding region. The cumulative context for solid waste is the City, and the cumulative context for electricity and natural gas facilities is the service area for each utility.

#### Water

As the local water purveyor, the City of Fullerton is responsible for supplying potable water to all residential, commercial, industrial, and fire protection uses within its service area, including the campus. Cumulative development in the Fullerton service area would continue to increase demands on water supplies. By 2040, the City anticipates a total normal year demand of 28,891 AFY, an increase of 2,192 AFY from the anticipated 2020 demands (City of Fullerton 2017). This anticipated increase in demand is based on planned growth within the City’s water service area. As demonstrated in Impact U-5, the Campus Master Plan would account for a substantial portion of the

anticipated growth in residential, commercial, and institutional/governmental water demand between 2020 and 2040, as projected in the City's 2015 UWMP. However, even conservative estimations do not exceed growth that has been accounted for in the City's 2015 UWMP, and the inclusion of State and CSU mandated water conservation policies would further decrease water demand rates. Therefore, cumulative impacts to water supply would be less than significant.

## Wastewater

OCSA's two wastewater treatment plants serve a 479-square mile area covering central and northwest Orange County (OCSA n.d.). OCSA's Treatment Plant No. 2 would receive wastewater flows from the Campus Master Plan and, consequently, it would not contribute to capacity constraints at wastewater treatment facilities outside of OCSA's service area. Impacts would be cumulatively significant if cumulative development in the service area would exceed the capacity of OCSA's Treatment Plant No. 2.

As described in Impact U-1, Treatment Plant No. 2 in Huntington Beach currently treats approximately 127 MGD of wastewater and has a capacity to treat up to 168 MGD, resulting in an excess capacity of approximately 41 MGD.

Planned, pending, and reasonably foreseeable development would continue to increase demands on the existing wastewater treatment and conveyance facilities in the OCSA service area. However, the Campus Master Plan would account for approximately two percent of the remaining capacity at Treatment Plant No. 2. As described in OCSA's Wastewater Collection and Treatment Facilities Master Plan, total influent to OCSA facilities has dropped substantially since 2005, and capacity is no longer the driving factor behind OCSA's capital improvements plan. Furthermore, future projects would be required to obtain commitments from OCSA to provide wastewater treatment services prior to construction, which would be dependent on remaining treatment capacity at OCSA's treatment facilities. Given that the Campus Master Plan would use a nominal fraction of remaining capacity at Treatment Plant No. 2 and that wastewater influent to OCSA facilities is substantially less than previous high flows recorded in the early 2000s, cumulative impacts associated with wastewater services would be less than significant.

## Stormwater

Cumulative development and redevelopment projects in the vicinity of the campus would increase impervious surface area, thereby potentially increasing surface water runoff and associated pollutant loading to waterbodies.

All cumulative development projects would be subject to the requirements of the applicable MS4 permit; projects on the CSUF campus as part of the Campus Master Plan would be required to comply with the statewide Phase II MS4 Permit, while projects off-campus would be subject to the Waste Discharge Requirements for the County of Orange, Orange County Flood Control District, and the Incorporated Cities of Orange County within the Santa Ana Region Areawide Urban Stormwater Runoff (Order No. R8-2009-0030). Both permits require best management practices to capture and treat on-site stormwater runoff for new development and significant redevelopment projects. As a result, on-site stormwater detention infrastructure would expand incrementally with the pace of development in the watershed, reducing peak flows and minimizing the need for new, expanded, or relocated stormwater drainage facilities elsewhere. As such, cumulative impacts to stormwater drainage would be less than significant.

## Solid Waste

Planned, pending, and reasonably foreseeable future development in the Frank R. Bowerman Landfill watershed would result in increased solid waste generation. As discussed in detail under Impact U-4, the Frank R. Bowerman Landfill is anticipated to reach its maximum permitted capacity in 2053 (CalRecycle 2019b) and has a maximum permitted daily throughput of 11,500 tons per day. This equates to an annual maximum throughput of approximately 4,197,500 tons per year. All Once operational, the Campus Master Plan would account for less than 0.1 percent of this annual throughput. In addition, compliance with applicable solid waste regulations would maintain or improve upon solid waste diversion rates. As per the CSU Sustainability Policy, CSUF must achieve an 80 percent reduce waste diversion rate by the year 2020 and continue toward zero waste by 2040. This would effectively result in a decrease in the total amount of CSUF related solid waste, including that associated with the Campus Master Plan disposed of at landfills in the short-term, and no contribution to landfill volumes in the long term. Cumulative development in the region outside the CSUF campus, as listed in Table 5-2, would result in additional increases in solid waste generation and these projects would be subject to local solid waste diversion programs and requirements. For example, AB 939 requires cities to divert 50 percent of solid waste from landfills. Given the nominal fraction of annual throughput accounted for by the Campus Master Plan and local, regional, and statewide efforts to improve solid waste diversion rates, cumulative impacts to solid waste facilities would be less than significant.

## Electric Power and Natural Gas Facilities

As noted in Section 4.12, *Utilities and Service Systems*, CSUF is serviced by SCE and SCG. As development within an area occurs, such as the projects listed in Table 5-2, these service providers typically incorporate their development into their assessment of infrastructure. Development under the Campus Master Plan, in combination with projects listed in Table 5-2, would result in an increase in electrical, and natural gas demands. However, during service provider assessments, utility providers periodically consider the need to purchase more resources and upgrade/expand infrastructure. In addition, CSUF is working towards increasing self-generated energy by exploring options such as investing in battery energy storage. With inclusion of relevant mitigation measures and compliance to state and federal laws, effects from infrastructure improvements would be less than significant.

## Telecommunication

The Campus Master Plan does not include any major telecommunications improvements. Minor telecommunications improvements, such as undergrounding of telephone lines or rewiring of existing buildings may occur as part of individual projects under the Campus Master Plan or cumulative development projects. However, cumulative projects would each be required to provide adequate telecommunications infrastructure upgrades and would be subject to the appropriate level of environmental review. As with the Campus Master Plan, such upgrades would typically be expected to occur within the development footprints of other cumulative projects. Therefore, cumulative impacts related to telecommunications infrastructure would be less than significant.

## 6 Other CEQA Required Discussions

---

This section discusses growth-inducing impacts and irreversible environmental impacts resulting from the Campus Master Plan.

### 6.1 Growth Inducement

Section 15126(d) of the CEQA Guidelines requires a discussion of a proposed project's potential to foster economic or population growth, including ways in which a project could remove an obstacle to growth. Growth does not necessarily create significant physical changes to the environment. However, depending upon the type, magnitude, and location of growth, it can result in significant adverse environmental effects. The Campus Master Plan's growth inducing potential is therefore considered significant if project-induced growth could result in significant physical effects in one or more environmental issue areas.

#### 6.1.1 Population Growth

As discussed in Section 4.8, *Population and Housing*, the surrounding region is anticipated to increase by approximately 80,100 residents between 2020 and 2040. The City of Fullerton is anticipated to grow by approximately 14,800 residents between 2020 and 2040. Existing and projected city populations were taken from SCAG, growth forecasts (2016). Table 4.8-2 summarizes anticipated population growth for the City of Fullerton and surrounding cities.

As discussed in Section 4.8, *Population and Housing*, the Campus Master Plan would accommodate the planned incremental increase of 7,000 FTES and 1,000 faculty/staff by 2040. To accommodate this increase, the Campus Master Plan would direct the development of additional on-campus student and faculty/staff housing which would reduce the need for students, faculty and staff to seek off-campus housing. Additionally, the increase of 7,000 FTES is included in the SCAG population forecasts for the region and City of Fullerton. Therefore, the Campus Master Plan would not generate unplanned population growth in the City of Fullerton and the region.

With respect to employment growth, the Campus Master Plan would accommodate the planned increase of approximately 1,000 faculty/staff; partially through the development of on-campus housing for 350 faculty/staff and their families. Other faculty/staff can be accommodated by the existing and planned housing stock in the City of Fullerton and surrounding communities. Given the above considerations, the Campus Master Plan would not generate a need for construction of new off-campus housing beyond what is already anticipated in the SCAG city and regional forecasts.

The Campus Master Plan would not involve the extension of roads and utility infrastructure as no new development is proposed outside of the existing campus footprint. As discussed in Section 4.9, *Public Services*, Section 4.10, *Recreation*, Section 4.12, *Utilities and Service Systems*, development of the Campus Master Plan would not result in the need for new or expanded infrastructure related to police or fire protection services, schools, parks, libraries, medical services, water or wastewater treatment service, solid waste disposal, or other utility systems due to population growth. As a result, population growth resulting from the Campus Master Plan would not result in significant physical impacts due to potential increase in public services or the use of public infrastructure.

## 6.1.2 Economic Growth

Implementation of the Campus Master Plan would generate temporary employment opportunities during construction of individual buildings and projects. Because construction workers would be expected to be drawn from the existing regional work force, construction of the Campus Master Plan would not be considered growth-inducing. However, the Campus Master Plan would add long-term employment opportunities in the region associated with growth and operation of the CSUF campus. Table 6-1 shows the potential increase in employment.

**Table 6-1 Employment Increase Resulting from the Campus Master Plan**

Commercial Land Use	Amount	Employment Density	Total
<b>Campus Master Plan</b>			
Government Office <sup>3</sup>	115.6 acre <sup>1</sup>	48.9 employees/acre <sup>2</sup>	5,653 <sup>4</sup>
Subtotal			5,653

<sup>1</sup> The Campus Master Plan has an added square feet value of 5,044,111 sf. The added acreage was found converting the proposed square feet into acres.

<sup>2</sup> SCAG Employment Density Study, 2001, Table 3, Orange County, file:///C:/Users/bweatherby/Downloads/SCAG%20Employment%20Density%20Report.pdf

<sup>3</sup> The City of Fullerton designates CSUF as a Public-Land use (P-L). Therefore, acreage values were taken from SCAG’s public land use category. SCAG does not include a sub land use category for university of educational institution. Government office will be used in lieu of no educational sub land use category.

<sup>4</sup> Total has been rounded up to nearest whole number.

Note: 43,650 square feet = 1 acre

The proposed added square feet as a result of the Campus Master Plan would be approximately 5,044,111. To obtain the proposed acreage of the Campus Master Plan, square feet was converted into acres. One acre equates to 43,560 square feet, thus resulting in a total acreage of 115.6 acres. The City of Fullerton designates CSUF as a Public-Land use (P-L). To find the number of employees per acre, values were obtained using SCAG’s General Plan Employment Density Report for Orange County, under the land use category of Public Land. Additionally, no sub-category of educational institution was included in SCAG’s report. Therefore, values were pulled from Government Office under the Public Land category.

As discussed in Section 4.8, *Population and Housing*, the Campus Master Plan would not be expected to induce substantial economic expansion to the extent that direct physical environmental effects would result as the anticipated employment growth is anticipated in regional forecasts. Buildout of the Campus Master Plan is expected to contribute heavily to the City’s economy and be a large source of employment to the City and the surrounding region. SCAG forecasts that 16,100 jobs will be added in Fullerton between 2020 and 2040 (SCAG, 2016). The jobs anticipated by the Campus Master Plan would account for approximately 35 percent of job growth between 2020 and 2040 and, therefore, would be well within employment forecasts.

## 6.1.3 Removal of Obstacles to Growth

The Campus Master Plan would be implemented within the existing campus boundaries which contain established land uses and supporting infrastructure (roads, water distribution, wastewater and drainage collection, and energy distribution). The Campus Master Plan includes redevelopment

of campus buildings and facilities and would intensify existing land use. To account for this intensification, the Campus Master Plan proposes circulation infrastructure improvements, to provide for the safe and efficient movement of pedestrians, bicycles, and vehicles around campus, while also encouraging transitions to active transportation. Further, utilities infrastructure improvements, such as minor improvements to water, wastewater, and storm drainage infrastructure, are proposed to accommodate growth under the Campus Master Plan. No new roads would be required. Because the Campus Master Plan constitutes redevelopment within an urbanized area and does not require the extension of new infrastructure through undeveloped areas, implementation of the Campus Master Plan would not remove an obstacle to growth.

## 6.2 Significant and Unavoidable Adverse Impacts

The CEQA Guidelines Section 15126.2(b) requires EIRs to include a discussion of the significant environmental effects that cannot be avoided if the Campus Master Plan is implemented. As documented in Section 5, *Cumulative Impacts*, after implementation of the recommended mitigation measures, most of the impacts associated with the Campus Master Plan would be reduced to a less-than-significant level. The following impacts are considered significant and unavoidable; that is, no feasible mitigation is available to reduce these impacts to a less-than-significant level:

- Impact 4.2-1 Conflict with or obstruct implementation of the applicable air quality plan
- Impact 4.2-2 Result in a cumulatively considerable net increase of any criteria pollutant for which the region is non-attainment under an applicable federal or state ambient air quality standard
- Impact 4.3.1 Cause a substantial adverse change in the significance of a historical resource pursuant to Section 15064.5
- Impact 4.5-1 Generate GHG emissions, directly or indirectly, that may have a significant impact on the environment
- Impact 4.5-2 Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHG emissions

Cumulative impacts to air quality (criteria air pollutant emissions during operations), cultural resources (impacts to historical resources) and GHG emissions (effects during construction and operation, conflicts with EO B-55-18 and ACUPCC) would be significant and unavoidable as a result of the implementation of the Campus Master Plan.

## 6.3 Significant and Irreversible Environmental Changes

The CEQA Guidelines requires a discussion of any significant irreversible environmental changes that would be caused by a project. Specifically, the CEQA Guidelines Section 15126.2(d) states:

Uses of nonrenewable resources during the initial and continued phases of the project may be irreversible, since a large commitment of such resources makes removal or nonuse thereafter unlikely. Primary impacts and, particularly, secondary impacts (such as highway improvement which provides access to a previously inaccessible area) generally commit future generations to similar uses. Also, irreversible damage can result from environmental accidents associated with the project. Irrecoverable commitments of resources should be evaluated to assure that such current consumption is justified.

Generally, a project would result in significant irreversible environmental changes if one the following would occur:

- The primary and secondary impacts would generally commit future generations to similar uses
- A project would involve uses in which irreversible damage could result from any potential environmental accidents associated with the project
- A project would involve a large commitment of nonrenewable resources
- Proposed consumption of resources is not justified (e.g., a project involves the wasteful use of energy)

CSUF's ownership of the campus represents a long term-commitment of the campus and education uses and implementation of the Campus Master Plan would continue these uses. Restoration of the campus to pre-developed conditions would not be feasible given the degree of disturbance, the urbanization of the area, and the level of capital investment.

Irreversible commitments to future use include those related to new housing or academic and administrative space. Resources that would be permanently and continually consumed by Campus Master Plan implementation include water, electricity, natural gas, and fossil fuels. However, all new buildings would be construction in accordance with the most recent building code (i.e., CBC) at the time of construction, which require measures to reduce energy use and GHG emissions. Additionally, CSUF policies and initiatives to use renewable energy, environmentally conscious design and materials, and measures to enhance pedestrian and bicycle use, would further reduce environmental impacts. However, construction and operational activities would still result in the irretrievable commitment of nonrenewable energy resources, primarily in the form of fossil fuels, natural gas, and gasoline for automobiles and construction equipment.

In respect to operational activities, compliance with and exceedance of applicable building codes, along with mitigation measures, would ensure that natural resources are conserved or recycle to the maximum extent feasible. Additionally, new technologies or systems would emerge, or become more cost-effective or user-friendly, which would further reduce CSUF reliance on nonrenewable natural resources.

Implementation of the Campus Master Plan would accommodate student and employee population growth. Environmental impacts of on-campus population growth are accounted for in the Campus Master Plan and considered in this EIR. However, because the Campus Master Plan would cumulatively contribute to the region's housing supply, it would reduce the off-campus population growth in surrounding jurisdictions. Additionally, because the Campus Master Plan includes on-campus workforce housing, the Campus Master Plan would decrease demand for off-campus housing in the region. Therefore, the Campus Master Plan would not result in adverse impacts beyond those inherent to the plan itself and applicable plans and forecasts.

# 7 Alternatives

---

## Introduction

7.1 CEQA requires an EIR to describe a reasonable range of alternatives to a project or to the location of a project that feasibly attains most of the project's basic objectives but avoids or substantially lessens any of the project's significant environmental impacts. CEQA also requires an EIR to evaluate the comparative merits of the alternatives. Section 15126.6(a), of the CEQA Guidelines requires EIRs to describe:

a range of reasonable alternatives to the project, or to the location of the project, which would feasibly attain most of the basic objectives of the project but would avoid or substantially lessen any of the significant effects of the project and evaluate the comparative merits of the alternatives. An EIR need not consider every conceivable alternative to a project. Rather, it must consider a range of potentially feasible alternatives that will foster informed decision making and public participation. An EIR is not required to consider alternatives that are infeasible. The lead agency is responsible for selecting a range of project alternatives for examination and must publicly disclose its reasoning for selecting those alternatives. There is no ironclad rule governing the nature or scope of the alternatives to be discussed other than the rule of reason.

This section of the CEQA Guidelines also provides guidance regarding what the alternatives analysis should consider. CEQA Guidelines Section 15126.6(b) further states the purpose of the alternatives analysis is as follows:

Because an EIR must identify ways to mitigate or avoid the significant effects that a project may have on the environment (Public Resources Code Section 21002.1), the discussion of alternatives shall focus on alternatives to the project or its location which are capable of avoiding or substantially lessening any significant effects of the project, even if these alternatives would impede to some degree the attainment of the project objectives, or would be more costly.

The CEQA Guidelines require that the EIR include sufficient information about each alternative to allow meaningful evaluation, analysis, and comparison with the proposed project. If an alternative would cause one or more significant effects in addition to those that would be caused by the project as proposed, the significant effects of the alternative must be discussed, but in less detail than the significant effects of the project as proposed (CEQA Guidelines Section 15126.6(d)).

The CEQA Guidelines further require that the "no project" alternative be considered (CEQA Guidelines Section 15126.6(e)). The purpose of describing and analyzing a no project alternative is to allow decision makers to compare the impacts of approving a proposed project with the impacts of not approving the proposed project. If the no project alternative is the environmentally superior alternative, CEQA requires that the EIR "shall also identify an environmentally superior alternative among the other alternatives" (CEQA Guidelines Section 15126.6(e)(2)). In defining "feasibility" (e.g., feasibly attain most of the basic objectives of the project), CEQA Guidelines Section 15126.6(f)(1) states, in part: Among the factors that may be taken into account when addressing the feasibility of alternatives are site suitability, economic viability, availability of infrastructure, general plan consistency, other plans or regulatory limitations, jurisdictional boundaries (projects with a regionally significant impact should consider the regional context), and

whether the proponent can reasonably acquire, control or otherwise have access to the alternative site (or the site is already owned by the proponent). No one of these factors establishes a fixed limit on the scope of reasonable alternatives. In determining what alternatives should be considered in the EIR, it is important to consider the objectives of the project, the project's significant effects, and unique project considerations. These factors are crucial to the development of alternatives that meet the criteria specified in CEQA Guidelines Section 15126.6(a).

## Consideration of Selection of Alternatives

### 7.2.1 Attainment of Project Objectives

7.2 In determining what alternatives should be considered in the EIR, the objectives of a project must be considered, as attainment of most of the basic objectives forms one of the tests of whether an alternative is feasible (see discussion above). CSUF identified the following objectives, as previously described (see Chapter 2, *Project Description*):

- Enable the university to accommodate incremental planned enrollment growth in the future as required by the CSU.
- Construct new academic facilities that can house programs to fulfill the pedagogic needs of the future and contribute to meeting demand created by planned enrollment growth.
- Improve the connectivity and cohesion of physical spaces on campus and with improved linkages to Downtown Fullerton and public transit.
- Enable the campus to function as a 24-hour hub for student life through increased building density with amenities and access to goods and services in the campus core, the addition of student beds, informal and after-hours work spaces for students, and improved nighttime security.
- Restore the Green Loop that circumnavigates the campus to better function as an organizing feature for academic facilities and open space.
- Increase the density of academic facilities in the campus core to support program growth and change and enable cross-disciplinary collaboration in a space-efficient manner.
- Develop an Innovation Hub that allows students to experiment with processes and prototypes for the future, to serve all sectors of society.
- Establish an event center on campus for daily use by the entire campus community.
- As the campus resumes primary responsibility for management of the Arboretum, balance preservation of its natural and historic resources, protection of its function as a place of solitude and reflection for campus and community members, and enhancement of its use for academic purposes.
- Provide an additional 2,400 student beds and a range of residential options and associated amenities on campus, to support improved rates of retention and graduation for freshman and other students.
- Provide 350 units of faculty housing.
- Improve alternative, multimodal access to campus and reduce reliance on personal vehicle use and parking demand.
- Replace and improve storm management infrastructure to reduce the incidence of flooding.

- Incorporate resilience into the Campus Master Plan through emergency management planning and established locations for emergency operation centers and material storage.

## 7.2.2 Summary of Campus Master Plan Impacts

As required under CEQA, the intent of this alternatives analysis is to consider options that could reduce the Campus Master Plan’s significant impacts. As presented in prior sections of this EIR, the Campus Master Plan would result in significant and unavoidable impacts with respect to air quality and GHG emissions. Please see the Executive Summary for a summary of the significant and unavoidable impact determinations in these environmental resource areas. As stated therein, implementation of the Campus Master Plan was determined to result in significant and unavoidable impacts on air quality (construction- and operations-related exceedance of SCAQMD thresholds for ozone precursors); cultural resources (historic built environment resources); and GHG emissions (exceedance of applicable emissions thresholds, conflict with applicable GHG emission plans). Implementation of the Campus Master Plan was also determined to result in significant but mitigable impacts on cultural resources (archaeological resources); geology and soils, including paleontological resources; and noise (construction).

## Alternatives Considered but Not Evaluated Further

### 7.3

As described above, CEQA Guidelines Section 15126.6(c) provides that the range of potential alternatives for the project shall include those that could feasibly accomplish most of the basic objectives of the project and could avoid or substantially lessen one or more of the significant effects. Alternatives that fail to meet the fundamental project purpose need not be addressed in detail in an EIR.

An EIR is also required to identify any alternatives that were considered by the lead agency but were rejected during the planning or scoping process, and briefly explain the reasons underlying the lead agency’s determination. The following alternatives were considered by CSUF but are not evaluated further in this EIR, for the reasons discussed:

- **Limited Student Enrollment:** Under this alternative, CSUF would limit student enrollment on campus resulting in a reduced need for development. This could result in reduced environmental impacts compared to the Campus Master Plan, as it would reduce the amount of new facilities development, renovations of existing buildings, and construction of landscaping/hardscape improvements. However, this alternative as it would not allow CSUF to accommodate future enrollment growth in fulfillment of the CSU’s core mission, achieve the underlying purpose of the Campus Master Plan, or achieve any of the objectives.
- **No Additional Arboretum Development.** As discussed in Chapter 2, *Project Description*, and Section 4.10, *Recreation*, since 1976 the Arboretum has been operated under the auspices of the Arboretum Authority, a Joint Exercise Powers Agreement (JPA) between the Redevelopment Agency of the City of Fullerton and the Trustees of the CSU. Located in the northeastern corner of the campus, the Arboretum encompasses 26 acres and contains four major plant collections (Cultivated, Woodlands, Mediterranean, and Desert) including potentially historic citrus and avocado tree plantings; a visitor center with classrooms, museum, pavilion, and other facilities; Heritage House (Dr. George C. Clark Home and Office); a plant nursery; and a garden sale area. It serves as a campus research and education facility and as a regional destination. Since 1977, the University has leased the Arboretum land to the Authority, which has been responsible for the plant collections and historic buildings.

The Arboretum holds a Level IV ArbNet accreditation for its contribution to research and conservation projects, one of only 21 arboreta in the world to hold this distinction. As discussed in detail in Section 3.4, *Recreation*, the Arboretum is required to employ scientists engaged in research, manage living tree collections for conservation purposes, and take an active role in supporting tree conservation through professional affiliations and leadership. CSUF students conduct biological and agricultural research focusing on sustainable food systems and food justice in the arboretum. Students and Arboretum staff also mentor and teach K-12 students, other college students, and community members in the “living laboratory” of the Arboretum through a free curriculum-based outdoor science program and fee-based classes for students and the community.

With the State’s elimination of Community Redevelopment Agencies, the Arboretum Authority JPA is set to terminate in December 2020. At that time, the responsibility for management and operation of the Arboretum will fall solely to CSUF, which plans to administer it through the CSUF Extension and International Programs. Arboretum administration will entail additional costs for the university for its staff, programs, the maintenance and cultivation of the grounds and plant collections, irrigation, and other expenses. The anticipated increase in student enrollment, faculty, and staff at CSUF is expected to increase demand for use of the Arboretum, as the result of an increase in annual visitors, events, and educational and research activities.

As stated in Section 3.4, *Recreation*, the Campus Master Plan proposes upgrades of existing Arboretum facilities and new development within the Arboretum that supports its mission, protect its assets, and allows it to be self-sustaining. Absent the existence and support of the JPA beyond December 2020, the University’s assumption of operation of the Arboretum will impose an unsustainable cost burden. Without the Campus Master Plan improvements, the Arboretum would not be able to support the academic and community programming it currently offers and proposes for the future. Accordingly, this alternative would not achieve the objective related to the Arboretum, which states, “As the campus resumes primary responsibility for management of the Arboretum, balance preservation of its natural and historic resources, protection of its function as a place of solitude and reflection for campus and community members, and enhancement of its use for academic purposes.” For these reasons, an alternative that eliminates future new development of educational, interpretive, and other support facilities in the Arboretum was dismissed from

7.4 further detailed evaluation in the alternatives section.

## Alternatives Selected for Detailed Analysis

Based on the significant environmental impacts and the objectives established for the Campus Master Plan, the following alternatives have been selected for analysis:

- **No Project-No Development Alternative:** Under the No Project-No Development Alternative, future campus development would generally be limited to projects already approved under the adopted 2003 Master Plan, which includes a very limited number of academic facilities, some support facilities, a single student residence, and a parking structure. Student enrollment, which reached its approved cap of 25,000 FTES during the 2016-2017 academic year, would remain officially capped at that level, despite ongoing increases in demand. Any additional development would be required to undergo separate environmental review; campuses are limited to one major master plan revision per year by the CSU State University Administrative Manual “when warranted by emergency or when donor-sponsored capital projects require earlier consideration.” This alternative was selected for evaluation as required under CEQA for

its ability to reduce the Campus Master Plan's significant and unavoidable impacts related to Air Quality, Cultural Resources (Historic Resources), and Noise.

- **Reduced Enrollment and Academic Space Alternative:** Under this alternative, the same components would be constructed as under the Campus Master Plan, including academic, staff/faculty residential, student residential and student life, and athletic and recreational facilities, but there would be a 25 percent reduction in the square footage of academic space constructed. This alternative was selected for evaluation for its potential to reduce the Campus Master Plan's significant and unavoidable impacts related to air quality, GHG emissions, cultural resources (historic resources), and noise through a reduction in new development, while still meeting a majority of project objectives.
- **Increased Student Housing Alternative:** Under this alternative, the same components would be constructed as under the Campus Master Plan, including academic, faculty/staff residential, student life, and athletic and recreational facilities. However, the number of new student beds would be increased from 3,000 beds to 6,000 beds in order to reduce VMT, allow more students to reside on campus and access non-academic activities and programs, and further activate the 24/7 campus environment. To accommodate this number of student beds, up to three new student housing clusters each comprising multiple buildings would be constructed. This alternative was selected for evaluation for its potential to reduce the Campus Master Plan's significant and unavoidable impacts related to air quality and GHG emissions and further reduce VMT while still meeting a majority of project objectives, including the objectives related to the provision of additional student housing and an activated 24/47 campus environment.

The environmental impacts of each alternative are analyzed in Sections 7.4.1 through 7.4.3, below.

### 7.4.1 Alternative 1: No Project Alternative

CEQA Guidelines Section 15126.6(e)(1) requires that the "no project" alternative be described and analyzed "to allow decision makers to compare the impacts of approving the project with the impacts of not approving the project." The no project analysis is required to discuss "the existing conditions at the time the notice of preparation is published...as well as what would be reasonably expected to occur in the foreseeable future if the project were not approved, based on current plans and consistent with available infrastructure and community services" (CEQA Guidelines Section 15126.6(e)(2)). "If the project is...a development project on identifiable property, the no project alternative is the circumstance under which the project does not proceed. Here the discussion would compare the environmental effects of the property remaining in its existing state against environmental effects which would occur if the project is approved. If disapproval of the project under consideration would result in predictable actions by others, such as the proposal of some other project, this 'no project' consequence should be discussed. In certain instances, the no project alternative means 'no build' wherein the existing environmental setting is maintained. However, where failure to proceed with the project will not result in preservation of existing environmental conditions, the analysis should identify the practical result of the project's non-approval and not create and analyze a set of artificial assumptions that would be required to preserve the existing physical environment" (CEQA Guidelines Section 15126(e)(3)(B)).

CSUF's current Campus Master Plan was approved in 2003, making it outdated and inadequate for the university's growing demand. Since the 2003 Master Plan was approved, CSUF has become the second largest university within the CSU system and has experienced considerable growth in FTES numbers. While the 2003 Master Plan is outdated, this alternative is designed to comply with CEQA

Guidelines Section 15162(e)(3)(A) requirements to disclose the anticipated environmental impacts which would occur under a continuation of the 2003 Master Plan.

Under the No Project Alternative, the Campus Master Plan would not be adopted; rather, development of the campus would proceed in accordance with the 2003 Master Plan. Campus improvements proposed under the 2003 Master Plan but not yet constructed would still be implemented within campus boundaries (including the main campus as well as portions of the campus north of Yorba Linda Boulevard, south of East Nutwood Avenue, and west of North State College Boulevard. There are several facilities that were either already under construction at the time that the 2003 Master Plan was being prepared or were constructed between 2004 and 2019. These include the Mihaylo Colleges of Business and Economics, the Student Recreation Center, the University Police and Emergency Operations Center, and three new parking structures. With completion of these facilities, most of the facilities and improvements approved under the 2003 Master Plan will have been implemented.

Under the No Project Alternative, it is assumed that remaining facilities approved under the 2003 Master Plan that have not yet been constructed would be implemented as shown in the Campus Master Plan. Major facilities not yet constructed include the Ruby Gerontology expansion, the bookstore expansion, additional student housing, retail service office, the retail/office development on Nutwood Avenue, and the staff/ faculty housing complex and parking structure south of Nutwood Avenue.

## **Aesthetics**

A very limited amount of development, as well as some improvements to circulation and landscaped areas, would occur under the No Project Alternative. During construction, short-term visual changes would occur due to the presence and storage of construction material and equipment in staging areas, albeit to a far lesser degree than under the Campus Master Plan. Because much of the campus is already developed, remaining buildout of the 2003 Master Plan would not substantially alter any existing views or the character of the campus.

Because the 2003 Master Plan is largely built out, the No Project Alternative would result in almost no new academic space, no staff/faculty housing, greatly reduced student housing and support space, and no new athletic and recreational facilities, and would therefore reduce potential impacts related to obstruction of the key views to and from the campus. The reduced amount of new development would also correspondingly reduce visual impacts related to light and glare, although those impacts were determined to be less than significant under the Campus Master Plan. As such, overall aesthetic impacts would be slightly reduced compared to the Campus Master Plan and would similarly result in less than significant impacts. (*Less impact*)

## **Air Quality**

Air quality impacts under the No Project Alternative would be less than those for the Campus Master Plan since only those facilities already approved under the 2003 Master Plan and not yet constructed would be developed. As a result of the reduction in the square footage of development under the No Project Alternative, construction-related emissions would decrease as compared to the Campus Master Plan.

With respect to operations, the No Project Alternative would result in a net decrease in operational emissions compared to the Campus Master Plan, because the overall development intensity would be substantially less than under the Campus Master Plan and enrollment would remain at or near

the official 25,000 FTES cap established by the 2003 Master Plan. Therefore, the No Project Alternative would not construct the additional academic space, innovation hub, event center, parking structures, and student or staff/faculty housing planned under the Campus Master Plan and would not generate the associated additional trips and VMT than the Campus Master Plan would. *(Less construction-related and operational impacts)*

## Cultural Resources

Since the 2003 Master Plan or No Project Alternative has been substantially built out and very little new development or renovation of existing facilities could occur, few or no impacts to historical resources would occur under this alternative. As discussed in Section 4.3, *Cultural Resources*, 10 properties within the campus were found to be eligible for the NRHP and CRHR, and another three properties were found eligible for the CRHR (a total of 13 buildings). Impacts to these 13 buildings were determined to be significant and unavoidable under the Campus Master Plan. Therefore, impacts associated with the No Project Alternative would be less than those of the Campus Master Plan.

With respect to archaeological resources, the reduced amount of development under the No Project Alternative would incrementally decrease the potential for impacts to unknown subsurface cultural resources. Thus, impacts would be reduced as compared to the Campus Master Plan, although the potential for impacts that require mitigation would remain. *(Less impact)*

## Energy

While planned new buildings under the Campus Master Plan would be designed with the goal of zero net energy consumption to the maximum extent feasible, and building renovations would include improvements to energy systems and efficiency, energy consumption associated with operation of the Campus Master Plan would nonetheless be greater than under the No Project Alternative. Accordingly, energy use under the No Project Alternative would be reduced compared to that of the Campus Master Plan due to the reduction in the amount of net new development that could take place. *(Less impact)*

## Greenhouse Gas Emissions

With the reduction in the square footage of development under the No Project Alternative, construction-related emissions would decrease compared to those of the Campus Master Plan.

A number of sustainability measures would be incorporated into new development under the Campus Master Plan, and the student and staff/faculty housing would be constructed that would reduce VMT and associated GHG emissions. Nonetheless, because only those facilities already approved under the 2003 Master Plan and not yet constructed would be developed under the No Project Alternative, the No Project Alternative would result in comparatively decreased operational GHG emissions compared to the Campus Master Plan. *(Less impact)*

## Noise

The No Project Alternative would result in a reduced amount of new development and correspondingly reduced construction activity, and associated construction noise would therefore be reduced compared to the Campus Master Plan.

With respect to operational noise, the reduced number of new facilities, including buildings, athletics and recreational facilities, student and staff/faculty housing, and parking facilities would

result in reduced operational noise compared to the Campus Master Plan. Moreover, since campus enrollment would remain capped at or near the approved 25,000 FTES, noise associated with campus-related traffic would be less than that of the Campus Master Plan, notwithstanding that the Campus Master Plan proposes to construction new student and staff/faculty housing that would reduce VMT. (*Similar construction-related impact; slightly greater operational impact*)

## Population and Housing

While planned new buildings under the Campus Master Plan would be designed with the goal of zero net energy consumption to the maximum extent feasible, and building renovations would include improvements to energy systems and efficiency, energy consumption associated with operation of the Campus Master Plan would nonetheless be greater than under the No Project Alternative. Accordingly, energy use under the No Project Alternative would be reduced compared to that of the Campus Master Plan due to the reduction in the amount of net new development that could take place. (*Less impact*)

## Public Services

As stated under Population and Housing, the No Project Alternative would cap enrollment on the CSUF campus, which would reduce the number of projected new residents in the City (students, staff, and faculty). Accordingly, demand for public services, including fire protection and emergency response services, police protection, public schools, libraries, and medical services, would be reduced compared to the Campus Master Plan, and no new or altered facilities would be required. Impacts would be less than significant and reduced compared to the Campus Master Plan. (*Less impact*)

## Recreation

The No Project Alternative would cap enrollment on the campus, and as a result, would not result in population growth in the City of Fullerton or surrounding cities or increase demand for public parks and recreational facilities in those cities. Impacts on public parks and recreational facilities would be less than significant. The Campus Master Plan would increase campus enrollment and thus the number of students, staff, and faculty living on campus and off-campus in the City of Fullerton and surrounding cities, some of whom would be expected to patronize public parks and recreational facilities in those cities. While this was determined to be a less than significant impact under the Campus Master Plan, impacts would be comparatively reduced under the No Project Alternative. (*Less impact*)

## Transportation and Traffic

As stated in Section 4.11, *Transportation* (Table 4.11-5), under existing conditions, the VMT for the CSUF campus is estimated to be 18.72 and the VMT for the Campus Master Plan is estimated to be comparatively lower – 14.38 -- as the result of the increase in student and staff/faculty housing on campus under the Campus Master Plan. For this reason, VMT impacts under the No Project Alternative, which would presumably be close to those of the existing campus, would be greater than VMT impacts of the Campus Master Plan.

Similar to the Campus Master Plan, the No Project Alternative would not result in any impacts relative to traffic hazards. Buildout of the campus under this alternative, including internal circulation, would comply with applicable safety standards and would not result in hazards due to geometric design features. Further, emergency access would not be adversely affected under this

alternative. Campus officials would ensure adequate emergency access is retained both during and after construction. Similar to the Campus Master Plan, impacts to emergency access would be less than significant under this alternative. (*Greater impact*)

### Utilities and Service Systems

Utilities and service systems were analyzed determined to be adequate for handling projected new demand for the Campus Master Plan. Since the No Project Alternative would mean campus enrollment would remain capped at or near the approved 25,000 FTES and only previously approved and not yet constructed development per the 2003 Master Plan could be constructed, impacts on utilities and service systems would be reduced compared to those of the Campus Master Plan. (*Less impact*)

### Relationship to Project Objectives

The No Project Alternative would not allow for any growth in campus enrollment or the development of any new facilities beyond those already approved under the 2003 Master Plan but not yet constructed. For this reason, it would not achieve the underlying purpose of the Campus Master Plan, which is to support the University's Academic Master Plan and the CSU's Graduation 2025 Initiative by guiding physical campus development through the year 2039 in ways that support anticipated enrollment growth and changes in pedagogy, academic and support programs, energy supplies and use, utility infrastructure, and transportation. It would also prevent achievement of any of the project objectives.

## 7.4.2 Alternative 2: Reduced Enrollment and Academic Space

Under the Reduced Enrollment and Academic Space Alternative, most aspects of the Campus Master Plan would still be implemented. The buildings proposed for renovation, such as McCarthy Hall, Langsdorf Hall, the Pollak Library, the Visual Arts complex, and the Humanities Social Sciences building, would still be renovated as under the Campus Master Plan. The new event center, mobility hubs, parking structures, new innovation center, proposed Arboretum improvements, and the four new student/faculty housing clusters would be implemented as proposed under the Campus Master Plan. However, academic space would be reduced, since academic space entitlement is driven by FTES enrollment, the FTES growth goal of 32,000 would also be reduced, as would and associated demand for student support space would also be reduced. Under this alternative, buildings A1 and A5 would not be constructed, which would reduce academic and student support space. The removal of these two buildings equates to the removal of 235,000 sf of academic space and 130,000 sf of student life space, for a total reduction of 365,000 sf, compared to the Campus Master Plan.

### Aesthetics

The Reduced Enrollment and Academic Space Alternative would result in a reduction of two buildings totaling 25 percent of proposed net new academic square footage compared to the Campus Master Plan. As discussed in Section 4.1, *Aesthetics*, the Campus Master Plan would have a less than significant impact with regard to aesthetic resources, including obstruction of views and light and glare generation. Implementation of the Reduced Enrollment and Academic Space Alternative would likewise be less than significant and would further reduce aesthetic impacts compared to the Campus Master Plan. (*Less impact*)

## Air Quality

The reduction in enrollment and academic square footage under the Reduced Enrollment and Academic Space Alternative would result in fewer emissions of the criteria pollutants associated with short-term construction and long-term operation. Construction and operation-related air quality impacts would still be significant and unavoidable, but reduced compared to the Campus Master Plan. Because this alternative would result in lower FTES as compared to the Campus Master Plan, overall traffic and VMT would be reduced and would be less than significant. *(Less construction-related and operational impacts; significant and unavoidable impacts remain)*

## Cultural Resources

As discussed in Section 4.3, *Cultural Resources*, 10 buildings on the campus were found to be eligible for the NRHP and CRHR, and another three properties were found eligible for the CRHR, for a total of 13 buildings. Impacts to historic resources would be comparable under this alternative, as the reduction in square footage would not reduce the potential for alterations to historic buildings compared to the Campus Master Plan, and impacts would therefore remain significant and unavoidable. *(Similar impact)*

With respect to archaeological resources, the incrementally reduced intensity and scale of development anticipated under the Reduced Enrollment and Academic Space Alternative, and thus the degree of ground disturbance, would incrementally reduce impacts compared to the Campus Master Plan, but the potential to encounter previously unknown resources would still exist. Impacts would be less than significant with mitigation, and slightly reduced compared to the Campus Master Plan. *(Less impact)*

## Energy

Under the Reduced Enrollment and Academic Space Alternative, the reduced scale of development would decrease the magnitude of construction activities and associated fuel use. Because building development for this alternative would be reduced as compared to the Campus Master Plan, energy consumption would likewise be reduced, although impacts would be less than significant under both scenarios. *(Less impact)*

## Greenhouse Gas Emissions

The reduction in square footage of academic facilities would result in fewer short-term construction GHG emissions. Similarly, due to the reduced intensity of academic square footage, long-term operational GHG emissions would be lower than under the Campus Master Plan. However, impacts would be significant and unavoidable under this alternative, as is the case for the Campus Master Plan, since the calculated annual emissions of MT CO<sub>2</sub>e would still exceed the 2039 threshold of 1.15 per service person. *(Less construction-related and operational impacts; significant and unavoidable impacts remain)*

## Noise

The reduction in academic square footage and reduced enrollment and associated VMT under the Reduced Enrollment and Academic Space Alternative would decrease construction and operational (mechanical and vehicular) noise generation compared to the Campus Master Plan. As under the Campus Master Plan, impacts would be less than significant for vehicular noise and significant, although mitigable, for construction and operational noise. *(Less impact)*

## Population and Housing

The Reduced Enrollment and Academic Space Alternative would result in a smaller amount of academic space and a reduction in FTES. However, similar to the Campus Master Plan, the Reduced Enrollment and Academic Space Alternative would not induce substantial population growth in the area or displace substantial numbers of existing housing or people; and impacts would be similar to the Campus Master Plan. (*Less impact*)

## Public Services

The Campus Master Plan was determined not to increase demand for fire or police protection services, schools, or other public facilities (libraries and medical facilities) such that new or physically altered governmental facilities, potentially causing significant environmental impacts in their own right, would be required to ensure the continued adequate provision of such services. As the Reduced Enrollment and Academic Space Alternative represents a reduction in student enrollment, impacts to public services would likewise be less than significant and would be reduced compared to the Campus Master Plan. (*Less impact*)

## Recreation

The Campus Master Plan was determined not to result in a significant increase in the use of neighborhood and regional parks or other recreational facilities, nor would it include or require the construction of such facilities, potentially causing significant environmental impacts in their own right, would be required to ensure the continued adequate provision of such services. As the Reduced Enrollment and Academic Space Alternative represents a reduction in student enrollment and a reduced need for academic space, impacts to on-campus facilities, including the Arboretum, and off-campus parks and recreational facilities would likewise be less than significant and would be reduced compared to the Campus Master Plan. (*Less impact*)

## Transportation and Traffic

The Reduced Enrollment and Academic Space Alternative would reduce academic space and FTES on the campus. As discussed in the Transportation Impact Assessment provided in Appendix M and discussed in Section 4.11, *Transportation*, the Campus Master Plan would operate at a VMT that is less than the established City benchmark. This is due to the VMT efficiency gained from housing a higher proportion of students, staff, and faculty on campus under proposed buildout than under existing conditions. Therefore, buildout under the Reduced Enrollment and Academic Space Alternative would result in reduced VMT compared to the Campus Master Plan, and impacts would be less than significant. (*Less impact*)

Similar to the Campus Master Plan, the Reduced Enrollment and Academic Space Alternative would result in less than significant impacts related to traffic hazards. Buildout of the campus under this alternative, including the design of internal circulation, would comply with state standards and would not result in hazards due to geometric design features. Further, emergency access would not be adversely affected under the Reduced Enrollment and Academic Space Alternative. Campus officials would coordinate with the State Fire Marshal to ensure adequate emergency access is retained during and after construction. Impacts to emergency access would therefore be less than significant under this alternative. Because the reduction in FTES and square footage would not measurably reduce impacts related to hazards and emergency access compared to the Campus

Master Plan's already less than significant impacts, impacts would be considered similar to those of the Campus Master Plan. (*Less impact*)

## Utilities and Service Systems

The reduction in FTES and developed square footage under the Reduced Enrollment and Academic Space Alternative would incrementally reduce demand for public utilities, including water supply and conveyance, wastewater conveyance and treatment, and solid waste disposal services, compared to the Campus Master Plan. Impacts would be less than significant, as was concluded for Campus Master Plan. (*Less impact*)

## Relationship to Project Objectives

The Reduced Enrollment and Academic Space Alternative would limit future enrollment growth on the campus as well as developed academic square footage, compared to the Campus Master Plan. For this reason, it would only partially achieve the underlying purpose of the Campus Master Plan, which is to support the University's Academic Master Plan and the CSU's Graduation 2025 Initiative by guiding physical campus development through the year 2039 in ways that support anticipated enrollment growth and changes in pedagogy, academic and support programs, energy supplies and use, utility infrastructure, and transportation.

This alternative would fully achieve the following nine project objectives, which would be unaffected by the reduction in enrollment growth and academic square footage:

- Restore the Green Loop that circumnavigates the campus to better function as an organizing feature for academic facilities and open space.
- Develop an Innovation Hub that allows students to experiment with processes and prototypes for the future, to serve all sectors of society.
- Establish an event center on campus for daily use by the entire campus community.
- As the campus resumes primary responsibility for management of the Arboretum, balance preservation of its natural and historic resources, protection of its function as a place of solitude and reflection for campus and community members, and enhancement of its use for academic purposes.
- Provide 350 units of faculty housing.
- Improve alternative, multimodal access to campus and reduce reliance on personal vehicle use and parking demand.
- Replace and improve storm management infrastructure to reduce the incidence of flooding.
- Incorporate resilience into the Campus Master Plan through emergency management planning and established locations for emergency operation centers and material storage.

The Reduced Enrollment and Academic Space Alternative would only partially achieve the following five project objectives, since the reduction in enrollment would result in the corresponding reduction in academic square footage on the campus, and an accompanying loss of capacity for future students:

- Enable the university to accommodate incremental planned enrollment growth in the future as required by the CSU.
- Construct new academic facilities that can house programs to fulfill the pedagogic needs of the future and contribute to meeting demand created by planned enrollment growth.

- Improve the connectivity and cohesion of physical spaces on campus and with improved linkages to Downtown Fullerton and public transit.
- Enable the campus to function as a 24-hour hub for student life through increased building density with amenities and access to goods and services in the campus core, the addition of student beds, informal and after-hours work spaces for students, and improved nighttime security.
- Increase the density of academic facilities in the campus core to support program growth and change and enable cross-disciplinary collaboration in a space-efficient manner.

### 7.4.3 Alternative 3: Increased Student Housing

The Increased Student Housing Alternative would be similar to the Campus Master Plan in all respects except that the number of new student beds would increase from 3,000 to 6,000, in new student residential buildings. The additional 3,000 beds would be provided in three new housing clusters in the same area of campus, on the east side, as existing and other new student housing proposed under the Campus Master Plan, in buildings similar in height to those (i.e., no more than 75 feet tall). The additional student housing proposed under this alternative would be located here for reasons of collocation with other existing and proposed student housing and support services and to avoid encroaching on the defined Academic Core proposed under the Campus Master Plan or athletic and open space. Because of the presence of SR 57 to the ~~west~~ east, it is conceivable that additional student housing in this part of campus could result in the elimination of the parking facility to the south or encroachment into the Arboretum to the north and west. The building cluster intended for staff and faculty housing would not change compared to the Campus Master Plan.

CSUF has a high percentage of students that commute to classes as opposed to living on campus (<10 percent). The increase in housing would increase the percentage of students living on campus from approximately 8 percent to 25 percent, even accounting for an increase in the FTES from 25,000 to 32,000.

#### Aesthetics

With an increase in student housing development under this alternative, the density of development on the east side of the campus would increase, resulting in some loss of open space, including potentially some Arboretum area. The increase in student housing complexes would also generate additional light and glare in this part of the campus. For these reasons, the Increased Student Housing Alternative would result in increased aesthetic impacts, although like the Campus Master Plan, impacts would remain less than significant. (*Greater impact*)

#### Air Quality

The Increased Student Housing Alternative would result in incrementally increased construction-related air quality impacts due to the increased number of student residential buildings. This alternative would also slightly increase operational emissions associated with operation of three additional new student housing clusters of buildings. However, this alternative would greatly reduce student commuter trips and VMT compared to the Campus Master Plan. Therefore, the overall result of this alternative would be increased construction-related impacts but decreased operational impacts due to the VMT efficiencies of fewer student commuter trips. Air quality impacts under this alternative would be similar to the Campus Master Plan and significant and unavoidable. However, air quality impacts associated with vehicular emissions would be reduced as compared to the

Campus Master Plan due to VMT efficiencies associated with fewer students commuting to campus. *(Greater construction-related impact; less operational impact; significant and unavoidable impacts remain)*

## Cultural Resources

As discussed in Section 4.3, *Cultural Resources*, 10 properties within the campus were found to be eligible for the NRHP and CRHR, and another three properties were found eligible for the CRHR (total of 13 buildings). Impacts to historical resources would be comparable under this alternative because the additional 3,000 student beds would be accommodated in student residential housing clusters on the east side of campus, collocated with other existing and proposed student housing, and would avoid the identified historically significant buildings in the Academic Core and elsewhere on the campus. Impacts on historic resources would be comparable to those of the Campus Master Plan. *(Similar impact)*

Archaeological resource impacts under the Increased Student Housing Alternative would be slightly greater than under the Campus Master Plan, because a larger area of campus would be subject to disturbance, and impacts would remain significant but mitigable. *(Greater impact)*

## Energy

Energy use associated with construction activities would be greater under the Increased Student Housing Alternative than under the Campus Master Plan due to the increase in construction activity required for the additional student housing. Operational energy demand would also be comparatively greater because of the increased residential square footage, although this would be partially offset by the reduction in energy use associated with reduced VMT. *(Greater impact)*

## Greenhouse Gas Emissions

Under the Increased Student Housing Alternative, a greater amount of student housing would be constructed than under the Campus Master Plan, resulting in increased short-term construction GHG emissions. The additional housing contemplated under this alternative would result in slightly increased operational GHG emissions relative to energy and water use and the production of solid waste; however, this would be partially or entirely offset by the Campus Master Plan's proposed sustainability measures. Moreover, this alternative would result in a slight reduction in GHG emissions compared to the Campus Master Plan due to the VMT efficiencies. However, both construction and operational GHG emissions under this alternative would be significant and unavoidable. *(Greater construction-related impact; less operational impact; significant and unavoidable impacts remain)*

## Noise

The increased student housing square footage under the Increased Student Housing Alternative would increase the magnitude of construction, and therefore of associated construction noise, compared to the Campus Master Plan, although those impacts were determined to be less than significant and would likewise be less than significant under this alternative.

However, the Increased Student Housing Alternative would result in a reduction in traffic noise levels due to the reduction in trips generated by commuters as compared to the Campus Master Plan, and the increase in operational noise associated with stationary (building mechanical) operation would be minor. Accordingly, operational noise impacts would be less than those of the

Campus Master Plan and less than significant. (*Greater construction-related impact; less operational impact*)

## Population and Housing

The Increased Student Housing Alternative would provide more housing opportunities on campus to meet existing and projected housing demands associated with enrollment growth than would be provided under the Campus Master Plan. Additionally, this growth would account for less than one percent of the total population by 2040 and would be consistent with SCAG growth projects. Neither the Campus Master Plan nor the Increased Student Beds Alternative would result in the permanent displacement or loss of housing. Nonetheless, this alternative would result in reduced impacts related to population and housing than the Campus Master Plan. (*Less impact*)

## Public Services

The Campus Master Plan was determined not to increase demand for fire or police protection services, schools, or other public facilities (libraries and medical facilities) such that new or physically altered governmental facilities, potentially causing significant environmental impacts in their own right, would be required to ensure the continued adequate provision of such services. As ~~W~~with the only significant difference being an increase in student housing on campus, impacts to public services under the Increased Student Housing Alternative would likewise be less than significant and would be reduced compared to the Campus Master Plan. (*Less impact*)

## Recreation

The Campus Master Plan was determined not to result in a significant increase in the use of neighborhood and regional parks or other recreational facilities, nor would it include or require the construction of such facilities, potentially causing significant environmental impacts in their own right, would be required to ensure the continued adequate provision of such services. As the Increased Student Housing Alternative represents only an increase in student housing on campus, a ~~reduction in student enrollment~~, impacts on off-campus parks and recreational facilities would likewise be less than significant and would be reduced compared to the Campus Master Plan. (*Less impact*)

## Transportation and Traffic

The addition of 3,000 more beds on campus under this alternative would result in reduced VMT compared to the Campus Master Plan, due to the reduction in student commuter trips. Therefore, while transportation and traffic impacts would be less than significant for both this alternative and the Campus Master Plan, buildout under the Increased Student Housing Alternative would result in fewer traffic impacts.

Similar to the Campus Master Plan, the Increased Student Housing Alternative would not result in any impacts relative to traffic hazards. Buildout of the campus under this alternative, including the designs of internal circulation, would comply with state standards and would not result in hazards due to geometric design features. Further, emergency access would not be adversely affected under the Increased Student Beds Alternative. Campus officials would coordinate with the State Fire Marshal to ensure adequate emergency access is retained both during and after construction. Similar to the Campus Master Plan, impacts to emergency access would be less than significant under this alternative. (*Less impact*)

## Utilities and Service Systems

The increase in student residential square footage under the Increased Student Housing Alternative would incrementally increase demand for public utilities, including water supply and conveyance, wastewater conveyance and treatment, and solid waste disposal services, compared to the Campus Master Plan. Impacts would remain less than significant, as was concluded for Campus Master Plan. (*Greater impact*)

## Relationship to Project Objectives

The Increased Student Housing Alternative would increase the amount of student housing on campus compared to the Campus Master Plan, and in all other respects would be identical to the Campus Master Plan. For this reason, this alternative would fully achieve the underlying purpose of the Campus Master Plan, which is to support the University's Academic Master Plan and the CSU's Graduation 2025 Initiative by guiding physical campus development through the year 2039 in ways that support anticipated enrollment growth and changes in pedagogy, academic and support programs, energy supplies and use, utility infrastructure, and transportation.

This alternative would fully achieve the following 13 project objectives, which would be unaffected by the reduction in enrollment growth and academic square footage:

- Enable the university to accommodate incremental planned enrollment growth in the future as required by the CSU.
- Construct new academic facilities that can house programs to fulfill the pedagogic needs of the future and contribute to meeting demand created by planned enrollment growth.
- Improve the connectivity and cohesion of physical spaces on campus and with improved linkages to Downtown Fullerton and public transit.
- Enable the campus to function as a 24-hour hub for student life through increased building density with amenities and access to goods and services in the campus core, the addition of student beds, informal and after-hours work spaces for students, and improved nighttime security.
- Restore the Green Loop that circumnavigates the campus to better function as an organizing feature for academic facilities and open space.
- Increase the density of academic facilities in the campus core to support program growth and change and enable cross-disciplinary collaboration in a space-efficient manner.
- Develop an Innovation Hub that allows students to experiment with processes and prototypes for the future, to serve all sectors of society.
- Establish an event center on campus for daily use by the entire campus community.
- Provide an additional ~~2,400~~3,000<sup>1</sup> student beds and a range of residential options and associated amenities on campus, to support improved rates of retention and graduation for freshman and other students.
- Provide 350 units of faculty housing.
- Improve alternative, multimodal access to campus and reduce reliance on personal vehicle use and parking demand.

---

<sup>1</sup> Approximately 600 of the proposed 3,000 student housing beds were evaluated under the 2003 Master Plan and are the subject of separate environmental review. These beds are included in this discussion as they have not yet been constructed and are a part of the projected 3,000 additional student beds accommodated under the Campus Master Plan.

- Replace and improve storm management infrastructure to reduce the incidence of flooding.
- Incorporate resilience into the Campus Master Plan through emergency management planning and established locations for emergency operation centers and material storage.

The Increased Student Housing ~~Reduced Enrollment and Academic Space~~ Alternative has the potential to enable only partial achievement of the following project objective related to the Arboretum, since the additional student housing complexes could conceivably require encroachment on Arboretum land because of other physical constraints to the east, west and south:

- As the campus resumes primary responsibility for management of the Arboretum, balance preservation of its natural and historic resources, protection of its function as a place of solitude and reflection for campus and community members, and enhancement of its use for academic purposes.

Additionally, construction of this amount of student housing could be infeasible for reasons of space constraints on campus, cost, or lack of demand, depending on market conditions within Fullerton and surrounding cities.

## Comparison of Alternatives

7.5

Table 7-1 indicates whether each alternative's environmental impact is greater than, less than, or similar to that of the Campus Master Plan for each of the issue areas studied.

**Table 7-1 Impact Comparison of Alternatives**

Issue	Campus Master Plan Impact Classification	Alternative 1: No Project	Alternative 2: Reduced Enrollment and Academic Space	Alternative 3: Increased Student Housing
Aesthetics	LTS	<	<	>
Air Quality	SU	< (construction) < (operational)	< (construction) < (operational)	> (construction) < (operational)
Cultural Resources	SM	<	= (historical) < (archeological)	= (historical) > (archaeological)
Energy	LTS	<	<	>
GHG	SU	< (construction) < (operational)	< (construction) < (operational)	< (construction) > (operational)
Noise	SM	= (construction) > (operational)	< (construction) < (operational)	< (construction) > (operational)
Population/Housing	LTS	<	<	<
Public Services	LTS	<	<	<
<u>Recreation</u>	<u>LTS</u>	≤	≤	≤
Transportation and Traffic	LTS	>	<	<
Utilities and Service Systems	SM	<	<	>

< Impacts would be less than the Campus Master Plan  
 > Impacts would be greater than the Campus Master Plan  
 = Similar level of impact to the Campus Master Plan  
 LTS – Less than Significant  
 SM – Significant but Mitigable  
 SU – Significant and Unavoidable

7.6

## Environmentally Superior Alternative

The CEQA Guidelines Section 15126.6 states that an EIR should identify the “environmentally superior” alternative. “If the environmentally superior alternative is the ‘no project’ alternative, the EIR shall also identify an environmentally superior alternative among the other alternatives.” As shown in the Executive Summary section of this EIR, there would be significant and unavoidable impacts associated with the Campus Master Plan. These impacts are related to air quality and GHG. Each of the evaluated action alternatives would result in lesser environmental impacts on some environmental resources and greater impacts on others compared to the Campus Master Plan. None of the action alternatives presented would reduce all of the impacts associated with the Campus Master Plan.

Alternative 1 (No Project-No Development), which would represent the least amount of development compared to existing conditions and thus, least potential physical environmental

impacts, would be considered the environmentally superior alternative. Because the No Project–No Development Alternative (described above in Section 5.4.1) would reduce the significant adverse impacts resulting from the construction and operation of new facilities under the Campus Master Plan, it is the environmentally superior alternative. As required by the CEQA Guidelines (Section 15126.6 [e][2]), because the environmentally superior alternative was identified as the No Project Alternative, another environmentally superior alternative must be identified among the other alternatives considered.

When considering objectives, the Campus Master Plan would best meet the purpose and need. In contrast, Alternative 1 would not provide additional housing to accommodate any growth in student enrollment. Alternative 2 would generally result in impacts that are less or equal to the Campus Master Plan but would not provide all of the additional academic facilities to meet the needs that would be generated by planned student population growth. Alternative 3 would reduce some impacts but because additional student housing would be provided, impacts to ~~transportation~~ aesthetics, air quality, cultural resources, energy, GHG, noise and utilities and service systems would be greater.

Alternatives 2 and 3 would result in various environmental effects, some of which would be greater than with implementation of the Campus Master Plan, some less, and some the same. However, on balance, the environmentally superior alternative would be Alternative 2. Impacts associated with Alternative 2 would be reduced for all issue areas as compared to the Campus Master Plan. However, both the Campus Master Plan and the Reduced Enrollment and Academic Alternative would result in long-term significant and unavoidable environmental impacts. Therefore, the environmental impact differences between these two alternatives are not substantial enough that one is clearly superior to the other.

## 8.2 List of Preparers

This EIR was prepared by the California State University Fullerton, with the assistance of Rincon Consultants, Inc. Consultant staff involved in the preparation of the EIR are listed below.

### **RINCON CONSULTANTS, INC.**

Deanna Hansen, Principal  
 Brenna Weatherby, MCP, Senior Program Manager  
 Lynette Leighton, MEM AICP, Senior Planner  
 Bill Vosti, MESM, Senior Planner  
 John Sisser, MESM, Associate Planner  
 Emily Green, Environmental Planner  
 Jason Montague, Environmental Planner  
 Jenna Shaw, Environmental Planner

## Notice of Preparation

To: \_\_\_\_\_ From: \_\_\_\_\_  
\_\_\_\_\_  
(Address) (Address)  
\_\_\_\_\_

**Subject: Notice of Preparation of a Draft Environmental Impact Report**

\_\_\_\_\_ will be the Lead Agency and will prepare an environmental impact report for the project identified below. We need to know the views of your agency as to the scope and content of the environmental information which is germane to your agency's statutory responsibilities in connection with the proposed project. Your agency will need to use the EIR prepared by our agency when considering your permit or other approval for the project.

The project description, location, and the potential environmental effects are contained in the attached materials. A copy of the Initial Study (  is  is not ) attached.

Due to the time limits mandated by State law, your response must be sent at the earliest possible date but not later than 30 days after receipt of this notice.

Please send your response to \_\_\_\_\_ at the address shown above. We will need the name for a contact person in your agency.

**Project Title:** \_\_\_\_\_

**Project Applicant, if any:** \_\_\_\_\_

Date \_\_\_\_\_ Signature \_\_\_\_\_

Title \_\_\_\_\_

Telephone \_\_\_\_\_

**Reference:** California Code of Regulations, Title 14, (CEQA Guidelines) Sections 15082(a), 15103, 15375.

SR 57; PM 17.941

Dear Mr. Zordilla

Thank you for including the California Department of Transportation (Caltrans) in the review of the Notice of Preparation (NOP) for a draft Environmental Impact Report (EIR) for the proposed Updated Campus Master Plan for California State University, Fullerton (CSUF). The mission of Caltrans is to provide a safe, sustainable, integrated and efficient transportation system to enhance California's economy and livability.

The project proposes an update to the Campus Master Plan components which includes: net new on-campus housing for up to 3,000 students, a 6,000-seat event center, recreational facility and student union upgrades, new facilities and programs to enhance the University's Fullerton Arboretum, reconfigured and potentially increased parking capacity, new transit mobility hubs, and the College Park pedestrian bridge access across Nutwood Avenue. The Campus Master Plan will accommodate up to 32,000 full-time equivalent students (FTES) through the year 2040, an increase from the previously approved enrollment level of 25,000 as of the 2016/2017 academic year. The new net addition of approximately 3,517,202 gross square feet (gsf) of additional on-campus facilities is proposed as part of the Updated Campus Master Plan.

The project site encompasses the main CSUF campus, generally bordered by State Route 57 (SR-57) on the east, North State College Boulevard on the west, Yorba Linda Boulevard on the north, and Nutwood Avenue on the south, as well as the University's College Park classroom building and parking facilities south of Nutwood Avenue, bordered by College Place on the south, Langsdorf Drive on the east, and North Commonwealth Avenue on the west. SR 57 is owned and operated by Caltrans. Caltrans is a responsible/commenting agency and has the following comments:

*"Provide a safe, sustainable, integrated and efficient transportation system  
to enhance California's economy and livability"*

### **Traffic Operations**

1. Refer to the Caltrans Guide for The Preparation of Traffic Impact Studies when writing the Traffic Impact Study Report. Once completed, the Traffic Impact Studies Report needs to be submitted to Caltrans for review.
2. Traffic Operations requests the use of the latest version of the Highway Capacity Manual (HCM 2016) methodologies when analyzing traffic impacts on State Transportation Facilities.
3. The use of either Synchro or HCS software is preferred. All input sheets, assumptions and volumes on State Facilities should be submitted to Caltrans for review and approval.
4. Traffic Operations request the analysis of the following freeway segment types (within the influence area of the project):
  - Merge/Diverge at On/Off Ramps
  - Weaving
  - Queuing and its effects at Off Ramps
  - Mainline
5. Traffic Operations requests that the following SR 57 intersections be included in the analysis (LOS, 95th percentile queue): Chapman Ave, Nutwood Ave, and Yorba Linda Blvd.

### **Transportation Planning**

1. Because the CMP supports multi-mobility, Caltrans recommends discussing existing and proposed Complete Streets facilities and improvements. Complete Streets facilities accommodate for all modes of transportation, including bicycles, pedestrians, transit, and vehicles. Including a discussion that integrates all modes of transportation ensures that students, faculty, and visitors can easily transition between different modes of transportation (e.g., first-/last-mile connections between transit and campus). Complete Streets facilities also encourage Active Transportation, promote regional connectivity, improve air quality, and reduce congestion, thus benefitting students, faculty, and nearby residents.

2. Caltrans recommends that a Complete Streets discussion include the City of Fullerton's Bicycle Master Plan (2012). This will ensure consistency between documents and facilities.
3. Caltrans also recommends the CMP consider the inclusion of amenities that help support these goals. Such amenities may include electric vehicle chargers, secure short and long-term bicycle parking, safe connections and wayfinding signage to existing regional bike trails, and transit shelters and lighting.
4. As new transportation technologies continue to emerge, Caltrans recognizes their potential to shift people's transportation behaviors. We recommend the Campus Master Plan include a discussion of micro-mobility and other new, emerging technologies, including but not limited to:
  - o Electric powered vehicles (cars, bicycles, scooters, skateboards, etc.)
  - o Transportation Network Companies (TNC)
  - o Delivery robots
  - o Shared-use mobility (bike share, car share, etc.)
  - o Autonomous vehicles

**Permits:**

- Any project work proposed in the vicinity of the State right of way will require an encroachment permit, and all environmental concerns must be adequately addressed. Please coordinate with Caltrans in order to meet the requirements for any work within or near State Right-of-Way. A fee may apply. If the cost of work within the State right of way is below one Million Dollars, the Encroachment Permit process will be handled by our Permits Branch; otherwise the permit should be authorized through the Caltrans's Project Development Department. When applying for Encroachment Permit, please incorporate all Environmental Documentation, SWPPP/ WPCP, NPDES, Hydraulic Calculations, R/W certification and all relevant design details including design exception approvals. For specific details for Encroachment Permits procedure, please refer to the Caltrans's Encroachment Permits Manual. The latest edition of the Manual is available on the web site:  
<http://www.dot.ca.gov/hq/traffops/developserv/permits/>

**Environmental:**

- Caltrans expects the proposed EIR to evaluate any temporary and permanent water quality impacts that the proposed Master Plan may have and if any discharges ultimately outfall to Caltrans Right of Way. Those discharges must meet the latest version of the Caltrans Statewide NPDES Storm Water Permit issued by the State Water Resources Control Board.

Please continue to coordinate with Caltrans for any future developments that could potentially impact State transportation facilities. If you have any questions, please do not hesitate to contact Julie Lugaro at 657-328-6368 or [Julie.lugaro@dot.ca.gov](mailto:Julie.lugaro@dot.ca.gov).

Sincerely,

SCOTT SHELLEY  
Branch Chief, Regional-IGR-Transit Planning  
District 12

## Traffic Analysis for the California State University, Fullerton (CSUF) Master Plan

### City of Fullerton

#### Level-of-Service (LOS) Analysis for the following Scenarios

1. Existing Conditions
2. Existing Conditions with Project
3. Opening Day without Project (includes other background approved developments)
4. Opening Day with Project
5. Future Build Out without Project (City to provide future build out volumes)
6. Future Build Out with Project

The following 37 intersections are to be evaluated for level-of-service.

1. Bastanchury Rd at Harbor Blvd
2. Bastanchury Rd at Brea Blvd
3. Bastanchury Rd at State College Blvd
4. Bastanchury Rd at Associated Rd
5. Bastanchury Rd at Placentia Ave
6. Yorba Linda Blvd at State College Blvd
7. Yorba Linda Blvd at Associated Rd
8. Yorba Linda Blvd at SR-57 SB Ramps
9. Yorba Linda Blvd at SR-57 NB Ramps
10. Yorba Linda Blvd at Placentia Ave
11. State College Blvd at Dorothy Ln
12. State College Blvd at Nutwood Ave
13. Nutwood Ave at Commonwealth Ave
14. Nutwood Ave at Folino Dr
15. Nutwood Ave at SR-57 NB Ramps
16. Nutwood Ave at SR-57 NB Ramps
17. Nutwood Ave at Placentia Ave
18. Harbor Blvd at Valencia Mesa Dr
19. Harbor Blvd at Brea Blvd
20. Harbor Blvd at Berkeley Ave

21. Harbor Blvd at Chapman Ave
22. Harbor Blvd at Commonwealth Ave
23. Harbor Blvd at Orangethorpe Ave
24. Lemon St at Berkeley Ave
25. Lemon St at Chapman Ave
26. Lemon St at Commonwealth Ave
27. Lemon St at Orangethorpe Ave
28. Chapman Ave at Berkeley Ave
29. Chapman Ave at Raymond Ave
30. Chapman Ave at State College Blvd
31. Chapman Ave at Commonwealth Ave
32. Chapman Ave at SR-57 NB Ramps
33. Chapman Ave at SR-57 SB Ramps
34. Chapman Ave at Placentia Ave
35. State College Blvd at Orangethorpe Ave
36. Orangethorpe Ave at Raymond Ave
37. Orangethorpe Ave at Placentia Ave

The LOS analysis shall use the Highway Capacity Manual (HCM) methodology with the following assumptions.

- AM and PM peak hours (typical weekday)
  - o Traffic counts are to include vehicles, pedestrians and bicyclists
- Cycle Lengths of 110 seconds
- Saturation Flow Rates
  - o Left and Right Turn Lanes – 1,800
  - o Thru – 1,900
  - o Dual Left Turn Lanes – 3,500
- Intersection PHF
- Acceptable LOS for all intersections within the City of Fullerton is LOS D or better with the exception of Harbor/Chapman and Harbor/Commonwealth. The LOS criteria for those two intersections is LOS E or better.

Trip Generation and Trip Distribution will need to be approved by City staff.

**Senate Bill 743 (SB 743) – Vehicles Miles Traveled (VMT) Analysis**

Per SB 743, a project under California Environmental Quality Act (CEQA) review is to be evaluated using vehicles miles traveled (VMT) to determine if the project has any transportation impacts. VMT analysis will be required for this project. The City of Fullerton is currently developing a VMT evaluation methodology as well as VMT significant thresholds.

SCOPING MEETING

Please share your concerns related to the potential environmental impacts of the proposed CSU Fullerton Master Plan Update, and feel free to provide alternatives to the project design or ideas for mitigation measures. This form can be used in addition to, or instead of, making oral comments at the Scoping Meeting or submitting your comments separately by mail and email. Feel free to share this form with others who may not have been able to attend the Scoping Meeting.

How do you mitigate for heat island effect?

The Campus gets very hot from a lot of pavement. The campus needs more shade.

Comment cards can be submitted via mail or email until 5:00 p.m. on October 3, 2019 to:

- Campus run shuttles from  
Major transportation centers (DTR  
Train)
- water conservation measures
- more natural shade (not palm trees)
- more art (murals on buildings)

There have been complaints from campus staff about flooding/runoff in certain areas of campus.

This seems to be an important issue for staff/faculty especially during the rainy season.

With increased hardscape & buildings, please factor in shade in open space & along pedestrian pathways. This will help offset higher temperatures and emissions. Higher buildings may block movement of cooler air/breezes.

Events center - what kind of events, what times, what times of year, how many per month - All of this needs to be disclosed and limited. This facility could seriously increase the University's impacts on surrounding neighborhoods

Increasing the intensity of use at this location by adding 7,000 students to a 25,000 existing student population is a bit mind boggling to those of us who live nearby. Traffic on surrounding roads, including the 57 freeway, needs to be studied intensively. Parking that leaks onto surrounding streets needs to be addressed for impacts to residents, including crime and nuisance (litter, <sup>NOISE</sup> etc)

Utilities upgrades and their impacts to streets and neighbors must be accounted for.

Aesthetics: Are we urbanizing this essentially suburban area?

- Air circulation between + among buildings where air can be channeled dangerously during Santa Anas.

- California has a Master Plan for Aging because by 2030, the population of 60+ will far exceed the 18-24 year olds that are the target population for college/university campuses. Campus needs to be "age-friendly" and many of my concerns are for the OLLI - CSUF members who frequent the campus + the potential for older students that may alter the student population demographic.

- Water drainage through campus w/ so much hardscape + pathways - especially for those with mobility issues.
- Noise within areas of the campus w/ so many multi-storied buildings.
- Heat generation w/in spaces surrounded by tall buildings + glass.
- Hopefully walking pathways will be shaded, perhaps by trees that do not require much water
- Concern for distance of transit centers to RGC where members have mobility + transit issues.

- Not sure we need Fac. Housing? <sup>need survey?</sup>  
↳ Is there a call for this?
- A lot of housing? We need more academic space first!
- Why do we need an Event Center?  
(How often will that be used?) (last item) ↑
- Need more shade either trees or canopies
- More Benches/Tables w/ shade covers.

\* • Bridge/Ramp Nutwood #1 item \*  
need it now...

① ALL MAPS need to indicate building names, unless you know the Approx location of a building, you have no idea of what it is & whether it is going to stay, be demolished or expanded

② Parking is going to be an issue if you lose "E" to housing - Although you plan structures on "A" & "B" - those spaces will be lost during construction, so the same issues of today will be here tomorrow

### NOTICE OF PREPARATION OF PROGRAMMATIC ENVIRONMENTAL IMPACT REPORT FOR CAMPUS MASTER PLAN UPDATE, CALIFORNIA STATE UNIVERSITY, FULLERTON

Dear Mr. Zordilla:

The Department of Toxic Substances Control (DTSC) received a Notice of Preparation of Programmatic Environmental Impact Report (PEIR) for the California State University, Fullerton (CSUF).

The proposed project is to update the CSUF Educational and Facilities Master Plan to recommend future land uses, enhancement and replacement of existing facilities, infrastructure improvements, and improved intra-campus pedestrian connectivity.

DTSC recommends the following issues to be evaluated in the PEIR, Hazards and Hazardous Materials:

1. The EIR should identify and determine whether current or historic uses at the project site may have resulted in any release of hazardous wastes/substances.
2. If releases have occurred, further studies should be carried out to delineate the nature and extent of the contamination, and the potential threat to public health and/or the environment should be evaluated. The EIR should also identify the mechanism to initiate any required investigation and/or remediation and the government agency to provide appropriate regulatory oversight.

3. The EIR should identify any known or potentially contaminated sites within the proposed project area. For all identified sites, the EIR should evaluate whether conditions at those sites may pose a threat to human health or the environment.
4. The EIR should identify whether any buildings or other structures are to be demolished. If buildings or other structures are to be demolished, a survey should be conducted for the presence of lead-based paints or products, mercury, asbestos containing materials, and polychlorinated biphenyl caulk. Removal, demolition and disposal of any above-mentioned chemicals should be conducted in compliance with California environmental regulations and policies.
5. If the project proposes to import soil to backfill any excavated areas, proper sampling should be conducted to make sure that the imported soil is free of contamination. DTSC recommend the imported materials be characterized according to the Information Advisory Clean Imported Fill Material ([https://dtsc.ca.gov/wp-content/uploads/sites/31/2018/09/SMP\\_FS\\_Cleanfill-Schools.pdf](https://dtsc.ca.gov/wp-content/uploads/sites/31/2018/09/SMP_FS_Cleanfill-Schools.pdf)).
6. If the site has been used for agricultural, weed abatement or related activities, proper investigation for organochlorinated pesticides should be discussed in the EIR.

DTSC appreciates the opportunity to review the PEIR. Should you need any assistance in environmental investigation and/or remediation, please submit a request for Lead Agency Oversight Application which can be found at: <https://dtsc.ca.gov/brownfields/voluntary-agreements-quick-reference-guide/>.

Should you have any questions regarding this letter, please contact me at (714) 484-5392 or by e-mail at [ChiaRin.Yen@dtsc.ca.gov](mailto:ChiaRin.Yen@dtsc.ca.gov).

Sincerely,

Chia Rin Yen

**Subject:** Public Comment - CSUF Master Plan update EIR

The EIR should study an alternative in which the new Events Center is scrapped in favor of building additional on-campus student housing to further mitigate the increased enrollment. The should examine the costs and benefits of student housing compared to an events center, including the cost/revenue equation, the benefits of each use to the student population, and the impacts of each use to off-campus traffic and neighborhoods.

Jeff Maisch  
Fullerton

## NOP Comments and EIR Response

Commenter	Comment/Request	How and Where it was Addressed
<b>Agency Comments</b>		
California Department of Transportation (Caltrans)	<p>Refer to the Caltrans Guide for the preparation of Traffic Impact Studies when writing the Traffic Impact Study Report. After completion, the Traffic Impact Studies Report need to be submitted to Caltrans for review.</p> <p>Traffic Operations requests the use of the latest version of the Highway Capacity Manual (HCM 2016) methodologies when analyzing traffic impacts on the State Transportation Facilities.</p> <p>The use of either Synchro or HCS software is preferred. All input sheets, assumptions and volumes on State Facilities should be submitted to Caltrans for review and approval.</p> <p>Traffic Operations requests the analysis of freeway segment types: Merge/Diverge at On/Off Ramps, Weaving, Queuing and its Effects at Off Ramps, Mainline.</p> <p>Traffic Operations requests that the following State Route (SR) 57 intersections be included in the analysis: Chapman Avenue, Nutwood Avenue, and Yorba Linda Boulevard.</p> <p>Caltrans recommends discussing existing and proposed Complete Streets facilities and improvements.</p> <p>Recommends that a Complete Streets discussion includes the City of Fullerton’s Bicycle Master Plan.</p> <p>Recommends the Campus Master Plan consider the inclusion of amenities that help support overall Caltrans goals. Amenities may include electric vehicle chargers, short- and long-term bicycle parking.</p> <p>Recommends the Campus Master Plan include a discussion of micro-mobility and other new, emerging technologies (Electric Powered Vehicles, Transportation Network Companies etc.)</p> <p>Work proposed in the vicinity of the State right-of-way will require an encroachment permit, and all environmental concerns must be adequately addressed.</p> <p>Evaluate any temporary and permanent water quality impacts that the proposed Campus Master Plan may have on Caltrans Right of Way. Discharges must meet the latest version of the Caltrans</p>	<p>Comments are addressed in Sections 4.11, <i>Transportation</i> and 4.13, <i>Effects Found Not to Be Significant</i> under Hydrology and Water Quality.</p>

Commenter	Comment/Request	How and Where it was Addressed
<p>City of Fullerton</p>	<p>Statewide National Pollution Discharge and Elimination System (NPDES) Stormwater Permit.</p> <p>Requests Level of Service (LOS) Analysis for six scenarios: Existing Conditions, Existing Conditions with Project, Opening Day without Project, Opening Day with Project, Future Build out without Project, Future Build Out with Project.</p> <p>Requests LOS Analysis for 37 intersections throughout the immediate vicinity.</p> <p>LOS Analysis should use the Highway Capacity Manual (HCM) methodology with a specific set of assumptions: AM and PM peak hours, Cycle Lengths of 110 Seconds, Saturation Flow Rates, Intersection peak hour factor (PHF), Acceptable LOS for all intersections within the City of Fullerton is LOS D or better.</p> <p>Trip Generation and Trip Distribution will need to be approved by City staff.</p> <p>A project under CEQA review is to be evaluated using vehicle miles traveled (VMT) to determine if the project has any transportation impacts.</p>	<p>Comments are addressed in Section 4.11, <i>Transportation</i>.</p>
<p>California Department of Toxic Substances Control (DTSC)</p>	<p>Recommends the EIR to identify and determine whether current or historic uses at the campus may have resulted in any release of hazardous wastes/substances.</p> <p>Requests further studies to be carried out if toxic substance releases have occurred to delineate the nature and extent of the contamination. In addition, the EIR should also identify the mechanism to initiate any required investigation and/or remediation and the government agency to provide regulatory oversight.</p> <p>The EIR should identify any known or potentially contaminated sites within the campus. For identified sites, the EIR should evaluate whether may pose a threat to human health or the environment.</p> <p>The EIR should identify whether any buildings or other structures are to be demolished. Commenter	Comment/Request	How and Where it was Addressed
	<p>includes soil import for backfill to ensure soil is free of contamination.</p> <p>Proper investigation for organochlorinated pesticides should be discussed in the EIR if the campus has been used for agricultural, weed abatement, or other related activities.</p>	
<p>Orange County Transportation Authority (OCTA)</p>	<p>Please clarify that Chapman Avenue from North State College Boulevard to Placentia Avenue is designated as a Major Arterial per the Orange County Master Plan of Arterial Highways (MPAH). Please ensure CSUF works closely with the City of Fullerton.</p> <p>The campus is served by four OCTA bus routes that connect into OCTA’s network of countywide bus service, including: Route 24, Route 26, Route 57/57x, and Route 153.</p> <p>The proposed northern mobility hub along Yorba Linda Boulevard could be served by Route 153. There are concerns about the additional time it would take buses to enter and exit hub. Consider dedicated roadways/ driveways to allow the bus to enter and exit the hub impeded by general traffic.</p> <p>West mobility hub along North State College Boulevard could be served by Route 57/57x. Recommends keeping stops on North State College Boulevard immediately adjacent to hub. OCTA is amenable to moving the bus stops along North State College Boulevard to ensure a direction connection to the hub.</p> <p>South mobility hub along Nutwood Avenue is not compatible with the current routing system. Recommends the placement of bus stops on the street or moving the hub closer to the intersection of Nutwood Avenue and Commonwealth Avenue with a dedicated entry/exist for buses. This hub could be served by Route 24 and Route 26.</p>	<p>Comments are addressed in Section 4.11, <i>Transportation</i>.</p>

**Public Comments**

<p>Transportation</p>	<ul style="list-style-type: none"> <li>• Campus shuttle should connect to City destinations such as Downtown Fullerton.</li> <li>• Traffic on surrounding roads including SR 57, needs to be studied intensively. Parking leaks onto surrounding streets needs to be addressed for impacts to residents, including crime and nuisance.</li> </ul>	<p>Comments are addressed in Section 4.11, <i>Transportation</i>.</p>
-----------------------	---	---

Commenter	Comment/Request	How and Where it was Addressed
	<ul style="list-style-type: none"> <li>• Concern for distance of transit centers to Ruby Gerontology Center where members have mobility and transit issues.</li> <li>• The pedestrian/bicycle bridge over Nutwood Avenue is needed.</li> </ul>	
Aesthetics	<ul style="list-style-type: none"> <li>• The campus could use some more campus art and murals.</li> <li>• By expanding the campus square footage and amenities, are we urbanizing this once suburban community?</li> <li>• By 2040, the population of 60-year-old people and up will exceed the 18-24 age range. The campus needs to be more “age friendly” who frequent the campus regularly such as Osher Lifelong Learning Institute members and older faculty/staff.</li> <li>• Noise levels on campus elevate between tall buildings.</li> <li>• The campus could use more tables and chairs and places for people to congregate.</li> </ul>	Comments are addressed in Sections 4.1, <i>Aesthetics</i> and 4.7, <i>Noise</i> .
Housing	<ul style="list-style-type: none"> <li>▪ Not sure if faculty housing is immediately needed. Could we put together a survey?</li> <li>▪ Why is the university focusing on building more housing? The focus needs to be building more academic space first.</li> </ul>	Comments are addressed <i>in</i> Section 4.8, <i>Population and Housing</i> .
Climate	<ul style="list-style-type: none"> <li>▪ How do you mitigate against the heat island affect? The campus gets very hot in the summertime. The campus needs more shade.</li> <li>▪ More natural shade on campus is needed for the summer months.</li> <li>▪ With increased hardscape and buildings, please factor in shade in open spaces and along pedestrian pathways. This will help offset higher temperatures and emissions on campus.</li> <li>▪ Air circulation between and among buildings where air can be challenged during the Santa Anas may help heat issues on campus.</li> <li>▪ Trees among walking pathways are needed, especially in the summer months. Hopefully these trees can be drought tolerant trees.</li> <li>▪ The campus needs more shade covers, particularly over tables, and gathering areas.</li> </ul>	Comments are addressed in Sections 2.0, <i>Project Description</i> , 4.1, <i>Aesthetics</i> , and 4.10, <i>Recreation</i> .

Commenter	Comment/Request	How and Where it was Addressed
Event Center	<ul style="list-style-type: none"> <li>▪ Do we really need a new Event Center? Has there been a survey or analysis done as to why this is a necessary component?</li> <li>▪ Regarding the Event Center, what kind of events are going to be held there? What times in the year and what times of the day are events going to be held? All this information needs to be disclosed.</li> </ul>	<p>The planning and development of the Campus Master Plan is discussed in Section 2.3.1, <i>Project Description</i>. The use of the Event Center is discussed in Section 2.5.4, <i>Project Description</i>. Additional discussions surrounding the Event Center are not required to be analyzed under CEQA.</p>
Utilities	<ul style="list-style-type: none"> <li>▪ More water conservation on campus could be implemented to help conserve water in the winter months.</li> <li>▪ There have been complaints from staff and faculty about flooding on certain areas of the campus.</li> <li>▪ Water draining through the campus has been an issue, particularly for people with mobility issues.</li> </ul>	<p>Comments are addressed in Sections 4.12, <i>Utilities and Service Systems</i> and 4.13, <i>Effects Found Not to Be Significant</i> under Hydrology and Water Quality.</p>
Impacts on Surrounding Neighborhoods	<ul style="list-style-type: none"> <li>▪ There is a concern whether the Event Center will impose negative impacts to surrounding neighbors such as noise, traffic and mobility issues, and crime.</li> <li>▪ Parking that overflows into the surrounding neighborhoods and streets needs to be heavily evaluated and mitigated.</li> </ul>	<p>Comments on the impacts resulting from the Campus Master Plan are addressed in Sections 4.1, <i>Aesthetics</i>, 4.7, <i>Noise</i>, 4.9, <i>Public Services</i>, and 4.11, <i>Transportation</i>. Parking is discussed in Section 2.5.9, <i>Project Description</i>, and is not a topic that requires further analysis under CEQA.</p>
Construction Impacts	<ul style="list-style-type: none"> <li>▪ Parking will be a continued issue when parking lots and structures are being built.</li> <li>▪ Parking is going to be an issue if you lose Lot E to housing. Additionally, parking during construction will be an issue to both students and faculty/staff.</li> </ul>	<p>Parking is discussed in Section 2.5.9, <i>Project Description</i>, and is not a topic that requires further analysis under CEQA.</p>

**Subject: California State University, Fullerton Campus Master Plan  
Update Notice of Preparation**

Dear Mr. Zordilla:

Thank you for providing the Orange County Transportation Authority (OCTA) with the Notice of Preparation (NOP) for the California State University, Fullerton (CSUF) Campus Master Plan Update (Plan). Please see the attachment for comments related to the Master Plan of Arterial Highways, transit service, and related planning efforts. Given the proposed Plan is currently at the NOP stage, OCTA encourages CSUF to integrate the attached information into the Draft Environmental Impact Report, as appropriate.

Throughout the development of this Plan, we encourage communication with OCTA on any matters discussed herein. If you have any questions or comments, please contact me at (714) 560-5907 or [dphu@octa.net](mailto:dphu@octa.net).

Sincerely,

Dan Phu  
Manager, Environmental Programs

**California State University, Fullerton Campus Master Plan Update  
Notice of Preparation**

**Orange County Transportation Authority (OCTA) Comments**

**Master Plan of Arterial Highways (MPAH)**

- Please note that Chapman Avenue from State College Boulevard to Placentia Avenue is designated as a Major (six-lane divided) Arterial per the Orange County MPAH. Please ensure the project sponsor works closely with the City of Fullerton to preserve the right-of-way necessary for the buildout of Chapman Avenue consistent with the MPAH.

**Current Transit Service to the California State University, Fullerton (CSUF) Campus**

- The CSUF campus is served by four OCTA bus routes, which connect into our network of countywide bus service. Below is a detailed description of each route alignment and frequency:

- Route 24

Route 24 travels predominantly down Malvern Avenue and Chapman Avenue from the Buena Park Metrolink Station to the Village at Orange with an approximately 60-minute frequency. The route turns north on State College Boulevard, east on Nutwood Avenue past the south side of campus, and south on Placentia Avenue, back to Chapman Avenue before continuing to the Village at Orange. Route 24 travels along the same streets in reverse order when going eastbound from the Village at Orange back to the Buena Park Metrolink Station. This route only provides service during weekdays only from approximately 5:30 a.m. to 9:00 p.m.

In February 2020, OCTA will be combining Route 24 with Route 21 to become the new Route 123. The termini of Route 123 will be the Anaheim Canyon Metrolink Station instead of the Village of Orange in the east, and will use the regular Route 24 routing past CSUF to the Buena Park Metrolink Station, and then along the regular Route 21 alignment on Valley View Boulevard to terminate at the Golden West Transportation Center in Huntington Beach. The new Route 123 will continue to have approximately one-hour headways between 5:30 a.m. and 9:00 p.m. on weekdays. This route does not operate on weekends.

## California State University, Fullerton Campus Master Plan Update Notice of Preparation

- Route 26

Route 26 travels from the Fullerton Park and Ride to Yorba Linda Boulevard and Rose Drive in the City of Yorba Linda via Commonwealth Avenue, Nutwood Avenue, and Placentia Avenue. Weekday service between the Fullerton Park and Ride and CSUF is provided at a 15-minute frequency and at a 30-minute frequency during the midday and early evening. Every other peak trip continues east to Yorba Linda Boulevard and Rose Drive at a 30-minute peak frequency and 30-minute midday and early evening frequency. Weekday service is provided from 5:00 a.m. to 10:00 p.m. Weekend service is also provided on this route from 8:00 a.m. to 6:00 p.m. every 40 minutes. This route is the key connection between the Fullerton Transportation Center (Metrolink/Amtrak), Downtown Fullerton, and CSUF.

The east end of this route will be extended to Yorba Linda Boulevard and Imperial Highway in October 2019. The peak service between the Fullerton Park and Ride and CSUF will be slightly reduced to every 20 minutes to help offset the costs of extending the route.

- Route 57/57X

Route 57X travels predominantly along Bristol Street and State College Boulevard from the Newport Transportation Center to the Brea Mall with approximately 24-minute peak and midday frequencies. When traveling northbound on State College Boulevard past CSUF, Route 57 stops on the far side of Nutwood Avenue, far side Student Union Way, and far side of Corporation Drive. When travelling southbound, there are stops located at the far side of the same intersections. This route has weekday service from 4:00 a.m. to 12:30 a.m. Weekend service is every 30 minutes with similar service hours on weekdays.

- Route 153

Route 153 travels from the Anaheim Regional Transportation Intermodal Center to the Brea Mall with an approximate 60-minute frequency. When travelling northbound on Placentia Avenue, the bus turns left on Yorba Linda Boulevard, then turns right on Associated Road, and stops just at the far side of northbound Associated Road/Yorba Linda Boulevard intersection. When travelling southbound, Route 153 uses the same streets in reverse order and stops at the eastbound direction, far-side of Yoba Linda Boulevard and Campus Drive service is approximately every 55 minutes from 5:00 a.m. to 9:30 p.m. on weekdays. Weekend service is every 60 minutes from 7:00 a.m. to 7:00 p.m.

## California State University, Fullerton Campus Master Plan Update Notice of Preparation

### Long-Range Transit Plans

- In February 2018, OCTA completed the OC Transit Vision, a 20-year plan for enhancing and expanding public transit service in Orange County. The plan identifies the most promising corridors for major investments in high quality transit. Two of these “Transit Opportunity Corridors” would directly serve the CSUF campus. These include the “North Harbor” and “Bristol & State College” corridors. OCTA will be studying high-quality transit improvements on these corridors which may include enhanced buses, bus rapid transit, or streetcar technologies. For more information on the OC Transit Vision, please visit: <https://www.octa.net/Projects-and-Programs/Plans-and-Studies/Transit-Master-Plan/>.

### Mobility Hubs

- OCTA has review the proposed mobility hub locations and has the following comments:
  - Northern Mobility Hub (Yorba Linda Boulevard)  
This hub could be served by OCTA Route 153. We have concerns about the additional time it would take our buses to enter and exit the hub. Please consider dedicated roadways/driveways to allow the bus to enter and exit the hub unimpeded by general traffic.
  - West Mobility Hub (State College Boulevard)  
This hub would be served by OCTA Route 57/57X. OCTA recommends keeping these bus stops on State College Boulevard immediately adjacent to the mobility hub. We are amenable to moving the bus stops along State College Boulevard to ensure a direction connection to the hub. Consider a dedicated pedestrian signal to allow customers to cross directly from the hub to the stop on southbound State College Avenue.
  - South Mobility Hub (Nutwood Avenue)  
The proposed hub location is not compatible with our current routing system. We encourage the placement of bus stops on the street or moving the hub closer to the intersection of Nutwood Avenue and Commonwealth Avenue with a dedicated entry/exit for our buses. This hub could be served by routes 24 (future Route 123) & 26.

<b>Urbanization</b>	Urban	<b>Wind Speed (m/s)</b>	2.2	<b>Precipitation Freq (Days)</b>	30
<b>Climate Zone</b>	8			<b>Operational Year</b>	2035
<b>Utility Company</b>	Southern California Edison				
<b>CO2 Intensity (lb/MWhr)</b>	702.44	<b>CH4 Intensity (lb/MWhr)</b>	0.029	<b>N2O Intensity (lb/MWhr)</b>	0.006

**1.3 User Entered Comments & Non-Default Data**

CSUF MPU - Construction Phase 1 - Orange County, Annual

Project Characteristics - CalEEMod operational years jump from 2035 to 2040, therefore earlier (more conservative) year of 2035 used for project buildout of 2039

Land Use - CalEEMod only allows for student # input for education; student # input calibrated to equal proposed SF and does not represent # of students served by land use during this phase; academic use includes amenities, academic space, and mobility hub

Construction Phase - Building construction length reduced to be consistent with CMP timeline; arch coating assumed to begin after building construction and extended for realistic timeline for painting project SF

Off-road Equipment -

Off-road Equipment - No welders anticipated.

Off-road Equipment -

Off-road Equipment -

Off-road Equipment -

Off-road Equipment -

Trips and VMT -

Demolition - Demo determined by Google Earth analysis of building footprint/floors

Grading - Export/import conservatively determined by SF from phase \* 20 depth of cut. 50% exported and 50% imported.

Architectural Coating - Compliance with SCAQMD Rule 1113

Vehicle Emission Factors -

Vehicle Emission Factors -

Vehicle Emission Factors -

Woodstoves - No fireplaces/woodstoves assumed for housing

Area Coating - Compliance with SCAQMD Rule 1113

Energy Use -

Water And Wastewater -

Solid Waste -

Construction Off-road Equipment Mitigation - Construction would require Tier 4 engines; projects would comply with SCAQMD rules re: fugitive dust.

Mobile Commute Mitigation -

Area Mitigation -

Fleet Mix -

**1.3 User Entered Comments & Non-Default Data**

CSUF MPU - Construction Phase 1 - Orange County, Winter

Project Characteristics - CalEEMod operational years jump from 2035 to 2040, therefore earlier (more conservative) year of 2035 used for project buildout of 2039

Land Use - CalEEMod only allows for student # input for education; student # input calibrated to equal proposed SF and does not represent # of students served by land use during this phase; academic use includes amenities, academic space, and mobility hub

Construction Phase - Building construction length reduced to be consistent with CMP timeline; arch coating assumed to begin after building construction and extended for realistic timeline for painting project SF

Off-road Equipment -

Off-road Equipment - No welders anticipated.

Off-road Equipment -

Off-road Equipment -

Off-road Equipment -

Off-road Equipment -

Trips and VMT -

Demolition - Demo determined by Google Earth analysis of building footprint/floors

Grading - Export/import conservatively determined by SF from phase \* 20 depth of cut. 50% exported and 50% imported.

Architectural Coating - Compliance with SCAQMD Rule 1113

Vehicle Emission Factors -

Vehicle Emission Factors -

Vehicle Emission Factors -

Woodstoves - No fireplaces/woodstoves assumed for housing

Area Coating - Compliance with SCAQMD Rule 1113

Energy Use -

Water And Wastewater -

Solid Waste -

Construction Off-road Equipment Mitigation - Construction would require Tier 4 engines; projects would comply with SCAQMD rules re: fugitive dust.

Mobile Commute Mitigation -

Area Mitigation -

Fleet Mix -

**1.3 User Entered Comments & Non-Default Data**

CSUF MPU - Construction Phase 2 - Orange County, Annual

Project Characteristics - CalEEMod operational years jump from 2035 to 2040, therefore earlier (more conservative) year of 2035 used for project buildout of 2039

Land Use - CalEEMod only allows for student # input for education; student # input calibrated to equal proposed SF, does not represent # of students served by land use; educational includes campus amenities, academic space, and arboretum facilities.

Construction Phase - Construction phases extended through 2024

Trips and VMT -

Grading -

Architectural Coating - Compliance with SCAQMD Rule 1113

Area Coating -

Energy Use -

Water And Wastewater -

Solid Waste -

Construction Off-road Equipment Mitigation - Construction would require Tier 4 engines; projects would comply with SCAQMD rules re: fugitive dust

CSUF MPU - Construction Phase 2 - Orange County, Winter

Project Characteristics - CalEEMod operational years jump from 2035 to 2040, therefore earlier (more conservative) year of 2035 used for project buildout of 2039

Land Use - CalEEMod only allows for student # input for education; student # input calibrated to equal proposed SF, does not represent # of students served by land use; educational includes campus amenities, academic space, and arboretum facilities.

Construction Phase - Construction phases extended through 2024

Trips and VMT -

Grading -

Architectural Coating - Compliance with SCAQMD Rule 1113

Area Coating -

Energy Use -

Water And Wastewater -

Solid Waste -

Construction Off-road Equipment Mitigation - Construction would require Tier 4 engines; projects would comply with SCAQMD rules re: fugitive dust

**1.3 User Entered Comments & Non-Default Data**

CSUF MPU - Construction Phase 3 - Orange County, Annual

Project Characteristics - CalEEMod operational years jump from 2035 to 2040, therefore earlier (more conservative) year of 2035 used for project buildout of 2039

Land Use - CalEEMod only allows for student # input for education; student # input calibrated to equal proposed SF, does not represent # of students served; academic space/amenities/innovation center combined under educational

Construction Phase - Construction phases extended by 100% (except building construction) to be consistent with plan timeline

Off-road Equipment -

Off-road Equipment - Welders not anticipated for building construction

Off-road Equipment - '

Off-road Equipment -

Off-road Equipment - '

Off-road Equipment -

Trips and VMT -

Demolition - Demo determined by Google Earth analysis of building footprint/floors

Grading - Export/import conservatively determined by SF from phase \* 20 depth of cut. 50% exported and 50% imported.

Architectural Coating - Compliance with SCAQMD Rule 1113

Vehicle Emission Factors -

Vehicle Emission Factors -

Vehicle Emission Factors -

Area Coating -

Energy Use -

Water And Wastewater -

Solid Waste -

Construction Off-road Equipment Mitigation - Construction would require Tier 4 engines; projects would comply with SCAQMD rules re: fugitive dust

Mobile Commute Mitigation -

Area Mitigation -

Fleet Mix -

CSUF MPU - Construction Phase 3 - Orange County, Winter

Project Characteristics - CalEEMod operational years jump from 2035 to 2040, therefore earlier (more conservative) year of 2035 used for project buildout of 2039

Land Use - CalEEMod only allows for student # input for education; student # input calibrated to equal proposed SF, does not represent # of students served; academic space/amenities/innovation center combined under educational

Construction Phase - Construction phases extended by 100% (except building construction) to be consistent with plan timeline

Off-road Equipment -

Off-road Equipment - Welders not anticipated for building construction

Off-road Equipment - '

Off-road Equipment -

Off-road Equipment - '

Off-road Equipment -

Trips and VMT -

Demolition - Demo determined by Google Earth analysis of building footprint/floors

Grading - Export/import conservatively determined by SF from phase \* 20 depth of cut. 50% exported and 50% imported.

Architectural Coating - Compliance with SCAQMD Rule 1113

Vehicle Emission Factors -

Vehicle Emission Factors -

Vehicle Emission Factors -

Area Coating -

Energy Use -

Water And Wastewater -

Solid Waste -

Construction Off-road Equipment Mitigation - Construction would require Tier 4 engines; projects would comply with SCAQMD rules re: fugitive dust

Mobile Commute Mitigation -

Area Mitigation -

Fleet Mix -

**CLERK SUPREME COURT**

**TABLE OF CONTENTS**

APPLICATION FOR LEAVE TO FILE *amicus curiae* brief..... App-1

HOW THIS BRIEF WILL ASSIST THE COURT ..... App-1

STATEMENT OF INTEREST OF *AMICUS CURIAE*..... App-3

CERTIFICATION REGARDING AUTHORSHIP & FUNDING ..... App-4

BRIEF OF AMICUS CURIAE..... 1

SUMMARY OF ARGUMENT ..... 1

ARGUMENT ..... 2

I. RELEVANT FACTUAL AND LEGAL FRAMEWORK. .... 2

    A. Air Quality Regulatory Background .....2

    B. The SCAQMD's Role Under CEQA..... 6

II. THIS COURT SHOULD NOT SET A HARD-AND-FAST  
RULE CONCERNING THE EXTENT TO WHICH AN EIR  
MUST CORRELATE A PROJECT'S EMISSION OF  
POLLUTANTS WITH RESULTING HEALTH IMPACTS..... 8

III. THE QUESTION OF WHETHER AN EIR CONTAINS  
SUFFICIENT ANALYSIS TO MEET CEQA'S  
REQUIREMENTS IS A MIXED QUESTION OF FACT  
AND LAW GOVERNED BY TWO DIFFERENT  
STANDARDS OF REVIEW..... 16

    A. Standard of Review for Feasibility Determination and  
Sufficiency as an Informative Document ..... 16

    B. Friant Ranch's Rationale for Rejecting the Independent  
Judgment Standard of Review is Unsupported by Case  
Law..... 23

IV. COURTS MUST SCRUPULOUSLY ENFORCE THE  
REQUIREMENTS THAT LEAD AGENCIES CONSULT  
WITH AND OBTAIN COMMENTS FROM AIR  
DISTRICTS..... 26

CONCLUSION ..... 29

**TO THE HONORABLE CHIEF JUSTICE AND JUSTICES OF THE  
SUPREME COURT:**

**APPLICATION FOR LEAVE TO FILE *AMICUS CURIAE* BRIEF**

Pursuant to Rule 8.520(f) of the California Rules of Court, the South Coast Air Quality Management District (SCAQMD) respectfully requests leave to file the attached *amicus curiae* brief. Because SCAQMD's position differs from that of either party, we request leave to submit this *amicus* brief in support of neither party.

**HOW THIS BRIEF WILL ASSIST THE COURT**

SCAQMD's proposed *amicus* brief takes a position on two of the issues in this case. In both instances, its position differs from that of either party. The issues are:

- 1) Does the California Environmental Quality Act (CEQA) require an environmental impact report (EIR) to correlate a project's air pollution emissions with specific levels of health impacts?
- 2) What is the proper standard of review for determining whether an EIR provides sufficient information on the health impacts caused by a project's emission of air pollutants?

This brief will assist the Court by discussing the practical realities of correlating identified air quality impacts with specific health outcomes. In short, CEQA requires agencies to provide detailed information about a project's air quality impacts that is sufficient for the public and decisionmakers to adequately evaluate the project and meaningfully understand its impacts. However, the level of analysis is governed by a rule of reason; CEQA only requires agencies to conduct analysis if it is reasonably feasible to do so.

With regard to health-related air quality impacts, an analysis that correlates a project's air pollution emissions with specific levels of health impacts will be feasible in some cases but not others. Whether it is feasible depends on a variety of factors, including the nature of the project and the nature of the analysis under consideration. The feasibility of analysis may also change over time as air districts and others develop new tools for measuring projects' air quality related health impacts. Because SCAQMD has among the most sophisticated air quality modeling and health impact evaluation capability of any of the air districts in the State, it is uniquely situated to express an opinion on the extent to which the Court should hold that CEQA requires lead agencies to correlate air quality impacts with specific health outcomes.

SCAQMD can also offer a unique perspective on the question of the appropriate standard of review. SCAQMD submits that the proper standard of review for determining whether an EIR is sufficient as an informational document is more nuanced than argued by either party. In our view, this is a mixed question of fact and law. It includes determining whether additional analysis is feasible, which is primarily a factual question that should be reviewed under the substantial evidence standard. However, it also involves determining whether the omission of a particular analysis renders an EIR insufficient to serve CEQA's purpose as a meaningful, informational document. If a lead agency has not determined that a requested analysis is infeasible, it is the court's role to determine whether the EIR nevertheless meets CEQA's purposes, and courts should not defer to the lead agency's conclusions regarding the legal sufficiency of an EIR's analysis. The ultimate question of whether an EIR's analysis is "sufficient" to serve CEQA's informational purposes is predominately a question of law that courts should review *de novo*.

This brief will explain the rationale for these arguments and may assist the Court in reaching a conclusion that accords proper respect to a lead agency's factual conclusions while maintaining judicial authority over the ultimate question of what level of analysis CEQA requires.

#### **STATEMENT OF INTEREST OF *AMICUS CURIAE***

The SCAQMD is the regional agency primarily responsible for air pollution control in the South Coast Air Basin, which consists of all of Orange County and the non-desert portions of the Los Angeles, Riverside, and San Bernardino Counties. (Health & Saf. Code § 40410; Cal. Code Regs., tit. 17, § 60104.) The SCAQMD participates in the CEQA process in several ways. Sometimes it acts as a lead agency that prepares CEQA documents for projects. Other times it acts as a responsible agency when it has permit authority over some part of a project that is undergoing CEQA review by a different lead agency. Finally, SCAQMD also acts as a commenting agency for CEQA documents that it receives because it is a public agency with jurisdiction by law over natural resources affected by the project.

In all of these capacities, SCAQMD will be affected by the decision in this case. SCAQMD sometimes submits comments requesting that a lead agency perform an additional type of air quality or health impacts analysis. On the other hand, SCAQMD sometimes determines that a particular type of health impact analysis is not feasible or would not produce reliable and informative results. Thus, SCAQMD will be affected by the Court's resolution of the extent to which CEQA requires EIRs to correlate emissions and health impacts, and its resolution of the proper standard of review.

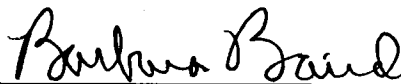

**CERTIFICATION REGARDING AUTHORSHIP AND FUNDING**

No party or counsel in the pending case authored the proposed amicus curiae brief in whole or in part, or made any monetary contribution intended to fund the preparation or submission of the brief. No person or entity other than the proposed *Amicus Curiae* made any monetary contribution intended to fund the preparation or submission of the brief.

Respectfully submitted,

DATED: April 3, 2015

SOUTH COAST AIR QUALITY  
MANAGEMENT DISTRICT  
KURT R. WIESE, GENERAL COUNSEL  
BARBARA BAIRD, CHIEF DEPUTY COUNSEL

By:   
Barbara Baird

*Attorneys for [proposed] Amicus Curiae*  
*SOUTH COAST AIR QUALITY*  
*MANAGEMENT DISTRICT*

## BRIEF OF AMICUS CURIAE

### SUMMARY OF ARGUMENT

The South Coast Air Quality Management District (SCAQMD) submits that this Court should not try to establish a hard-and-fast rule concerning whether lead agencies are required to correlate emissions of air pollutants with specific health consequences in their environmental impact reports (EIR). The level of detail required in EIRs is governed by a few, core CEQA (California Environmental Quality Act) principles. As this Court has stated, “[a]n EIR must include detail sufficient to enable those who did not participate in its preparation to understand and to consider meaningfully the issues raised by the proposed project.” (*Laurel Heights Improvement Assn. v. Regents of the Univ of Cal.* (1988) 47 Cal.3d 376, 405 [*“Laurel Heights I”*]) Accordingly, “an agency must use its best efforts to find out and disclose all that it reasonably can.” (*Vineyard Area Citizens for Responsible Growth, Inc. v. City of Rancho Cordova* (2007) 40 Cal.4th 412, 428 (quoting CEQA Guidelines § 15144)<sup>1</sup>). However, “[a]nalysis of environmental effects need not be exhaustive, but will be judged in light of what is reasonably feasible.” (*Association of Irrigated Residents v. County of Madera* (2003) 107 Cal.App.4th 1383, 1390; CEQA Guidelines §§ 15151, 15204(a).)

With regard to analysis of air quality related health impacts, EIRs must generally quantify a project’s pollutant emissions, but in some cases it is not feasible to correlate these emissions to specific, quantifiable health impacts (e.g., premature mortality; hospital admissions). In such cases, a general description of the adverse health impacts resulting from the pollutants at issue may be sufficient. In other cases, due to the magnitude

---

<sup>1</sup> The CEQA Guidelines are found at Cal. Code Regs., tit. 14 §§ 15000, *et seq.*

or nature of the pollution emissions, as well as the specificity of the project involved, it may be feasible to quantify health impacts. Or there may be a less exacting, but still meaningful analysis of health impacts that can feasibly be performed. In these instances, agencies should disclose those impacts.

SCAQMD also submits that whether or not an EIR complies with CEQA's informational mandates by providing sufficient, feasible analysis is a mixed question of fact and law. Pertinent here, the question of whether an EIR's discussion of health impacts from air pollution is sufficient to allow the public to understand and consider meaningfully the issues involves two inquiries: (1) Is it feasible to provide the information or analysis that a commenter is requesting or a petitioner is arguing should be required?; and (2) Even if it is feasible, is the agency relying on other policy or legal considerations to justify not preparing the requested analysis? The first question of whether an analysis is feasible is primarily a question of fact that should be judged by the substantial evidence standard. The second inquiry involves evaluating CEQA's information disclosure purposes against the asserted reasons to not perform the requested analysis. For example, an agency might believe that its EIR meets CEQA's informational disclosure standards even without a particular analysis, and therefore choose not to conduct that analysis. SCAQMD submits that this is more of a legal question, which should be reviewed de novo as a question of law.

## **ARGUMENT**

### **I. RELEVANT FACTUAL AND LEGAL FRAMEWORK.**

#### **A. Air Quality Regulatory Background**

The South Coast Air Quality Management District (SCAQMD) is one of the local and regional air pollution control districts and air quality

management districts in California. The SCAQMD is the regional air pollution agency for the South Coast Air Basin, which consists of all of Orange County and the non-desert portions of Los Angeles, Riverside, and San Bernardino Counties. (Health & Saf. Code § 40410, 17 Cal. Code Reg. § 60104.) The SCAQMD also includes the Coachella Valley in Riverside County (Palm Springs area to the Salton Sea). (SCAQMD, *Final 2012 AQMP (Feb. 2013)*, <http://www.aqmd.gov/home/library/clean-air-plans/air-quality-mgt-plan/final-2012-air-quality-management-plan>; then follow “chapter 7” hyperlink; pp 7-1, 7-3 (last visited Apr. 1, 2015).) The SCAQMD's jurisdiction includes over 16 million residents and has the worst or nearly the worst air pollution levels in the country for ozone and fine particulate matter. (SCAQMD, *Final 2012 AQMP (Feb. 2013)*, <http://www.aqmd.gov/home/library/clean-air-plans/air-quality-mgt-plan/final-2012-air-quality-management-plan>; then follow “Executive Summary” hyperlink p. ES-1 (last visited Apr. 1, 2015).)

Under California law, the local and regional districts are primarily responsible for controlling air pollution from all sources except motor vehicles. (Health & Saf. Code § 40000.) The California Air Resources Board (CARB), part of the California Environmental Protection Agency, is primarily responsible for controlling pollution from motor vehicles. (*Id.*) The air districts must adopt rules to achieve and maintain the state and federal ambient air quality standards within their jurisdictions. (Health & Saf. Code § 40001.)

The federal Clean Air Act (CAA) requires the United States Environmental Protection Agency (EPA) to identify pollutants that are widely distributed and pose a threat to human health, developing a so-called “criteria” document. (42 U.S.C. § 7408; CAA § 108.) These pollutants are frequently called “criteria pollutants.” EPA must then establish “national ambient air quality standards” at levels “requisite to protect public health”,

allowing “an adequate margin of safety.” (42 U.S.C. § 7409; CAA § 109.) EPA has set standards for six identified pollutants: ozone, nitrogen dioxide, sulfur dioxide, carbon monoxide, particulate matter (PM), and lead. (U.S. EPA, National Ambient Air Quality Standards (NAAQS), <http://www.epa.gov/air/criteria.html> (last updated Oct. 21, 2014).)<sup>2</sup>

Under the Clean Air Act, EPA sets emission standards for motor vehicles and “nonroad engines” (mobile farm and construction equipment, marine vessels, locomotives, aircraft, etc.). (42 U.S.C. §§ 7521, 7547; CAA §§ 202, 213.) California is the only state allowed to establish emission standards for motor vehicles and most nonroad sources; however, it may only do so with EPA's approval. (42 U.S.C. §§ 7543(b), 7543(e); CAA §§ 209(b), 209(c).) Sources such as manufacturing facilities, power plants and refineries that are not mobile are often referred to as “stationary sources.” The Clean Air Act charges state and local agencies with the primary responsibility to attain the national ambient air quality standards. (42 U.S.C. § 7401(a)(3); CAA § 101(a)(3).) Each state must adopt and implement a plan including enforceable measures to achieve and maintain the national ambient air quality standards. (42 U.S.C. § 7410; CAA § 110.) The SCAQMD and CARB jointly prepare portion of the plan for the South Coast Air Basin and submit it for approval by EPA. (Health & Saf. Code §§ 40460, et seq.)

The Clean Air Act also requires state and local agencies to adopt a permit program requiring, among other things, that new or modified “major” stationary sources use technology to achieve the “lowest achievable emission rate,” and to control minor stationary sources as

---

<sup>2</sup> Particulate matter (PM) is further divided into two categories: fine particulate or PM<sub>2.5</sub> (particles with a diameter of less than or equal to 2.5 microns) and coarse particulate (PM<sub>10</sub>) (particles with a diameter of 10 microns or less). (U.S. EPA, Particulate Matter (PM), <http://www.epa.gov/airquality/particulatepollution/> (last visited Apr. 1, 2015).)

needed to help attain the standards. (42 U.S.C. §§ 7502(c)(5), 7503(a)(2), 7410(a)(2)(C); CAA §§ 172(c)(5), 173(a)(2), 110(a)(2)(C).) The air districts implement these permit programs in California. (Health & Saf. Code §§ 42300, et seq.)

The Clean Air Act also sets out a regulatory structure for over 100 so-called “hazardous air pollutants” calling for EPA to establish “maximum achievable control technology” (MACT) for sources of these pollutants. (42 U.S.C. § 7412(d)(2); CAA § 112(d)(2).) California refers to these pollutants as “toxic air contaminants” (TACs) which are subject to two state-required programs. The first program requires “air toxics control measures” for specific categories of sources. (Health & Saf. Code § 39666.) The other program requires larger stationary sources and sources identified by air districts to prepare “health risk assessments” for impacts of toxic air contaminants. (Health & Saf. Code §§ 44320(b), 44322, 44360.) If the health risk exceeds levels identified by the district as “significant,” the facility must implement a “risk reduction plan” to bring its risk levels below “significant” levels. Air districts may adopt additional more stringent requirements than those required by state law, including requirements for toxic air contaminants. (Health & Saf. Code § 41508; *Western Oil & Gas Assn. v. Monterey Bay Unified APCD* (1989) 49 Cal.3d 408, 414.) For example, SCAQMD has adopted a rule requiring new or modified sources to keep their risks below specified levels and use best available control technology (BACT) for toxics. (SCAQMD, *Rule 1401-New Source Review of Toxic Air Contaminants*, <http://www.aqmd.gov/home/regulations/rules/scaqmd-rule-book/regulation-xiv>; then follow “Rule 1401” hyperlink (last visited Apr. 1, 2015).)

## **B. The SCAQMD's Role Under CEQA**

The California Environmental Quality Act (CEQA) requires public agencies to perform an environmental review and appropriate analysis for projects that they implement or approve. (Pub. Resources Code § 21080(a).) The agency with primary approval authority for a particular project is generally the “lead agency” that prepares the appropriate CEQA document. (CEQA Guidelines §§ 15050, 15051.) Other agencies having a subsequent approval authority over all or part of a project are called “responsible” agencies that must determine whether the CEQA document is adequate for their use. (CEQA Guidelines §§ 15096(c), 15381.) Lead agencies must also consult with and circulate their environmental impact reports to “trustee agencies” and agencies “with jurisdiction by law” including “authority over resources which may be affected by the project.” (Pub. Resources Code §§ 21104(a), 21153; CEQA Guidelines §§ 15086(a)(3), 15073(c).) The SCAQMD has a role in all these aspects of CEQA.

Fulfilling its responsibilities to implement its air quality plan and adopt rules to attain the national ambient air quality standards, SCAQMD adopts a dozen or more rules each year to require pollution reductions from a wide variety of sources. The SCAQMD staff evaluates each rule for any adverse environmental impact and prepares the appropriate CEQA document. Although most rules reduce air emissions, they may have secondary environmental impacts such as use of water or energy or disposal of waste—e.g., spent catalyst from control equipment.<sup>3</sup>

---

<sup>3</sup> The SCAQMD's CEQA program for its rules is a “Certified Regulatory Program” under which it prepares a “functionally equivalent” document in lieu of a negative declaration or EIR. (Pub. Resources Code § 21080.5, CEQA Guidelines § 15251(l).)

The SCAQMD also approves a large number of permits every year to construct new, modified, or replacement facilities that emit regulated air pollutants. The majority of these air pollutant sources have already been included in an earlier CEQA evaluation for a larger project, are currently being evaluated by a local government as lead agency, or qualify for an exemption. However, the SCAQMD sometimes acts as lead agency for major projects where the local government does not have a discretionary approval. In such cases, SCAQMD prepares and certifies a negative declaration or environmental impact report (EIR) as appropriate.<sup>4</sup> SCAQMD evaluates perhaps a dozen such permit projects under CEQA each year. SCAQMD is often also a “responsible agency” for many projects since it must issue a permit for part of the projects (e.g., a boiler used to provide heat in a commercial building). For permit projects evaluated by another lead agency under CEQA, SCAQMD has the right to determine that the CEQA document is inadequate for its purposes as a responsible agency, but it may not do so because its permit program already requires all permitted sources to use the best available air pollution control technology. (SCAQMD, *Rule 1303(a)(1) – Requirements*, <http://www.aqmd.gov/home/regulations/rules/scaqmd-rule-book/regulation-xiii>; then follow “Rule 1303” hyperlink (last visited Apr. 1, 2015).)

Finally, SCAQMD receives as many as 60 or more CEQA documents each month (around 500 per year) in its role as commenting agency or an agency with “jurisdiction by law” over air quality—a natural resource affected by the project. (Pub. Resources Code §§ 21104(a), 21153; CEQA Guidelines § 15366(a)(3).) The SCAQMD staff provides comments on as many as 25 or 30 such documents each month.

---

<sup>4</sup> The SCAQMD's permit projects are not included in its Certified Regulatory Program, and are evaluated under the traditional local government CEQA analysis. (Pub. Resources Code §§ 21150-21154.)

(SCAQMD Governing Board Agenda, Apr. 3, 2015, Agenda Item 16, Attachment A, <http://www.aqmd.gov/home/library/meeting-agendas-minutes/agenda?title=governing-board-meeting-agenda-april-3-2015>; then follow “16. Lead Agency Projects and Environmental Documents Received by SCAQMD” hyperlink (last visited Apr. 1, 2015).) Of course, SCAQMD focuses its commenting efforts on the more significant projects.

Typically, SCAQMD comments on the adequacy of air quality analysis, appropriateness of assumptions and methodology, and completeness of the recommended air quality mitigation measures. Staff may comment on the need to prepare a health risk assessment detailing the projected cancer and noncancer risks from toxic air contaminants resulting from the project, particularly the impacts of diesel particulate matter, which CARB has identified as a toxic air contaminant based on its carcinogenic effects. (California Air Resources Board, Resolution 98-35, Aug. 27, 1998, <http://www.arb.ca.gov/regact/diesltac/diesltac.htm>; then follow Resolution 98-35 hyperlink (last visited Apr. 1, 2015).) Because SCAQMD already requires new or modified stationary sources of toxic air contaminants to use the best available control technology for toxics and to keep their risks below specified levels, (SCAQMD Rule 1401, *supra*, note 15), the greatest opportunity to further mitigate toxic impacts through the CEQA process is by reducing emissions—particularly diesel emissions—from vehicles.

**II. THIS COURT SHOULD NOT SET A HARD-AND-FAST RULE CONCERNING THE EXTENT TO WHICH AN EIR MUST CORRELATE A PROJECT’S EMISSION OF POLLUTANTS WITH RESULTING HEALTH IMPACTS.**

Numerous cases hold that courts do not review the correctness of an EIR’s conclusions but rather its sufficiency as an informative document. (*Laurel Heights 1*, *supra*, 47 Cal.3d at p. 392; *Citizens of Goleta Valley v.*

*Bd. of Supervisors* (1990) 52 Cal.3d 553, 569; *Bakersfield Citizens for Local Control v. City of Bakersfield* (2004) 124 Cal.App.4th 1184, 1197.)

As stated by the Court of Appeal in this case, where an EIR has addressed a topic, but the petitioner claims that the information provided about that topic is insufficient, courts must “draw[] a line that divides *sufficient* discussions from those that are *insufficient*.” (*Sierra Club v. County of Fresno* (2014) 226 Cal.App.4th 704 (superseded by grant of review) 172 Cal.Rptr.3d 271, 290.) The Court of Appeal readily admitted that “[t]he terms themselves – sufficient and insufficient – provide little, if any, guidance as to where the line should be drawn. They are simply labels applied once the court has completed its analysis.” (*Id.*)

The CEQA Guidelines, however, provide guidance regarding what constitutes a sufficient discussion of impacts. Section 15151 states that “the sufficiency of an EIR is to be reviewed in light of what is reasonably feasible.” Case law reflects this: “Analysis of environmental effects need not be exhaustive, but will be judged in light of what was reasonably feasible.” (*Association of Irrigated Residents v. County of Madera, supra*, 107 Cal.App.4th at p. 1390; see also CEQA Guidelines § 15204(a).)

Applying this test, this Court cannot realistically establish a hard-and-fast rule that an analysis correlating air pollution impacts of a project to quantified resulting health impacts is always required, or indeed that it is never required. Simply put, in some cases such an analysis will be “feasible”; in some cases it will not.

For example, air pollution control districts often require a proposed new source of toxic air contaminants to prepare a “health risk assessment” before issuing a permit to construct. District rules often limit the allowable cancer risk the new source may cause to the “maximally exposed individual” (worker and residence exposures). (*See, e.g.*, SCAQMD Rule 1401(c)(8); 1401(d)(1), *supra* note 15.) In order to perform this analysis, it

is necessary to have data regarding the sources and types of air toxic contaminants, location of emission points, velocity of emissions, the meteorology and topography of the area, and the location of receptors (worker and residence). (SCAQMD, *Supplemental Guidelines for Preparing Risk Assessments for the Air Toxics "Hot Spots" Information and Assessment Act (AB2588)*, pp. 11-16; (last visited Apr. 1, 2015) <http://www.aqmd.gov/home/library/documents-support-material>; "Guidelines" hyperlink; AB2588; then follow AB2588 Risk Assessment Guidelines hyperlink.)

Thus, it is feasible to determine the health risk posed by a new gas station locating at an intersection in a mixed use area, where receptor locations are known. On the other hand, it may not be feasible to perform a health risk assessment for airborne toxics that will be emitted by a generic industrial building that was built on "speculation" (i.e., without knowing the future tenant(s)). Even where a health risk assessment can be prepared, however, the resulting maximum health risk value is only a calculation of risk—it does not necessarily mean anyone will contract cancer as a result of the project.

In order to find the "cancer burden" or expected additional cases of cancer resulting from the project, it is also necessary to know the numbers and location of individuals living within the "zone of impact" of the project: i.e., those living in areas where the projected cancer risk from the project exceeds one in a million. (SCAQMD, Health Risk Assessment Summary form, <http://www.aqmd.gov/home/forms>; filter by "AB2588" category; then "Health Risk Assessment" hyperlink (last visited Apr. 1, 2015).) The affected population is divided into bands of those exposed to at least 1 in a million risk, those exposed to at least 10 in a million risk, etc. up to those exposed at the highest levels. (*Id.*) This data allows agencies to calculate an approximate number of additional cancer cases expected from

the project. However, it is not possible to predict which particular individuals will be affected.

For the so-called criteria pollutants<sup>5</sup>, such as ozone, it may be more difficult to quantify health impacts. Ozone is formed in the atmosphere from the chemical reaction of the nitrogen oxides (NO<sub>x</sub>) and volatile organic compounds (VOC) in the presence of sunlight. (U.S. EPA, Ground Level Ozone, <http://www.epa.gov/airquality/ozonepollution/> (last updated Mar. 25, 2015).) It takes time and the influence of meteorological conditions for these reactions to occur, so ozone may be formed at a distance downwind from the sources. (U.S. EPA, *Guideline on Ozone Monitoring Site Selection* (Aug. 1998) EPA-454/R-98-002 § 5.1.2, <http://www.epa.gov/ttnamti1/archive/cpreldoc.html> (last visited Apr. 1, 2015).) NO<sub>x</sub> and VOC are known as “precursors” of ozone.

Scientifically, health effects from ozone are correlated with increases in the ambient level of ozone in the air a person breathes. (U.S. EPA, *Health Effects of Ozone in the General Population*, Figure 9, <http://www.epa.gov/apti/ozonehealth/population.html#levels> (last visited Apr. 1, 2015).) However, it takes a large amount of additional precursor emissions to cause a modeled increase in ambient ozone levels over an entire region. For example, the SCAQMD's 2012 AQMP showed that reducing NO<sub>x</sub> by 432 tons per day (157,680 tons/year) and reducing VOC by 187 tons per day (68,255 tons/year) would reduce ozone levels at the SCAQMD's monitor site with the highest levels by only 9 parts per billion. (South Coast Air Quality Management District, *Final 2012 AQMP (February 2013)*, <http://www.aqmd.gov/home/library/clean-air-plans/air-quality-mgt-plan/final-2012-air-quality-management-plan>; then follow “Appendix V: Modeling & Attainment Demonstrations” hyperlink,

---

<sup>5</sup> See discussion of types of pollutants, *supra*, Part I.A.

pp. v-4-2, v-7-4, v-7-24.) SCAQMD staff does not currently know of a way to accurately quantify ozone-related health impacts caused by NO<sub>x</sub> or VOC emissions from relatively small projects.

On the other hand, this type of analysis may be feasible for projects on a regional scale with very high emissions of NO<sub>x</sub> and VOCs, where impacts are regional. For example, in 2011 the SCAQMD performed a health impact analysis in its CEQA document for proposed Rule 1315, which authorized various newly-permitted sources to use offsets from the districts “internal bank” of emission reductions. This CEQA analysis accounted for essentially *all* the increases in emissions due to new or modified sources in the District between 2010 and 2030.<sup>6</sup> The SCAQMD was able to correlate this very large emissions increase (e.g., 6,620 pounds per day NO<sub>x</sub> (1,208 tons per year), 89,180 pounds per day VOC (16,275 tons per year)) to expected health outcomes from ozone and particulate matter (e.g., 20 premature deaths per year and 89,947 school absences in the year 2030 due to ozone).<sup>7</sup> (SCAQMD Governing Board Agenda, February 4, 2011, Agenda Item 26, *Assessment for: Re-adoption of Proposed Rule 1315 – Federal New Source Review Tracking System* (see hyperlink in fn 6) at p. 4.1-35, Table 4.1-29.)

---

<sup>6</sup> (SCAQMD Governing Board Agenda, February 4, 2011, Agenda Item 26, Attachment G, *Assessment for: Re-adoption of Proposed Rule 1315 – Federal New Source Review Tracking System, Vol. 1, p.4.0-6*, <http://www.aqmd.gov/home/library/meeting-agendas-minutes/agenda?title=governing-board-meeting-agenda-february-4-2011>; the follow “26. Adopt Proposed Rule 1315 – Federal New Source Review Tracking System” (last visited April 1, 2015).)

<sup>7</sup> The SCAQMD was able to establish the location of future NO<sub>x</sub> and VOC emissions by assuming that new projects would be built in the same locations and proportions as existing stationary sources. This CEQA document was upheld by the Los Angeles County Superior Court in *Natural Res. Def. Council v SCAQMD*, Los Angeles Superior Court No. BS110792).

However, a project emitting only 10 tons per year of NO<sub>x</sub> or VOC is small enough that its regional impact on ambient ozone levels may not be detected in the regional air quality models that are currently used to determine ozone levels. Thus, in this case it would not be feasible to directly correlate project emissions of VOC or NO<sub>x</sub> with specific health impacts from ozone. This is in part because ozone formation is not linearly related to emissions. Ozone impacts vary depending on the location of the emissions, the location of other precursor emissions, meteorology and seasonal impacts, and because ozone is formed some time later and downwind from the actual emission. (EPA Guideline on Ozone Monitoring Site Selection (Aug. 1998) EPA-454/R-98-002, § 5.1.2; <https://www.epa.gov/ttnamti1/archive/cpreldoc.html>; then search “Guideline on Ozone Monitoring Site Selection” click on pdf) (last viewed Apr. 1, 2015).)

SCAQMD has set its CEQA “significance” threshold for NO<sub>x</sub> and VOC at 10 tons per year (expressed as 55 lb/day). (SCAQMD, *Air Quality Analysis Handbook*, <http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook>; then follow “SCAQMD Air Quality Significance Thresholds” hyperlink (last visited Apr. 1, 2015).) This is because the federal Clean Air Act defines a “major” stationary source for “extreme” ozone nonattainment areas such as SCAQMD as one emitting 10 tons/year. (42 U.S.C. §§ 7511a(e), 7511a(f); CAA §§ 182(e), 182(f).) Under the Clean Air Act, such sources are subject to enhanced control requirements (42 U.S.C. §§ 7502(c)(5), 7503; CAA §§ 172(c)(5), 173), so SCAQMD decided this was an appropriate threshold for making a CEQA “significance” finding and requiring feasible mitigation. Essentially, SCAQMD takes the position that a source that emits 10 tons/year of NO<sub>x</sub> or VOC would contribute cumulatively to ozone formation. Therefore, lead agencies that use SCAQMD’s thresholds of significance may determine

that many projects have “significant” air quality impacts and must apply all feasible mitigation measures, yet will not be able to precisely correlate the project to quantifiable health impacts, unless the emissions are sufficiently high to use a regional modeling program.

In the case of particulate matter (PM<sub>2.5</sub>)<sup>8</sup>, another “criteria” pollutant, SCAQMD staff is aware of two possible methods of analysis. SCAQMD used regional modeling to predict expected health impacts from its proposed Rule 1315, as mentioned above. Also, the California Air Resources Board (CARB) has developed a methodology that can predict expected mortality (premature deaths) from large amounts of PM<sub>2.5</sub>. (California Air Resources Board, *Health Impacts Analysis: PM Premature Death Relationship*, [http://www.arb.ca.gov/research/health/pm-mort/pm-mort\\_arch.htm](http://www.arb.ca.gov/research/health/pm-mort/pm-mort_arch.htm) (last reviewed Jan. 19, 2012).) SCAQMD used the CARB methodology to predict impacts from three very large power plants (e.g., 731-1837 lbs/day). (Final Environmental Assessment for Rule 1315, *supra*, pp 4.0-12, 4.1-13, 4.1-37 (e.g., 125 premature deaths in the entire SCAQMD in 2030), 4.1-39 (0.05 to 1.77 annual premature deaths from power plants.) Again, this project involved large amounts of additional PM<sub>2.5</sub> in the District, up to 2.82 tons/day (5,650 lbs/day of PM<sub>2.5</sub>, or, or 1029 tons/year. (*Id.* at table 4.1-4, p. 4.1-10.)

However, the primary author of the CARB methodology has reported that this PM<sub>2.5</sub> health impact methodology is not suited for small projects and may yield unreliable results due to various uncertainties.<sup>9</sup> (SCAQMD, *Final Subsequent Mitigated Negative Declaration for: Warren*

---

<sup>8</sup> SCAQMD has not attained the latest annual or 24-hour national ambient air quality standards for “PM<sub>2.5</sub>” or particulate matter less than 2.5 microns in diameter.

<sup>9</sup> Among these uncertainties are the representativeness of the population used in the methodology, and the specific source of PM and the corresponding health impacts. (*Id.* at p. 2-24.)

*E&P, Inc. WTU Central Facility, New Equipment Project* (certified July 19, 2011), <http://www.aqmd.gov/home/library/documents-support-material/lead-agency-permit-projects/permit-project-documents---year-2011>; then follow “Final Subsequent Mitigated Negative Declaration for Warren E&P Inc. WTU Central Facility, New Equipment Project” hyperlink, pp. 2-22, 2-23 (last visited Apr. 1, 2015).) Therefore, when SCAQMD prepared a CEQA document for the expansion of an existing oil production facility, with very small PM<sub>2.5</sub> increases (3.8 lb/day) and a very small affected population, staff elected not to use the CARB methodology for using estimated PM<sub>2.5</sub> emissions to derive a projected premature mortality number and explained why it would be inappropriate to do so. (*Id.* at pp 2-22 to 2-24.) SCAQMD staff concluded that use of this methodology for such a small source could result in unreliable findings and would not provide meaningful information. (*Id.* at pp. 2-23, 2-25.) This CEQA document was not challenged in court.

In the above case, while it may have been technically possible to plug the data into the methodology, the results would not have been reliable or meaningful. SCAQMD believes that an agency should not be required to perform analyses that do not produce reliable or meaningful results. This Court has already held that an agency may decline to use even the “normal” “existing conditions” CEQA baseline where to do so would be misleading or without informational value. (*Neighbors for Smart Rail v. Exposition Metro Line* (2013) 57 Cal.4th 439, 448, 457.) The same should be true for a decision that a particular study or analysis would not provide reliable or meaningful results.<sup>10</sup>

---

<sup>10</sup> Whether a particular study would result in “informational value” is a part of deciding whether it is “feasible.” CEQA defines “feasible” as “capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, social, and

Therefore, it is not possible to set a hard-and-fast rule on whether a correlation of air quality impacts with specific quantifiable health impacts is required in all cases. Instead, the result turns on whether such an analysis is reasonably feasible in the particular case.<sup>11</sup> Moreover, what is reasonably feasible may change over time as scientists and regulatory agencies continually seek to improve their ability to predict health impacts. For example, CARB staff has been directed by its Governing Board to reassess and improve the methodology for estimating premature deaths. (California Air Resources Board, *Health Impacts Analysis: PM Mortality Relationship*, <http://www.arb.ca.gov/research/health/pm-mort/pm-mort.htm> (last reviewed Dec. 29, 2010).) This factor also counsels against setting any hard-and-fast rule in this case.

### **III. THE QUESTION OF WHETHER AN EIR CONTAINS SUFFICIENT ANALYSIS TO MEET CEQA'S REQUIREMENTS IS A MIXED QUESTION OF FACT AND LAW GOVERNED BY TWO DIFFERENT STANDARDS OF REVIEW.**

#### **A. Standard of Review for Feasibility Determination and Sufficiency as an Informative Document**

A second issue in this case is whether courts should review an EIR's informational sufficiency under the "substantial evidence" test as argued by Friant Ranch or the "independent judgment" test as argued by Sierra Club.

---

technological factors." (Pub. Resources Code § 21061.1.) A study cannot be "accomplished in a *successful* manner" if it produces unreliable or misleading results.

<sup>11</sup> In this case, the lead agency did not have an opportunity to determine whether the requested analysis was feasible because the comment was non-specific. Therefore, SCAQMD suggests that this Court, after resolving the legal issues in the case, direct the Court of Appeal to remand the case to the lead agency for a determination of whether the requested analysis is feasible. Because Fresno County, the lead agency, did not seek review in this Court, it seems likely that the County has concluded that at least some level of correlation of air pollution with health impacts is feasible.

As this Court has explained, “a reviewing court must adjust its scrutiny to the nature of the alleged defect, depending on whether the claim is predominantly one of improper procedure or a dispute over the facts.” (*Vineyard Area Citizens v. City of Rancho Cordova, supra*, 40 Cal.4th at 435.) For questions regarding compliance with proper procedure or other legal questions, courts review an agency’s action de novo under the “independent judgment” test. (*Id.*) On the other hand, courts review factual disputes only for substantial evidence, thereby “accord[ing] greater deference to the agency’s substantive factual conclusions.” (*Id.*)

Here, Friant Ranch and Sierra Club agree that the case involves the question of whether an EIR includes sufficient information regarding a project’s impacts. However, they disagree on the proper standard of review for answering this question: Sierra Club contends that courts use the independent judgment standard to determine whether an EIR’s analysis is sufficient to meet CEQA’s informational purposes,<sup>12</sup> while Friant Ranch contends that the substantial evidence standard applies to this question.

///  
///  
///  
///  
///  
///  
///  
///  
///  
///

---

<sup>12</sup> Sierra Club acknowledges that courts use the substantial evidence standard when reviewing predicate factual issues, but argues that courts ultimately decide as a matter of law what CEQA requires. (Answering Brief, pp. 14, 23.)

SCAQMD submits that the issue is more nuanced than either party contends. We submit that, whether a CEQA document includes sufficient analysis to satisfy CEQA's informational mandates is a mixed question of fact and law,<sup>13</sup> containing two levels of inquiry that should be judged by different standards.<sup>14</sup>

The state CEQA Guidelines set forth standards for the adequacy of environmental analysis. Guidelines Section 15151 states:

An EIR should be prepared with a sufficient degree of analysis to provide decision makers with information which enables them to make a decision which intelligently takes account of environmental consequences. An evaluation of the environmental effects of a proposed project need not be exhaustive, but the sufficiency of an EIR is to be reviewed in light of what is reasonably feasible. Disagreement among experts does not make an EIR inadequate, but the EIR should summarize the main points of disagreement among the experts. The courts have looked not for perfection, but for adequacy, completeness, and a good-faith effort at full disclosure.

In this case, the basic question is whether the underlying analysis of air quality impacts made the EIR "sufficient" as an informative document. However, whether the EIR's analysis was sufficient is judged in light of what was reasonably feasible. This represents a mixed question of fact and law that is governed by two different standards of review.

---

<sup>13</sup> Friant Ranch actually states that the claim that an EIR lacks sufficient relevant information is, "most properly thought of as raising mixed questions of fact and law." (Opening Brief, p. 27.) However, the remainder of its argument claims that the court should apply the substantial evidence standard of review to all aspects of the issue.

<sup>14</sup> Mixed questions of fact and law issues may implicate predominantly factual subordinate questions that are reviewed under the substantial evidence test even though the ultimate question may be reviewed by the independent judgment test. *Crocker National Bank v. City and County of San Francisco* (1989) 49 Cal.3d 881, 888-889.

SCAQMD submits that an EIR's sufficiency as an informational document is ultimately a legal question that courts should determine using their independent judgment. This Court's language in *Laurel Heights I* supports this position. As this Court explained: "The court does not pass upon the correctness of the EIR's environmental conclusions, but only upon its *sufficiency as an informative document*." (*Laurel Heights I, supra*, 47 Cal.3d at 392-393) (emphasis added.) As described above, the Court in *Vineyard Area Citizens v. City of Rancho Cordova, supra*, 40 Cal.4th at 431, also used its independent judgment to determine what level of analysis CEQA requires for water supply impacts. The Court did not defer to the lead agency's opinion regarding the law's requirements; rather, it determined for itself what level of analysis was necessary to meet "[t]he law's informational demands." (*Id.* at p. 432.) Further, existing case law also holds that where an agency fails to comply with CEQA's information disclosure requirements, the agency has "failed to proceed in the manner required by law." (*Save Our Peninsula Comm. v. Monterey County Bd. of Supervisors* (2001) 87 Cal.App.4th 99, 118.)

However, whether an EIR satisfies CEQA's requirements depends in part on whether it was reasonably feasible for an agency to conduct additional or more thorough analysis. EIRs must contain "a detailed statement" of a project's impacts (Pub. Res. Code § 21061), and an agency must "use its best efforts to find out and disclose all that it reasonably can." (CEQA Guidelines § 15144.) Nevertheless, "the sufficiency of an EIR is to be reviewed in light of what is reasonably feasible." (CEQA Guidelines § 15151.)

SCAQMD submits that the question of whether additional analysis or a particular study suggested by a commenter is "feasible" is generally a question of fact. Courts have already held that whether a particular alternative is "feasible" is reviewed by the substantial evidence test.

(*Uphold Our Heritage v. Town of Woodside* (2007) 147 Cal.App.4th 587, 598-99; *Center for Biological Diversity v. County of San Bernardino* (2010) 185 Cal.App.4th 866, 883.) Thus, if a lead agency determines that a particular study or analysis is infeasible, that decision should generally be judged by the substantial evidence standard. However, SCAQMD urges this Court to hold that lead agencies must explain the basis of any determination that a particular analysis is infeasible in the EIR itself. An EIR must discuss information, including issues related to the feasibility of particular analyses “in sufficient detail to enable meaningful participation and criticism by the public. ‘[W]hatever is required to be considered in an EIR must be in that formal report; what any official might have known from other writings or oral presentations cannot supply what is lacking in the report.’” (*Laurel Heights I, supra*, 47 Cal.3d at p. 405 (quoting *Santiago County Water District v. County of Orange* (1981) 118 Cal.App.3d 818, 831) (discussing analysis of alternatives).) The evidence on which the determination is based should also be summarized in the EIR itself, with appropriate citations to reference materials if necessary. Otherwise commenting agencies such as SCAQMD would be forced to guess where the lead agency's evidence might be located, thus thwarting effective public participation.

Moreover, if a lead agency determines that a particular study or analysis would not result in reliable or useful information and for that reason is not feasible, that determination should be judged by the substantial evidence test. (See *Neighbors for Smart Rail v. Exposition Metro Line Construction Authority, supra*, 57 Cal.4th 439, 448, 457:

whether “existing conditions” baseline would be misleading or uninformative judged by substantial evidence standard.<sup>15</sup>)

If the lead agency’s determination that a particular analysis or study is not feasible is supported by substantial evidence, then the agency has not violated CEQA’s information disclosure provisions, since it would be infeasible to provide additional information. This Court’s decisions provide precedent for such a result. For example, this Court determined that the issue of whether the EIR should have included a more detailed discussion of future herbicide use was resolved because substantial evidence supported the agency’s finding that “the precise parameters of future herbicide use could not be predicted.” *Ebbetts Pass Forest Watch v. California Dept. of Forestry & Fire Protection* (2008) 43 Cal.4th 936, 955.

Of course, SCAQMD expects that courts will continue to hold lead agencies to their obligations to consult with, and not to ignore or misrepresent, the views of sister agencies having special expertise in the area of air quality. (*Berkeley Keep Jets Over the Bay v. Board of Port Commissioners* (2007) 91 Cal.App.4<sup>th</sup> 1344, 1364 n.11.) In some cases, information provided by such expert agencies may establish that the purported evidence relied on by the lead agency is not in fact “substantial”. (*Id.* at pp. 1369-1371.)

In sum, courts retain ultimate responsibility to determine what CEQA requires. However, the law does not require exhaustive analysis, but only what is reasonably feasible. Agencies deserve deference for their factual determinations regarding what type of analysis is reasonably feasible. On the other hand, if a commenter requests more information, and the lead agency declines to provide it but does *not* determine that the

---

<sup>15</sup> The substantial evidence standard recognizes that the courts "have neither the resources nor the scientific expertise" to weigh conflicting evidence on technical issues. (*Laurel Heights I, supra*, 47 Cal.3d 376, 393.)

requested study or analysis would be infeasible, misleading or uninformative, the question becomes whether the omission of that analysis renders the EIR inadequate to satisfy CEQA's informational purposes. (*Id.* at pp. 1370-71.) Again, this is predominantly a question of law and should be judged by the de novo or independent judgment standard of review. Of course, this Court has recognized that a "project opponent or reviewing court can always imagine some additional study or analysis that might provide helpful information. It is not for them to design the EIR. That further study...might be helpful does not make it necessary." (*Laurel Heights I, supra*, 47 Cal.3d 376, 415 – see also CEQA Guidelines § 15204(a) [CEQA "does not require a lead agency to conduct every test. . . recommended or demanded by commenters."].) Courts, then, must adjudicate whether an omission of particular information renders an EIR inadequate to serve CEQA's informational purposes.<sup>16</sup>

---

<sup>16</sup> We recognize that there is case law stating that the substantial evidence standard applies to "challenges to the scope of an EIR's analysis of a topic" as well as the methodology used and the accuracy of the data relied on in the document "because these types of challenges involve factual questions." (*Bakersfield Citizens for Local Control v. City of Bakersfield, supra*, 124 Cal.App.4<sup>th</sup> 1184, 1198, and cases relied on therein.) However, we interpret this language to refer to situations where the question of the scope of the analysis really is factual—that is, where it involves whether further analysis is feasible, as discussed above. This interpretation is supported by the fact that the *Bakersfield* court expressly rejected an argument that a claimed "omission of information from the EIR should be treated as inquiries whether there is substantial evidence supporting the decision approving the project." *Bakersfield, supra*, 124 Cal.App.4<sup>th</sup> at p. 1208. And the *Bakersfield* court ultimately decided that the lead agency must analyze the connection between the identified air pollution impacts and resulting health impacts, even though the EIR already included some discussion of air-pollution-related respiratory illnesses. *Bakersfield, supra*, 124 Cal.App.4<sup>th</sup> at p. 1220. Therefore, the court must not have interpreted this question as one of the "scope of the analysis" to be judged by the substantial evidence standard.

**B. Friant Ranch's Rationale for Rejecting the Independent Judgment Standard of Review is Unsupported by Case Law.**

In its brief, Friant Ranch makes a distinction between cases where a required CEQA topic is not discussed at all (to be reviewed by independent judgment as a failure to proceed in the manner required by law) and cases where a topic is discussed, but the commenter claims the information provided is insufficient (to be judged by the substantial evidence test). (Opening Brief, pp. 13-17.) The Court of Appeal recognized these two types of cases, but concluded that both raised questions of law. (*Sierra Club v. County of Fresno* (2014) 226 Cal.App.4th 704 (superseded by grant of review) 172 Cal.Rptr.3d 271, 290.) We believe the distinction drawn by Friant Ranch is unduly narrow, and inconsistent with cases which have concluded that CEQA documents are insufficient. In many instances, CEQA's requirements are stated broadly, and the courts must interpret the law to determine what level of analysis satisfies CEQA's mandate for providing meaningful information, even though the EIR discusses the issue to some extent.

For example, the CEQA Guidelines require discussion of the existing environmental baseline. In *County of Amador v. El Dorado County Water Agency* (1999) 76 Cal.App.4th 931, 954-955, the lead agency had discussed the environmental baseline by describing historic month-end water levels in the affected lakes. However, the court held that this was not an adequate baseline discussion because it failed to discuss the timing and amounts of past actual water releases, to allow comparison with the proposed project. The court evidently applied the independent judgment test to its decision, even though the agency discussed the issue to some extent.

Likewise, in *Vineyard Area Citizens* (2007) 40 Cal.4th 412, this Court addressed the question of whether an EIR's analysis of water supply impacts complied with CEQA. The parties agreed that the EIR was required to analyze the effects of providing water to the development project, "and that in order to do so the EIR had, in some manner, to identify the planned sources of that water." (*Vineyard Area Citizens, supra*, at p. 428.) However, the parties disagreed as to the level of detail required for this analysis and "what level of uncertainty regarding the availability of water supplies can be tolerated in an EIR . . . ." (*Id.*) In other words, the EIR had analyzed water supply impacts for the project, but the petitioner claimed that the analysis was insufficient.

This Court noted that neither CEQA's statutory language or the CEQA Guidelines specifically addressed the question of how precisely an EIR must discuss water supply impacts. (*Id.*) However, it explained that CEQA "states that '[w]hile foreseeing the unforeseeable is not possible, an agency must use its best efforts to find out and disclose all that it reasonably can.'" (*Id.*, [Guidelines § 15144].) The Court used this general principle, along with prior precedent, to elucidate four "principles for analytical adequacy" that are necessary in order to satisfy "CEQA's informational purposes." (*Vineyard Area Citizens, supra*, at p. 430.) The Court did not defer to the agency's determination that the EIR's analysis of water supply impacts was sufficient. Rather, this Court used its independent judgment to determine for itself the level of analysis required to satisfy CEQA's fundamental purposes. (*Vineyard Area Citizens, supra*, at p. 441: an EIR does not serve its purposes where it neglects to explain likely sources of water and "... leaves long term water supply considerations to later stages of the project.")

Similarly, the CEQA Guidelines require an analysis of noise impacts of the project. (Appendix G, “Environmental Checklist Form.”<sup>17</sup>) In *Gray v. County of Madera* (2008) 167 Cal.App.4th 1099, 1123, the court held that the lead agency’s noise impact analysis was inadequate even though it had addressed the issue and concluded that the increase would not be noticeable. If the court had been using the substantial evidence standard, it likely would have upheld this discussion.

Therefore, we do not agree that the issue can be resolved on the basis suggested by Friant Ranch, which would apply the substantial evidence standard to *every* challenge to an analysis that addresses a required CEQA topic. This interpretation would subvert the courts’ proper role in interpreting CEQA and determining what the law requires.

Nor do we agree that the Court of Appeal in this case violated CEQA’s prohibition on courts interpreting its provisions “in a manner which imposes procedural or substantive requirements beyond those explicitly stated in this division or in the state guidelines.” (Pub. Resources Code § 21083.1.) CEQA requires an EIR to describe *all* significant impacts of the project on the environment. (Pub. Resources Code § 21100(b)(2); *Vineyard Area Citizens, supra*, at p. 428.) Human beings are part of the environment, so CEQA requires EIRs to discuss a project’s significant impacts on human health. However, except in certain particular circumstances,<sup>18</sup> neither the CEQA statute nor Guidelines specify the precise level of analysis that agencies must undertake to satisfy the law’s requirements. (see, e.g., CEQA Guidelines § 15126.2(a) [EIRs must describe “health and safety problems caused by {a project’s} physical changes”].) Accordingly, courts must interpret CEQA as a whole to

---

<sup>17</sup> Association of Environmental Professionals, 2015 CEQA Statute and Guidelines (2015) p.287.

<sup>18</sup> E.g., Pub. Resources Code § 21151.8(C)(3)(B)(iii) (requiring specific type of health risk analysis for siting schools).

determine whether a particular EIR is sufficient as an informational document. A court determining whether an EIR's discussion of human health impacts is legally sufficient does not constitute imposing a new substantive requirement.<sup>19</sup> Under Friant Ranch's theory, the above-referenced cases holding a CEQA analysis inadequate would have violated the law. This is not a reasonable interpretation.

#### **IV. COURTS MUST SCRUPULOUSLY ENFORCE THE REQUIREMENTS THAT LEAD AGENCIES CONSULT WITH AND OBTAIN COMMENTS FROM AIR DISTRICTS**

Courts must "scrupulously enforce" CEQA's legislatively mandated requirements. (*Vineyard Area Citizens, supra*, 40 Cal.4<sup>th</sup> 412, 435.) Case law has firmly established that lead agencies must consult with the relevant air pollution control district before conducting an initial study, and must provide the districts with notice of the intention to adopt a negative declaration (or EIR). (*Schenck v. County of Sonoma* (2011) 198 Cal.App.4th 949, 958.) As *Schenck* held, neither publishing the notice nor providing it to the State Clearinghouse was a sufficient substitute for sending notice directly to the air district. (*Id.*) Rather, courts "must be satisfied that [administrative] agencies have fully complied with the procedural requirements of CEQA, since only in this way can the important public purposes of CEQA be protected from subversion." *Schenck*, 198 Cal.App.4th at p. 959 (citations omitted).<sup>20</sup>

---

<sup>19</sup> We submit that Public Resources Code Section 21083.1 was intended to prevent courts from, for example, holding that an agency must analyze economic impacts of a project where there are no resulting environmental impacts (see CEQA Guidelines § 15131), or imposing new procedural requirements, such as imposing additional public notice requirements not set forth in CEQA or the Guidelines.

<sup>20</sup> Lead agencies must consult air districts, as public agencies with jurisdiction by law over resources affected by the project, *before* releasing an EIR. (Pub. Resources Code §§ 21104(a); 21153.) Moreover, air

Lead agencies should be aware, therefore, that failure to properly seek and consider input from the relevant air district constitutes legal error which may jeopardize their project approvals. For example, the court in *Fall River Wild Trout Foundation v. County of Shasta*, (1999) 70 Cal.App.4th 482, 492 held that the failure to give notice to a trustee agency (Department of Fish and Game) was prejudicial error requiring reversal. The court explained that the lack of notice prevented the Department from providing any response to the CEQA document. (*Id.* at p. 492.) It therefore prevented relevant information from being presented to the lead agency, which was prejudicial error because it precluded informed decision-making. (*Id.*)<sup>21</sup>

---

districts should be considered “state agencies” for purposes of the requirement to consult with “trustee agencies” as set forth in Public Resources Code § 20180.3(a). This Court has long ago held that the districts are not mere “local agencies” whose regulations are superseded by those of a state agency regarding matters of statewide concern, but rather have concurrent jurisdiction over such issues. (*Orange County Air Pollution Control District v. Public Util. Com.* (1971) 4 Cal.3d 945, 951, 954.) Since air pollution is a matter of statewide concern, *Id.* at 952, air districts should be entitled to trustee agency status in order to ensure that this vital concern is adequately protected during the CEQA process.

<sup>21</sup> In *Schenck*, the court concluded that failure to give notice to the air district was not prejudicial, but this was partly because the trial court had already corrected the error before the case arrived at the Court of Appeal. The trial court issued a writ of mandate requiring the lead agency to give notice to the air district. The air district responded by concurring with the lead agency that air impacts were not significant. (*Schenck*, 198 Cal.App.4th 949, 960.) We disagree with the *Schenck* court that the failure to give notice to the air district would not have been prejudicial (even in the absence of the trial court writ) merely because the lead agency purported to follow the air district’s published CEQA guidelines for significance. (*Id.*, 198 Cal.App.4th at p. 960.) In the first place, absent notice to the air district, it is uncertain whether the lead agency properly followed those guidelines. Moreover, it is not realistic to expect that an air district’s published guidelines would necessarily fully address all possible air-quality related issues that can arise with a CEQA project, or that those

Similarly, lead agencies must obtain additional information requested by expert agencies, including those with jurisdiction by law, if that information is necessary to determine a project's impacts. (*Sierra Club v. State Bd. Of Forestry* (1994) 7 Cal.4th 1215, 1236-37.) Approving a project without obtaining that information constitutes a failure to proceed in the manner prescribed by CEQA. (*Id.* at p. 1236.)

Moreover, a lead agency can save significant time and money by consulting with the air district early in the process. For example, the lead agency can learn what the air district recommends as an appropriate analysis on the facts of its case, including what kinds of health impacts analysis may be available, and what models are appropriate for use. This saves the lead agency from the need to do its analysis all over again and possibly needing to recirculate the document after errors are corrected, if new significant impacts are identified. (CEQA Guidelines § 15088.5(a).) At the same time, the air district's expert input can help the lead agency properly determine whether another commenter's request for additional analysis or studies is reasonable or feasible. Finally, the air district can provide input on what mitigation measures would be feasible and effective.

Therefore, we suggest that this Court provide guidance to lead agencies reminding them of the importance of consulting with the relevant air districts regarding these issues. Otherwise, their feasibility decisions may be vulnerable to air district evidence that establishes that there is no substantial evidence to support the lead agency decision not to provide specific analysis. (*See Berkeley Keep Jets Over the Bay, supra*, 91 Cal.App.4th 1344, 1369-1371.)

---

guidelines would necessarily be continually modified to reflect new developments. Therefore we believe that, had the trial court not already ordered the lead agency to obtain the air district's views, the failure to give notice would have been prejudicial, as in *Fall River, supra*, 70 Cal.App.4th 482, 492.

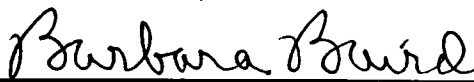

## CONCLUSION

The SCAQMD respectfully requests this Court *not* to establish a hard-and-fast rule concerning whether CEQA requires a lead agency to correlate identified air quality impacts of a project with resulting health outcomes. Moreover, the question of whether an EIR is “sufficient as an informational document” is a mixed question of fact and law containing two levels of inquiry. Whether a particular proposed analysis is feasible is predominantly a question of fact to be judged by the substantial evidence standard of review. Where the requested analysis is feasible, but the lead agency relies on legal or policy reasons not to provide it, the question of whether the EIR is nevertheless sufficient as an informational document is predominantly a question of law to be judged by the independent judgment standard of review.

Respectfully submitted,

## CERTIFICATE OF WORD COUNT

Pursuant to Rule 8.520(c)(1) of the California Rules of Court, I hereby certify that this brief contains 8,476 words, including footnotes, but excluding the Application, Table of Contents, Table of Authorities, Certificate of Service, this Certificate of Word Count, and signature blocks. I have relied on the word count of the Microsoft Word Vista program used to prepare this Certificate.

DATED: April 3, 2015

Respectfully submitted,

  
Barbara Baird

**PROOF OF SERVICE**

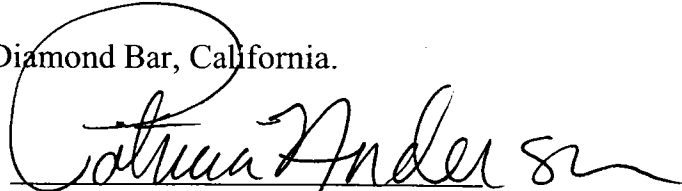

I am employed in the County of Los Angeles, California. I am over the age of 18 years and not a party to the within action. My business address is 21865 Copley Drive, Diamond Bar, California 91765.

On April 3, 2015 I served true copies of the following document(s) described as **APPLICATION OF THE SOUTH COAST AIR QUALITY MANAGEMENT DISTRICT FOR LEAVE TO FILE BRIEF OF *AMICUS CURIAE* IN SUPPORT OF NEITHER PARTY AND [PROPOSED] BRIEF OF *AMICUS CURIAE*** by placing a true copy of the foregoing document(s) in a sealed envelope addressed as set forth on the attached service list as follows:

**BY MAIL:** I enclosed the document(s) in a sealed envelope or package addressed to the persons at the addresses listed in the Service List and placed the envelope for collection and mailing following our ordinary business practices. I am readily familiar with this District's practice for collection and processing of correspondence for mailing. Under that practice, the correspondence would be deposited with the United States Postal Service, with postage thereon fully prepaid at Diamond Bar, California, in the ordinary course of business. I am aware that on motion of the party served, service is presumed invalid if postal cancellation date or postage meter date is more than one day after date of deposit for mailing in affidavit.

I declare under penalty of perjury under the laws of the State of California that the foregoing is true and correct.

Executed on April 3, 2015 at Diamond Bar, California.

  
Patricia Anderson

*Counsel for San Joaquin Valley Unified Air Pollution Control District*

## APPLICATION

Pursuant to California Rules of Court 8.520(f)(1), proposed Amicus Curiae San Joaquin Valley Unified Air Pollution Control District hereby requests permission from the Chief Justice to file an amicus brief in support of Defendant and Respondent, County of Fresno, and Defendant and Real Parties in Interest Friant Ranch, L.P. Pursuant to Rule 8.520(f)(5) of the California Rules of Court, the proposed amicus curiae brief is combined with this Application. The brief addresses the following issue certified by this Court for review:

Is an EIR adequate when it identifies the health impacts of air pollution and quantifies a project's expected emissions, or does CEQA further require the EIR to *correlate* a project's air quality emissions to specific health impacts?

As of the date of this filing, the deadline for the final reply brief on the merits was March 5, 2015. Accordingly, under Rule 8.520(f)(2), this application and brief are timely.

### **1. Background and Interest of San Joaquin Valley Unified Air Pollution Control District**

The San Joaquin Valley Unified Air Pollution Control District ("Air District") regulates air quality in the eight counties comprising the San Joaquin Valley ("Central Valley"): Kern, Tulare, Madera, Fresno, Merced, San Joaquin, Stanislaus, and Kings, and is primarily responsible for attaining air quality standards within its jurisdiction. After billions of dollars of investment by Central Valley businesses, pioneering air quality regulations, and consistent efforts by residents, the Central Valley air basin has made historic improvements in air quality.

The Central Valley's geographical, topographical and meteorological features create exceptionally challenging air quality

conditions. For example, it receives air pollution transported from the San Francisco Bay Area and northern Central Valley communities, and the southern portion of the Central Valley includes three mountain ranges (Sierra, Tehachapi, and Coastal) that, under some meteorological conditions, effectively trap air pollution. Central Valley air pollution is only a fraction of what the Bay Area and Los Angeles produce, but these natural conditions result in air quality conditions that are only marginally better than Los Angeles, even though about ten times more pollution is emitted in the Los Angeles region. Bay Area air quality is much better than the Central Valley's, even though the Bay Area produces about six times more pollution. The Central Valley also receives air pollution transported from the Bay Area and northern counties in the Central Valley, including Sacramento, and transboundary anthropogenic ozone from as far away as China.

Notwithstanding these challenges, the Central Valley has reduced emissions at the same or better rate than other areas in California and has achieved unparalleled milestones in protecting public health and the environment:

- In the last decade, the Central Valley became the first air basin classified by the federal government under the Clean Air Act as a “serious nonattainment” area to come into attainment of health-based National Ambient Air Quality Standard (“NAAQS”) for coarse particulate matter (PM10), an achievement made even more notable given the Valley’s extensive agricultural sector. Unhealthy levels of particulate matter can cause and exacerbate a range of chronic and acute illnesses.
- In 2013, the Central Valley became the first air basin in the country to improve from a federal designation of “extreme” nonattainment to

actually attain (and quality for an attainment designation) of the 1-hour ozone NAAQS; ozone creates “smog” and, like PM10, causes adverse health impacts.

- The Central Valley also is in full attainment of federal standards for lead, nitrogen dioxide, sulfur dioxide, and carbon monoxide.
- The Central Valley continues to make progress toward compliance with its last two attainment standards, with the number of exceedences for the 8-hour ozone NAAQS reduced by 74% (for the 1997 standard) and 38% (for the 2008 standard) since 1991, and for the small particulate matter (PM2.5) NAAQS reduced by 85% (for the 1997 standard) and 61% (for the 2006 standard).

Sustained improvement in Central Valley air quality requires a rigorous and comprehensive regulatory framework that includes prohibitions (e.g., on wood-burning fireplaces in new residences), mandates (e.g., requiring the installation of best available pollution reduction technologies on new and modified equipment and industrial operations), innovations (e.g., fees assessed against residential development to fund pollution reduction actions to “offset” vehicular emissions associated with new residences), incentive programs (e.g., funding replacements of older, more polluting heavy duty trucks and school buses)<sup>1</sup>, ongoing planning for continued air quality improvements, and enforcement of Air District permits and regulations.

The Air District is also an expert air quality agency for the eight counties and cities in the San Joaquin Valley. In that capacity, the Air District has developed air quality emission guidelines for use by the Central

---

<sup>1</sup> San Joaquin’s incentive program has been so successful that through 2012, it has awarded over \$ 432 million in incentive funds and has achieved 93,349 tons of lifetime emissions reductions. See SAN JOAQUIN VALLEY AIR POLLUTION CONTROL DISTRICT, 2012 PM2.5 PLAN, 6-6 (2012) available at <http://www.valleyair.org/Workshops/postings/2012/12-20-12PM25/FinalVersion/06%20Chapter%206%20Incentives.pdf>.

Valley counties and cities that implement the California Environment Quality Act (CEQA).<sup>2</sup> In its guidance, the Air District has distinguished between toxic air contaminants and criteria air pollutants.<sup>3</sup> Recognizing this distinction, the Air District's CEQA Guidance has adopted distinct thresholds of significance for *criteria* pollutants (i.e., ozone, PM2.5 and their respective precursor pollutants) based upon scientific and factual data which demonstrates the level that can be accommodated on a cumulative basis in the San Joaquin Valley without affecting the attainment of the applicable NAAQS.<sup>4</sup> For *toxic air* pollutants, the District has adopted different thresholds of significance which scientific and factual data demonstrates has the potential to expose sensitive receptors (i.e., children, the elderly) to levels which may result in localized health impacts.<sup>5</sup>

The Air District's CEQA Guidance was followed by the County of Fresno in its environment review of the Friant Ranch project, for which the Air District also served as a commenting agency. The Court of Appeal's holding, however, requiring correlation between the project's criteria

---

<sup>2</sup> See, e.g., SAN JOAQUIN VALLEY AIR POLLUTION CONTROL DISTRICT, PLANNING DIVISION, GUIDE FOR ASSESSING AND MITIGATING AIR QUALITY IMPACTS (2015), available at [http://www.valleyair.org/transportation/GAMAQI\\_3-19-15.pdf](http://www.valleyair.org/transportation/GAMAQI_3-19-15.pdf) ("CEQA Guidance").

<sup>3</sup> Toxic air contaminants, also known as hazardous air pollutants, are those pollutants that are known or suspected to cause cancer or other serious health effects, such as birth defects. There are currently 189 toxic air contaminants regulated by the United States Environmental Protection Agency ("EPA") and the states pursuant to the Clean Air Act. 42 U.S.C. § 7412. Common TACs include benzene, perchloroethylene and asbestos. *Id.* at 7412(b).

In contrast, there are only six (6) criteria air pollutants: ozone, particulate matter, carbon monoxide, nitrogen oxides, sulfur dioxide and lead. Although criteria air pollutants can also be harmful to human health, they are distinguishable from toxic air contaminants and are regulated separately. For instance, while criteria pollutants are regulated by numerous sections throughout Title I of the Clean Air Act, the regulation of toxic air contaminants occurs solely under section 112 of the Act. Compare 42 U.S.C. §§ 7407 – 7411 & 7501 – 7515 with 42 U.S.C. § 7411.

<sup>4</sup> See, e.g., CEQA Guidance at [http://www.valleyair.org/transportation/GAMAQI\\_3-19-15.pdf](http://www.valleyair.org/transportation/GAMAQI_3-19-15.pdf), pp. 64-66, 80.

<sup>5</sup> See, e.g., CEQA Guidance at [http://www.valleyair.org/transportation/GAMAQI\\_3-19-15.pdf](http://www.valleyair.org/transportation/GAMAQI_3-19-15.pdf), pp. 66, 99-101.

pollutants and local health impacts, departs from the Air District's Guidance and approved methodology for assessing criteria pollutants. A close reading of the administrative record that gave rise to this issue demonstrates that the Court's holding is based on a misunderstanding of the distinction between toxic air contaminants (for which a local health risk assessment is feasible and routinely performed) and criteria air pollutants (for which a local health risk assessment is not feasible and would result in speculative results).<sup>6</sup> The Air District has a direct interest in ensuring the lawfulness and consistent application of its CEQA Guidance, and will explain how the Court of Appeal departed from the Air District's long-standing CEQA Guidance in addressing criteria pollutants and toxic air contaminants in this amicus brief.

## **2. How the Proposed Amicus Curiae Brief Will Assist the Court**

As counsel for the proposed amicus curiae, we have reviewed the briefs filed in this action. In addition to serving as a "commentary agency" for CEQA purposes over the Friant Ranch project, the Air District has a strong interest in assuring that CEQA is used for its intended purpose, and believes that this Court would benefit from additional briefing explaining the distinction between criteria pollutants and toxic air contaminants and the different methodologies employed by local air pollution control agencies such as the Air District to analyze these two categories of air pollutants under CEQA. The Air District will also explain how the Court of Appeal's opinion is based upon a fundamental misunderstanding of these two different approaches by requiring the County of Fresno to correlate the project's *criteria* pollution emissions with *local* health impacts. In doing

---

<sup>6</sup> CEQA does not require speculation. *See, e.g., Laurel Heights Improvement Ass'n v. Regents of Univ. of Cal.*, 6 Cal. 4th 1112, 1137 (1993) (upholding EIR that failed to evaluate cumulative toxic air emission increases given absence of any acceptable means for doing so).

so, the Air District will provide helpful analysis to support its position that at least insofar as criteria pollutants are concerned, CEQA does not require an EIR to correlate a project's air quality emissions to specific health impacts, because such an analysis is not reasonably feasible.

**Rule 8.520 Disclosure**

Pursuant to Cal. R. 8.520(f)(4), neither the Plaintiffs nor the Defendant or Real Party In Interest or their respective counsel authored this brief in whole or in part. Neither the Plaintiffs nor the Defendant or Real Party in Interest or their respective counsel made any monetary contribution towards or in support of the preparation of this brief.

**CONCLUSION**

On behalf of the San Joaquin Valley Unified Air Pollution Control District, we respectfully request that this Court accept the filing of the attached brief.

## I. INTRODUCTION.

The San Joaquin Valley Unified Air Pollution Control District (“Air District”) respectfully submits that the Court of Appeal erred when it held that the air quality analysis contained in the Environmental Impact Report (“EIR”) for the Friant Ranch development project was inadequate under the California Environmental Quality Act (“CEQA”) because it did not include an analysis of the correlation between the project’s criteria air pollutants and the potential adverse human health impacts. A close reading of the portion of the administrative record that gave rise to this issue demonstrates that the Court’s holding is based on a misunderstanding of the distinction between toxic air contaminants and criteria air pollutants.

Toxic air contaminants, also known as hazardous air pollutants, are those pollutants that are known or suspected to cause cancer or other serious health effects, such as birth defects. There are currently 189 toxic air contaminants (hereinafter referred to as “TACs”) regulated by the United States Environmental Protection Agency (“EPA”) and the states pursuant to the Clean Air Act. 42 U.S.C. § 7412. Common TACs include benzene, perchloroethylene and asbestos. *Id.* at 7412(b).

In contrast, there are only six (6) criteria air pollutants: ozone, particulate matter, carbon monoxide, nitrogen oxides, sulfur dioxide and lead. Although criteria air pollutants can also be harmful to human health,

they are distinguishable from TACs and are regulated separately. For instance, while criteria pollutants are regulated by numerous sections throughout Title I of the Clean Air Act, the regulation of TACs occurs solely under section 112 of the Act. *Compare* 42 U.S.C. §§ 7407 – 7411 & 7501 – 7515 *with* 42 U.S.C. § 7411.

The most relevant difference between criteria pollutants and TACs for purposes of this case is the manner in which human health impacts are accounted for. While it is common practice to analyze the correlation between an individual facility's TAC emissions and the expected localized human health impacts, such is not the case for criteria pollutants. Instead, the human health impacts associated with criteria air pollutants are analyzed and taken into consideration when EPA sets the national ambient air quality standard ("NAAQS") for each criteria pollutant. 42 U.S.C. § 7409(b)(1). The health impact of a particular criteria pollutant is analyzed on a regional and not a facility level based on how close the area is to complying with (attaining) the NAAQS. Accordingly, while the type of individual facility / health impact analysis that the Court of Appeal has required is a customary practice for TACs, it is not feasible to conduct a similar analysis for criteria air pollutants because currently available computer modeling tools are not equipped for this task.

It is clear from a reading of both the administrative record and the Court of Appeal's decision that the Court did not have the expertise to fully

appreciate the difference between TACs and criteria air pollutants. As a result, the Court has ordered the County of Fresno to conduct an analysis that is not practicable and not likely yield valid information. The Air District respectfully requests that this portion of the Court of Appeal's decision be reversed.

**II. THE COURT OF APPEAL ERRED IN FINDING THE FRIANT RANCH EIR INADEQUATE FOR FAILING TO ANALYZE THE SPECIFIC HUMAN HEALTH IMPACTS ASSOCIATED CRITERIA AIR POLLUTANTS.**

Although the Air District does not take lightly the amount of air emissions at issue in this case, it submits that the Court of Appeal got it wrong when it required Fresno County to revise the Friant Ranch EIR to include an analysis correlating the criteria air pollutant emissions associated with the project with specific, localized health-impacts. The type of analysis the Court of Appeal has required will not yield reliable information because currently available modeling tools are not well suited for this task. Further, in reviewing this issue de novo, the Court of Appeal failed to appreciate that it lacked the scientific expertise to appreciate the significant differences between a health risk assessment commonly performed for toxic air contaminants and a similar type of analysis it felt should have been conducted for criteria air pollutants.

///

///

**A. Currently Available Modeling Tools are not Equipped to Provide a Meaningful Analysis of the Correlation between an Individual Development Project's Air Emissions and Specific Human Health Impacts.**

In order to appreciate the problematic nature of the Court of Appeals' decision requiring a health risk type analysis for criteria air pollutants, it is important to understand how the relevant criteria pollutants (ozone and particulate matter) are formed, dispersed and regulated.

Ground level ozone (smog) is not directly emitted into the air, but is formed when precursor pollutants such as oxides of nitrogen (NO<sub>x</sub>) and volatile organic compounds (VOCs) are emitted into the atmosphere and undergo complex chemical reactions in the process of sunlight.<sup>1</sup> Once formed, ozone can be transported long distances by wind.<sup>2</sup> Because of the complexity of ozone formation, a specific tonnage amount of NO<sub>x</sub> or VOCs emitted in a particular area does not equate to a particular concentration of ozone in that area. In fact, even rural areas that have relatively low tonnages of emissions of NO<sub>x</sub> or VOCs can have high levels of ozone concentration simply due to wind transport.<sup>3</sup> Conversely, the San Francisco Bay Area has six times more NO<sub>x</sub> and VOC emissions per square mile than the San Joaquin Valley, but experiences lower

---

<sup>1</sup> See United States Environmental Protection Agency, *Ground-level Ozone: Basic Information*, available at: <http://www.epa.gov/airquality/ozonepollution/basic.html> (visited March 10, 2015).

<sup>2</sup> *Id.*

<sup>3</sup> *Id.*

concentrations of ozone (and better air quality) simply because sea breezes disperse the emissions.<sup>4</sup>

Particulate matter (“PM”) can be divided into two categories: directly emitted PM and secondary PM.<sup>5</sup> While directly emitted PM can have a localized impact, the tonnage emitted does not always equate to the local PM concentration because it can be transported long distances by wind.<sup>6</sup> Secondary PM, like ozone, is formed via complex chemical reactions in the atmosphere between precursor chemicals such as sulfur dioxides (SO<sub>x</sub>) and NO<sub>x</sub>.<sup>7</sup> Because of the complexity of secondary PM formation, the tonnage of PM-forming precursor emissions in an area does not necessarily result in an equivalent concentration of secondary PM in that area.

The disconnect between the *tonnage* of precursor pollutants (NO<sub>x</sub>, SO<sub>x</sub> and VOCs) and the *concentration* of ozone or PM formed is important because it is not necessarily the tonnage of precursor pollutants that causes human health effects, but the concentration of resulting ozone or PM. Indeed, the national ambient air quality standards (“NAAQS”), which are statutorily required to be set by the United States Environmental Protection

<sup>7</sup> *Id.*

Agency (“EPA”) at levels that are “requisite to protect the public health,” 42 U.S.C. § 7409(b)(1), are established as concentrations of ozone or particulate matter and not as tonnages of their precursor pollutants.<sup>8</sup>

Attainment of a particular NAAQS occurs when the concentration of the relevant pollutant remains below a set threshold on a consistent basis throughout a particular region. For example, the San Joaquin Valley attained the 1-hour ozone NAAQS when ozone concentrations remained at or below 0.124 parts per million Valley-wide on 3 or fewer days over a 3-year period.<sup>9</sup> Because the NAAQS are focused on achieving a particular concentration of pollution region-wide, the Air District’s tools and plans for attaining the NAAQS are regional in nature.

For instance, the computer models used to simulate and predict an attainment date for the ozone or particulate matter NAAQS in the San Joaquin Valley are based on regional inputs, such as regional inventories of precursor pollutants (NO<sub>x</sub>, SO<sub>x</sub> and VOCs) and the atmospheric chemistry and meteorology of the Valley.<sup>10</sup> At a very basic level, the models simulate future ozone or PM levels based on predicted changes in precursor

<sup>10</sup> *Id.* at Ch. 2 p. 2-19 (visited March 12, 2015); *San Joaquin Valley Unified Air Pollution Control District 2008 PM<sub>2.5</sub> Plan*, Appendix F, pp. F-2 – F-5, available at: [http://www.valleyair.org/Air\\_Quality\\_Plans/docs/AQ\\_Final\\_Adopted\\_PM2.5/20%20Appendix%20F.pdf](http://www.valleyair.org/Air_Quality_Plans/docs/AQ_Final_Adopted_PM2.5/20%20Appendix%20F.pdf) (visited March 19, 2015).

emissions Valley wide.<sup>11</sup> Because the NAAQS are set levels necessary to protect human health, the closer a region is to attaining a particular NAAQS, the lower the human health impact is from that pollutant.

The goal of these modeling exercises is not to determine whether the emissions generated by a particular factory or development project will affect the date that the Valley attains the NAAQS. Rather, the Air District's modeling and planning strategy is regional in nature and based on the extent to which *all* of the emission-generating sources in the Valley (current and future) must be controlled in order to reach attainment.<sup>12</sup>

Accordingly, the Air District has based its thresholds of significance for CEQA purposes on the levels that scientific and factual data demonstrate that the Valley can accommodate without affecting the attainment date for the NAAQS.<sup>13</sup> The Air District has tied its CEQA significance thresholds to the level at which stationary pollution sources permitted by the Air District must "offset" their emissions.<sup>14</sup> This "offset"

---

<sup>11</sup> *Id.*

<sup>12</sup> Although the Air District does have a dispersion modeling tool used during its air permitting process that is used to predict whether a particular project's directly emitted PM will either cause an exceedance of the PM NAAQS or contribute to an existing exceedance, this model bases the prediction on a worst case scenario of emissions and meteorology and has no provision for predicting any associated human health impacts. Further, this analysis is only performed for stationary sources (factories, oil refineries, etc.) that are required to obtain a New Source Review permit from the Air District and not for development projects such as Friant Ranch over which the Air District has no preconstruction permitting authority. See San Joaquin Valley Unified Air Pollution Control District Rule 2201 §§ 2.0; 3.3.9; 4.14.1, available at: <http://www.valleyair.org/rules/currntrules/Rule22010411.pdf> (visited March 19, 2015).

<sup>13</sup> *San Joaquin Valley Unified Air Pollution Control District Guide to Assessing and Mitigating Air Quality Impacts*, (March 19, 2015) p. 22, available at: <http://www.valleyair.org/transportation/CEQA%20Rules/GAMAQI%20Jan%202002%20Rev.pdf> (visited March 30, 2015).

<sup>14</sup> *Id.* at pp. 22, 25.

level allows for growth while keeping the cumulative effects of all new sources at a level that will not impede attainment of the NAAQS.<sup>15</sup> In the Valley, these thresholds are 15 tons per year of PM, and 10 tons of NOx or VOC per year. *Sierra Club, supra*, 172 Cal.Rptr.3d at 303; AR 4554. Thus, the CEQA air quality analysis for criteria pollutants is not really a localized, project-level impact analysis but one of regional, “cumulative impacts.”

Accordingly, the significance thresholds applied in the Friant Ranch EIR (15 tons per year of PM and 10 tons of NOx or VOCs) are not intended to be indicative of any localized human health impact that the project may have. While the health effects of air pollution are of primary concern to the Air District (indeed, the NAAQS are established to protect human health), the Air District is simply not equipped to analyze whether and to what extent the criteria pollutant emissions of an individual CEQA project directly impact human health in a particular area. This is true even for projects with relatively high levels of emissions of criteria pollutant precursor emissions.

For instance, according to the EIR, the Friant Ranch project is estimated to emit 109.52 tons per year of ROG (VOC), 102.19 tons per year of NOx, and 117.38 tons per year of PM. Although these levels well

---

<sup>15</sup> <sup>15</sup> *San Joaquin Valley Unified Air Pollution Control District Environmental Review Guidelines* (Aug. 2000) p. 4-11, available at: [http://www.valleyair.org/transportation/CEQA%20Rules/ERG%20Adopted%20August%202000\\_.pdf](http://www.valleyair.org/transportation/CEQA%20Rules/ERG%20Adopted%20August%202000_.pdf) (visited March 12, 2015).

exceed the Air District's CEQA significance thresholds, this does not mean that one can easily determine the concentration of ozone or PM that will be created at or near the Friant Ranch site on a particular day or month of the year, or what specific health impacts will occur. Meteorology, the presence of sunlight, and other complex chemical factors all combine to determine the ultimate concentration and location of ozone or PM. This is especially true for a project like Friant Ranch where most of the criteria pollutant emissions derive not from a single "point source," but from area wide sources (consumer products, paint, etc.) or mobile sources (cars and trucks) driving to, from and around the site.

In addition, it would be extremely difficult to model the impact on NAAQS attainment that the emissions from the Friant Ranch project may have. As discussed above, the currently available modeling tools are equipped to model the impact of *all* emission sources in the Valley on attainment. According to the most recent EPA-approved emission inventory, the NO<sub>x</sub> inventory for the Valley is for the year 2014 is 458.2 tons per day, or 167,243 tons per year and the VOC (or ROG) inventory is 361.7 tons per day, or 132,020.5 tons per year.<sup>16</sup> Running the photochemical grid model used for predicting ozone attainment with the

---

<sup>16</sup> *San Joaquin Valley Unified Air Pollution Control District 2007 Ozone Plan*, Appendix B pp. B-6, B-9, available at: [http://www.valleyair.org/Air\\_Quality\\_Plans/docs/AO\\_Ozone\\_2007\\_Adopted/19%20Appendix%20B%20April%202007.pdf](http://www.valleyair.org/Air_Quality_Plans/docs/AO_Ozone_2007_Adopted/19%20Appendix%20B%20April%202007.pdf) (visited March 12, 2015).

emissions solely from the Friant Ranch project (which equate to less than one-tenth of one percent of the total NOx and VOC in the Valley) is not likely to yield valid information given the relative scale involved.

Finally, even once a model is developed to accurately ascertain local increases in concentrations of photochemical pollutants like ozone and some particulates, it remains impossible, using today's models, to correlate that increase in concentration to a specific health impact. The reason is the same: such models are designed to determine regional, population-wide health impacts, and simply are not accurate when applied at the local level.

For these reasons, it is not the norm for CEQA practitioners, including the Air District, to conduct an analysis of the localized health impacts associated with a project's criteria air pollutant emissions as part of the EIR process. When the accepted scientific method precludes a certain type of analysis, "the court cannot impose a legal standard to the contrary." *Kings County Farm Bureau v. City of Hanford* (1990) 221 Cal.App.3d 692, 717 n. 8. However, that is exactly what the Court of Appeal has done in this case. Its decision upends the way CEQA air quality analysis of criteria pollutants occurs and should be reversed.

///

///

///

**B. The Court of Appeal Improperly Extrapolated a Request for a Health Risk Assessment for Toxic Air Contaminants into a Requirement that the EIR contain an Analysis of Localized Health Impacts Associated with Criteria Air Pollutants.**

The Court of Appeal's error in requiring the new health impact analysis for criteria air pollutants clearly stems from a misunderstanding of terms of art commonly used in the air pollution field. More specifically, the Court of Appeal (and Appellants Sierra Club et al.) appear to have confused the health risk analysis ("HRA") performed to determine the health impacts associated with a project's toxic air contaminants ("TACs"), with an analysis correlating a project's criteria air pollutants (ozone, PM and the like) with specific localized health impacts.

The first type of analysis, the HRA, is commonly performed during the Air District's stationary source permitting process for projects that emit TACs and is, thus, incorporated into the CEQA review process. An HRA is a comprehensive analysis to evaluate and predict the dispersion of TACs emitted by a project and the potential for exposure of human populations. It also assesses and quantifies both the individual and population-wide health risks associated with those levels of exposure. There is no similar analysis conducted for criteria air pollutants. Thus, the second type of analysis (required by the Court of Appeal), is not currently part of the Air District's process because, as outlined above, the health risks associated

with exposure to criteria pollutants are evaluated on a regional level based on the region's attainment of the NAAQS.

The root of this confusion between the types of analyses conducted for TACs versus criteria air pollutants appears to stem from a comment that was presented to Fresno County by the City of Fresno during the administrative process.

In its comments on the draft EIR, the City of Fresno (the only party to raise this issue) stated:

[t]he EIR must disclose the human health related effects of the Project's air pollution impacts. (CEQA Guidelines section 15126.2(a).) The EIR fails completely in this area. The EIR should be revised to disclose and determine the significance of TAC impacts, and of human health risks due to exposure to Project-related air emissions.

(AR 4602.)

In determining that the issue regarding the correlation between the Friant Ranch project's criteria air pollutants and adverse health impacts was adequately exhausted at the administrative level, the Court of Appeal improperly read the first two sentences of the City of Fresno's comment in isolation rather than in the context of the entire comment. *See Sierra Club v. County of Fresno* (2014) 172 Cal.Rptr.3d 271, 306. Although the comment first speaks generally in terms of "human health related effects" and "air pollution," it requests only that the EIR be revised to disclose "the significance of TACs" and the "human health risks due to exposure."

The language of this request in the third sentence of the comment is significant because, to an air pollution practitioner, the language would only have indicated only that a HRA for TACs was requested, and not a separate analysis of the health impacts associated with the project's criteria air pollutants. Fresno County clearly read the comment as a request to perform an HRA for TACs and limited its response accordingly. (AR 4602.)<sup>17</sup> The Air District submits that it would have read the City's comment in the same manner as the County because the City's use of the terms "human health risks" and "TACs" signal that an HRA for TACs is being requested. Indeed, the Air District was also concerned that an HRA be conducted, but understood that it was not possible to conduct such an analysis until the project entered the phase where detailed site specific information, such as the types of emission sources and the proximity of the sources to sensitive receptors became available. (AR 4553.)<sup>18</sup> The City of Fresno was apparently satisfied with the County's discussion of human health risks, as it did not raise the issue again when it commented on the final EIR. (AR 8944 – 8960.)

---

<sup>17</sup> Appellants do not challenge the manner in which the County addressed TACs in the EIR. (Appellants' Answer Brief p. 28 fn. 7.)

<sup>18</sup> Appellants rely on the testimony of Air District employee, Dan Barber, as support for their position that the County should have conducted an analysis correlating the project's criteria air pollutant emissions with localized health impacts. (Appellants Answer Brief pp. 10-11; 28.) However, Mr. Barber's testimony simply reinforces the Air District's concern that a risk assessment (HRA) be conducted once the actual details of the project become available. (AR 8863.) As to criteria air pollutants, Mr. Barber's comments are aimed at the Air District's concern about the amount of emissions and the fact that the emissions will make it "more difficult for Fresno County and the Valley to reach attainment which means that the health of Valley residents maybe [sic] adversely impacted." Mr. Barber says nothing about conducting a separate analysis of the localized health impacts the project's emissions may have.

The Court of Appeal's holding, which incorrectly extrapolates a request for an HRA for TACs into a new analysis of the localized health impacts of the project's criteria air pollutants, highlights two additional errors in the Court's decision.

First, the Court of Appeal's holding illustrates why the Court should have applied the deferential substantial evidence standard of review to the issue of whether the EIR's air quality analysis was sufficient. The regulation of air pollution is a technical and complex field and the Court of Appeal lacked the expertise to fully appreciate the difference between TACs and criteria air pollutants and tools available for analyzing each type of pollutant.

Second, it illustrates that the Court likely got it wrong when it held that the issue regarding the criteria pollutant / localized health impact analysis was properly exhausted during the administrative process. In order to preserve an issue for the court, '[t]he "exact issue" must have been presented to the administrative agency....' [Citation.] *Citizens for Responsible Equitable Environmental Development v. City of San Diego*, (2011) 196 Cal.App.4th 515, 527 129 Cal.Rptr.3d 512, 521; *Sierra Club v. City of Orange* (2008) 163 Cal.App.4th 523, 535, 78 Cal.Rptr.3d 1, 13. "[T]he objections must be sufficiently specific so that the agency has the

opportunity to evaluate and respond to them.’ [Citation.]” *Sierra Club v. City of Orange*, 163 Cal.App.4<sup>th</sup> at 536.<sup>19</sup>

As discussed above, the City’s comment, while specific enough to request a commonly performed HRA for TACs, provided the County with no notice that it should perform a new type of analysis correlating criteria pollutant tonnages to specific human health effects. Although the parties have not directly addressed the issue of failure to exhaust administrative remedies in their briefs, the Air District submits that the Court should consider how it affects the issues briefed by the parties since “[e]xhaustion of administrative remedies is a jurisdictional prerequisite to maintenance of a CEQA action.” *Bakersfield Citizens for Local Control v. City of Bakersfield* (2004) 124 Cal.App.4<sup>th</sup> 1184, 1199, 22 Cal.Rptr.3d 203.

### III. CONCLUSION

For all of the foregoing reasons, the Air District respectfully requests that the portion of the Court of Appeal’s decision requiring an analysis correlating the localized human health impacts associated with an individual project’s criteria air pollutant emissions be reversed.

---

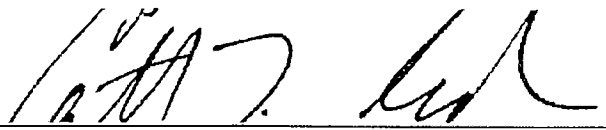

<sup>19</sup> *Sierra Club v. City of Orange*, is illustrative here. In that case, the plaintiffs challenged an EIR approved for a large planned community on the basis that the EIR improperly broke up the various environmental impacts by separate project components or “piecemealed” the analysis in violation of CEQA. In evaluating the defense that the plaintiffs had failed to adequately raise the issue at the administrative level, the Court held that comments such as “*the use of a single document for both a project-level and a program-level EIR [is] ‘confusing’*,” and “[t]he lead agency should identify any potential adverse air quality impacts that could occur from all phases of the project and all air pollutant sources related to the project,” were too vague to fairly raise the argument of piecemealing before the agency. *Sierra Club v. City of Orange*, 163 Cal.App.4<sup>th</sup> at 537.

correlating the localized human health impacts associated with an individual project's criteria air pollutant emissions be reversed.

Respectfully submitted,

Dated: April 2, 2015

HOW THIS BRIEF WILL ASSIST THE COURT ..... App-1

STATEMENT OF INTEREST OF *AMICUS CURIAE*..... App-3

CERTIFICATION REGARDING AUTHORSHIP & FUNDING ..... App-4

BRIEF OF AMICUS CURIAE..... 1

SUMMARY OF ARGUMENT ..... 1

ARGUMENT ..... 2

I. RELEVANT FACTUAL AND LEGAL FRAMEWORK. .... 2

    A. Air Quality Regulatory Background .....2

    B. The SCAQMD's Role Under CEQA..... 6

II. THIS COURT SHOULD NOT SET A HARD-AND-FAST  
RULE CONCERNING THE EXTENT TO WHICH AN EIR  
MUST CORRELATE A PROJECT'S EMISSION OF  
POLLUTANTS WITH RESULTING HEALTH IMPACTS..... 8

III. THE QUESTION OF WHETHER AN EIR CONTAINS  
SUFFICIENT ANALYSIS TO MEET CEQA'S  
REQUIREMENTS IS A MIXED QUESTION OF FACT  
AND LAW GOVERNED BY TWO DIFFERENT  
STANDARDS OF REVIEW..... 16

    A. Standard of Review for Feasibility Determination and  
Sufficiency as an Informative Document ..... 16

    B. Friant Ranch's Rationale for Rejecting the Independent  
Judgment Standard of Review is Unsupported by Case  
Law..... 23

IV. COURTS MUST SCRUPULOUSLY ENFORCE THE  
REQUIREMENTS THAT LEAD AGENCIES CONSULT  
WITH AND OBTAIN COMMENTS FROM AIR  
DISTRICTS..... 26

CONCLUSION ..... 29

**TO THE HONORABLE CHIEF JUSTICE AND JUSTICES OF THE  
SUPREME COURT:**

**APPLICATION FOR LEAVE TO FILE *AMICUS CURIAE* BRIEF**

Pursuant to Rule 8.520(f) of the California Rules of Court, the South Coast Air Quality Management District (SCAQMD) respectfully requests leave to file the attached *amicus curiae* brief. Because SCAQMD's position differs from that of either party, we request leave to submit this *amicus* brief in support of neither party.

**HOW THIS BRIEF WILL ASSIST THE COURT**

SCAQMD's proposed *amicus* brief takes a position on two of the issues in this case. In both instances, its position differs from that of either party. The issues are:

- 1) Does the California Environmental Quality Act (CEQA) require an environmental impact report (EIR) to correlate a project's air pollution emissions with specific levels of health impacts?
- 2) What is the proper standard of review for determining whether an EIR provides sufficient information on the health impacts caused by a project's emission of air pollutants?

This brief will assist the Court by discussing the practical realities of correlating identified air quality impacts with specific health outcomes. In short, CEQA requires agencies to provide detailed information about a project's air quality impacts that is sufficient for the public and decisionmakers to adequately evaluate the project and meaningfully understand its impacts. However, the level of analysis is governed by a rule of reason; CEQA only requires agencies to conduct analysis if it is reasonably feasible to do so.

With regard to health-related air quality impacts, an analysis that correlates a project's air pollution emissions with specific levels of health impacts will be feasible in some cases but not others. Whether it is feasible depends on a variety of factors, including the nature of the project and the nature of the analysis under consideration. The feasibility of analysis may also change over time as air districts and others develop new tools for measuring projects' air quality related health impacts. Because SCAQMD has among the most sophisticated air quality modeling and health impact evaluation capability of any of the air districts in the State, it is uniquely situated to express an opinion on the extent to which the Court should hold that CEQA requires lead agencies to correlate air quality impacts with specific health outcomes.

SCAQMD can also offer a unique perspective on the question of the appropriate standard of review. SCAQMD submits that the proper standard of review for determining whether an EIR is sufficient as an informational document is more nuanced than argued by either party. In our view, this is a mixed question of fact and law. It includes determining whether additional analysis is feasible, which is primarily a factual question that should be reviewed under the substantial evidence standard. However, it also involves determining whether the omission of a particular analysis renders an EIR insufficient to serve CEQA's purpose as a meaningful, informational document. If a lead agency has not determined that a requested analysis is infeasible, it is the court's role to determine whether the EIR nevertheless meets CEQA's purposes, and courts should not defer to the lead agency's conclusions regarding the legal sufficiency of an EIR's analysis. The ultimate question of whether an EIR's analysis is "sufficient" to serve CEQA's informational purposes is predominately a question of law that courts should review *de novo*.

This brief will explain the rationale for these arguments and may assist the Court in reaching a conclusion that accords proper respect to a lead agency's factual conclusions while maintaining judicial authority over the ultimate question of what level of analysis CEQA requires.

#### **STATEMENT OF INTEREST OF *AMICUS CURIAE***

The SCAQMD is the regional agency primarily responsible for air pollution control in the South Coast Air Basin, which consists of all of Orange County and the non-desert portions of the Los Angeles, Riverside, and San Bernardino Counties. (Health & Saf. Code § 40410; Cal. Code Regs., tit. 17, § 60104.) The SCAQMD participates in the CEQA process in several ways. Sometimes it acts as a lead agency that prepares CEQA documents for projects. Other times it acts as a responsible agency when it has permit authority over some part of a project that is undergoing CEQA review by a different lead agency. Finally, SCAQMD also acts as a commenting agency for CEQA documents that it receives because it is a public agency with jurisdiction by law over natural resources affected by the project.

In all of these capacities, SCAQMD will be affected by the decision in this case. SCAQMD sometimes submits comments requesting that a lead agency perform an additional type of air quality or health impacts analysis. On the other hand, SCAQMD sometimes determines that a particular type of health impact analysis is not feasible or would not produce reliable and informative results. Thus, SCAQMD will be affected by the Court's resolution of the extent to which CEQA requires EIRs to correlate emissions and health impacts, and its resolution of the proper standard of review.
